Travelli approached the last Russian packing his belongings, a low-level scientist who had been quiet at the meeting.

"I'd like to see the pictures," Travelli said. "When might there be pictures?"

The man leaned down and pulled three 8-by-10, black-and-white photographs from his briefcase, then put them on the table.

Travelli picked them up. One by one, he studied them, knowing that America's future—and his own—was at stake.

A top nuclear physicist, Travelli had spent the last quarter-century trying to bring home weapons-grade uranium America had supplied to dozens of nations in an ill-conceived program launched by President Dwight Eisenhower called Atoms for Peace.

Toiling in the twilight zone where hard science and clandestine missions intersect, Travelli had weathered congressional indifference to his project, research budgets set at zero and, by some accounts, his own missteps.

A persuasive scientist-diplomat, he had even managed to patch together a promising solution with the scant resources at his disposal. The question was whether it would work.

Or was he banking too much on unproven science and his own ability to charm the Russians, other foreigners—even his own bosses?

Turning to science for a solution

Nuclear research reactors are like sports cars: They run faster with a high-octane fuel—in this case, highly enriched uranium.

A powerfully fueled reactor can conduct an experiment in a week; a poorly fueled one could take a month. For private reactor operators producing and selling radioisotopes for medical uses, such as cancer radiation, that gap can mean the difference between profit and loss.

The challenge facing Travelli and his team of Argonne scientists was to invent a fuel strong enough to satisfy reactor operators, but weak enough to be useless to terrorists trying to build a nuclear weapon.

By the early 1990s, Travelli's team had solved this riddle for many reactors around the globe. He carefully noted each success story by replacing a green triangular magnet with a red one on a large metallic world map in his office.

But dozens of other reactors still would not operate on anything but bomb-grade fuel. And because none of these reactors were precisely the same, the Argonne scientists faced the overwhelming task of inventing a special fuel for each one.

Plus, dozens of reactors worldwide used bomb-grade fuel supplied by Russia, and no one was addressing those.

So in 1993 Travelli traveled to Moscow and eventually helped cut a groundbreaking deal: U.S. and Russian scientists would team together to craft a single, all-purpose fuel that would work in all the reactors, regardless of make, model or country of origin.

To do that, they had to make a fuel with a low percentage of uranium-235, the potent isotope behind the atomic chain reaction that causes nuclear explosions.

U-235 is unsteady, so the trick was to find some way to stabilize it while packing it densely enough to give the fuel the necessary power. Travelli's team knew that adding certain elements could calm the uranium; his team tested more than 20 before deciding to stake their work on molybdenum, a hard, gray metal used to strengthen steel.

Officially, this exotic, experimental mixture was called "uranium-molybdenum dispersion fuel." For the cause of disarming the threat of nuclear terrorism, Travelli's team hoped it would be the magic fuel.

Unlike race cars, reactors run on solid fuels; that meant Argonne scientists were using metals, powders and plates. They knew the tiniest mistake in making a nuclear fuel invited failure. "It's not a blacksmith's job, that's for sure," said Jim Snelgrove, a fuel specialist at Argonne.

Work began in earnest. Argonne scientists melted together chunks of uranium and molybdenum, machined the mixture into powder, added aluminum, then pressed and rolled the metal into thin, shiny plates the size of credit cards. These miniature fuel plates were placed in a research reactor in Idaho for a full year of testing. The radioactive plates then returned to Argonne in special casks inside a hazmat truck.

Workers wearing protective bodysuits and using mechanical arms cut the plates with fine instruments and photographed the pieces under an electron microscope. The early results were encouraging: no evidence of cracks, swelling or bubbling.

But the same couldn't be said of the U.S.-Russian partnership.

It quickly began splintering. The Russian scientists, still suspicious from the recent Soviet past, were hesitant to share information, turning in lab reports that offered scant detail. Later, they accused Travelli's team of trying to steal their technology.

Further complicating matters, the U.S. in 1999 placed economic sanctions on Travelli's partner in Russia, a nuclear contractor called NIKIET, for allegedly providing "sensitive missile or nuclear assistance" to Iran.

Travelli struggled to find a new lab, at one point appealing to his influential friend in the Russian nuclear bureaucracy, Nikolay Arkhangelsky. But Arkhangelsky demurred, upset like his colleagues at the U.S. sanctions.

After nearly two years and three more trips to Moscow, Travelli finally found a new laboratory. Work on the magic fuel picked up dramatically.

One night, after reviewing the Russians' progress at a Moscow lab, Travelli was walking down the hallway of his hotel when Gerard Hofman, a fuel development specialist at Argonne, called him into his room.

"I think you'd better see this," he said.

Travelli's eyes locked on the TV as the World Trade Center towers crashed to the ground.

U.S. misses wake-up call

In the tense weeks that followed Sept. 11, many wondered whether terrorists could obtain an atomic weapon, whether a bomb could fit into a suitcase, whether the U.S. was doing enough to prevent a nuclear catastrophe.

But the American government didn't intensify efforts to retrieve uranium.

U.S. officials didn't call emergency meetings. Congress didn't hold hearings on the issue. President Bush and Capitol Hill didn't even provide more money for the effort.

The program's budget stayed flat at $5.6 million.

The lack of action exasperated those who knew that the highly enriched uranium scattered around the globe was the quickest way for Al Qaeda or other terrorists to build a crude nuclear device.

Jack Edlow, whose company, Edlow International, ships nuclear fuel back to the U.S., was in his Washington office on Sept. 11. He looked out his back window and saw smoke rising from the Pentagon.

"I thought they would get themselves a couple of hundred million dollars, and we would get the whole thing cleaned up in a couple of years," Edlow recalled. "I thought everybody would say, 'Let's go get this stuff before it comes back to haunt us.' "

Eleven months after the terrorist attacks, the U.S. did manage to remove two nuclear bombs' worth of uranium from Serbia and ship it back to Russia. But to pay for the mission, the State Department asked the Nuclear Threat Initiative, a non-profit group founded by Ted Turner and former Georgia Sen. Sam Nunn, to donate $5 million; that was more money than the government contributed to the mission.

Even after Sept. 11, America was relying on funding from a non-profit for critical national security work.

"It was embarrassing," recalled Allan Krass, a State Department official involved in the operation. But officials, he said, had no choice: "We needed the money."

Cracks begin to surface

After the terrorist attacks, Travelli felt more pressure than ever to succeed. That feeling intensified when he learned a competing team of French scientists was trying to invent a nearly identical magic fuel.

Throughout 2002, the French and the U.S.-Russian teams both reported great progress with their fuels, predicting the material would be ready for reactors in three years. They were so confident they began planning training seminars so other nations could learn about the fuel ence in Aix-en-Provence, France, in 2003, Travelli's team and the French scientists told colleagues and the trade press that their separate fuel programs were right on track.

But privately, the French were telling a far different story, Travelli recalled.

They pulled Travelli's team aside at the convention center and laid out pictures of their latest tests. The often-unstable uranium particles looked fine. But there were bizarre, meandering cracks—like the hairline fractures of a bone—in the aluminum portion of the fuel in which the uranium particles were embedded. Travelli had never seen anything like it.

The French fuel was failing.

Alarmed, Travelli and his team flew back to Chicago and immediately began sifting through dozens of photos of their own tests. Was it possible their fuel had the same problems, but they had somehow missed it?

Sure enough, they began to recognize tiny little bubbles—almost imperceptible—inside the fuel plates. They were aligned in such a way that if the Americans were to jump ahead with advanced testing as the French had, the tiny bubbles would likely multiply and connect, forming the same cracks seen in France.

Travelli's Russian partners hadn't run any tests yet. But his former partners had.

NIKIET, the Russian nuclear contractor still under U.S. sanctions, was quietly developing its own reactor fuel. Travelli had heard NIKIET was experiencing similar failures as seen in France.

Aware of the dire implications, Travelli's team flew to Moscow in December 2003 to see if it could learn of NIKIET's results.

The crucial meeting was held at the Bochvar Institute, the lab working with Travelli. His Russian allies from the lab and the government were on hand. NIKIET, barred from contact with the Americans, was represented at the meeting by subcontractors.

After the Russians assured Travelli that there were only minor problems with the NIKIET fuel, they walked out of the meeting. But the last one to leave pulled out detailed pictures of the tests from his briefcase and gave them to Travelli.

He studied each of the three photographs carefully. He could see the small meandering lines in the aluminum portion of the fuel, just as he had seen in France.

The evidence now was overwhelming: The magic fuel was a bust.

Feeling as though his life's work had collapsed, Travelli returned to his hotel. A few minutes later, the phone rang. It was a State Department official. He wanted an update.

Back in America, a bitter fallout

After his dream fuel failed, everything changed for Travelli.

In the summer of 2004, Energy Department officials began taking firmer control of America's effort to retrieve bomb fuel. They wanted it run out of Washington, not Chicago. They wanted the fuel work managed out of a federal lab in Idaho, not Argonne. They wanted new scientists involved, not the same group that had been leading it the last 26 years.

And three years after the Sept. 11 attacks, they finally asked to double the budget.

Travelli heard about these changes piecemeal. Then one day, an Argonne administrator, Phillip Finck, called him into his office. Finck told the longtime scientist that energy officials wanted him out. He could stay on as a scientific adviser, but an Argonne colleague would replace him.

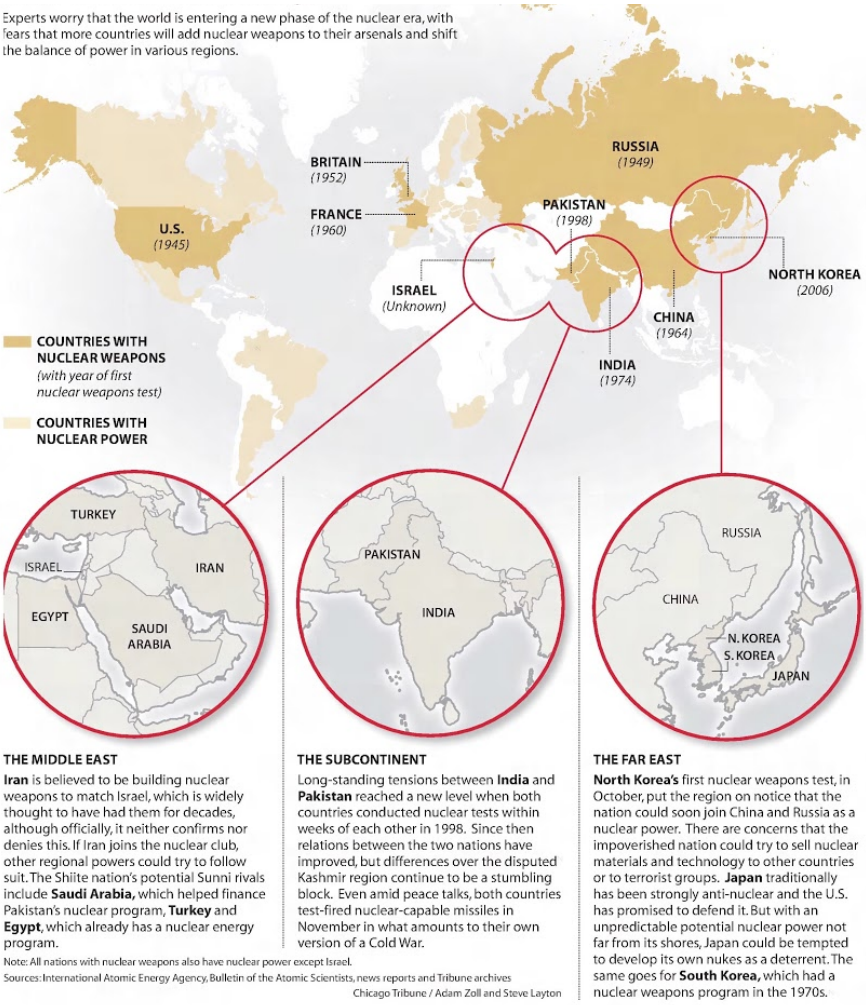
Moreover, energy officials wanted Travelli to make this announcement that weekend at a conference in Vienna—one that Travelli himself had organized.

Travelli was stunned. He had fought to keep the effort alive for nearly three decades, often in the face of little support. Now that Sept. 11 had finally moved his work to the top of the national security agenda, he was supposed to step down?

Travelli balked.

But Finck, Travelli recalled, told him he didn't really have a choice; funding from the Energy Department was at stake.

Five days later in Vienna, at a jammed conference with dozens of familiar faces, Travelli an-



Tribune photo by Zbigniew Bzdak

Armando Travelli of Argonne National Laboratory had staked his future on developing a single fuel that could replace the highly enriched uranium at research reactors around the world.

Electronic Arrays 9002 (EA9002) was a microprocessor released in 1976.[3][1]

It was an 8-bit NMOS CPU, with an instruction set influenced by the Intel 4004.[4] It had a 4096 byte address space, due to its use of 12-bit addressing.[5][6]

It was reported to have a 2 microsecond instruction fetch and execution time,[7][8] although another source says 3.2 microseconds for single byte instructions and 6.4 microseconds for two byte instructions.[9]

The EA9002 was largely unsuccessful. Its manufacturer, Electronic Arrays, struggled financially and with process issues.[10] By November 1977, Electronic Arrays had ceased active marketing of the EA9002,[11] and in 1978 it was acquired by NEC.[12][13]

Electronic Arrays supplied macro assemblers for the EA9002 for IBM 360 and National CSS mainframe systems.[2] ASM/GEN and SIM/GEN, systems for developing for cross-assemblers and simulators in FORTRAN IV, supported the EA9002 as a target.[14]

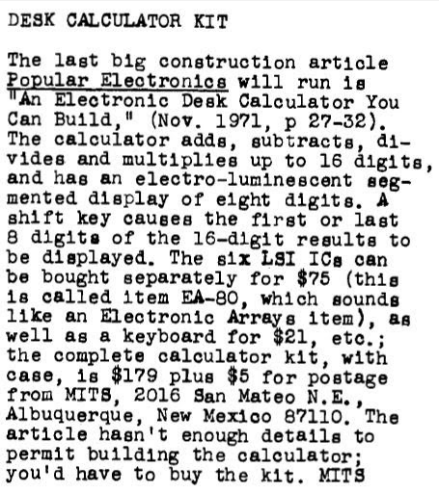
MITS 816 Electronic Calculator Introduction Article

PDF Source from Old Calculator Web Museum : MITS 816 Electronic Calculator Introduction Article : [HW004X][GDrive]



DESK CALCULATOR KIT

The last big construction article Popular Electronics will run is "An Electronic Desk Calculator You Can Build," (Nov. 1971, p 27-32). The calculator adds, subtracts, divides and multiplies up to 16 digits, and has an electro-luminescent segmented display of eight digits. A shift key causes the first or last 8 digits of the 16-digit results to be displayed. The six LSI ICs can be bought separately for $75 (this is called item EA-80, which sounds like an Electronic Arrays item), as well as a keyboard for $21, etc.; the complete calculator kit, with case, is $179 plus $5 for postage from MITS, 2016 San Mateo N.E., Albuquerque, New Mexico 87110. The article hasn't enough details to permit building the calculator; you'd have to buy the kit. MITS

[HW004Y][GDrive]
Amateur Computer Soceity Newsletter, November, 1971

Short news release announcing the publication of an article in *Popular Electronics* magazine **introducing the MITS 816 electronic calculator kit, based on the Electronic Arrays S-80 six-chip MOS large-scale integration calculator chipset. The S-80 chipset contained a change to the microcode of Electronic Arrays' original S-100 chipset that provided a different means for setting the decimal point position.**

The MITS 816 has significant historical significance, as it was the first electronic calculator to be offered as a kit that anyone with a modicum of electronics skills could put together themselves."

MITS Model 7440 Desktop Scientific Calculator

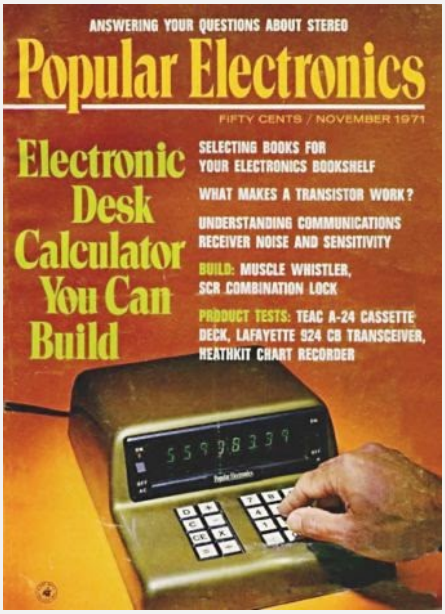
[HW004T][GDrive]
MITS Model 7440 Desktop Scientific Calculator

In the world of electronic calculators, the company named MITS may not ring bells for many people. However, those who were involved in the infancy of personal computing, or those who have an affection for the early days of personal computing know the name well. MITS, (pronounced letter at a time) is an acronym for **M**icro **I**nstrumentation and **T**elemetry **S**ystems, effectively created the "personal computer" market with the introduction of the "Altair 8800" mini-computer (as they called it) in early 1975. The Altair computer was heralded as a breakthrough in the world of computers, with a kit selling for a mere $397 in 1974. There were other "hobbyist" computers available at the time, but they were not as powerful (relying on earlier microprocessor chips), nor as well publicized as the Altair. The Altair computer was featured on the front cover of the January, 1975 edition of Popular Electronics magazine, with a series of articles on the design and construction of the machine. Orders for the Altair poured in at a tremendous rate, propelling MITS and the Altair into the spotlight of personal computer history.

MITS started up as a small four-man company in late 1969. The principals were Ed Roberts, Forrest Mims III, Stan Cagle, and Bob Zahler. In January of 1970, the company was formally incorporated. Initial discussions came to the conclusion that there was a market in the model rocketry field for various electronic devices to go up with the rocket, at first, strobe lights to aid in recovery (for night launches), and later, to provide simple radio telemetery. These devices were designed such that hobbyists could build them from a kit, or buy pre-assembled. Later, MITS developed a novel wireless "walkie talkie" that used a beam of infrared light to send voice between two transceivers, up to 1000 feet apart.



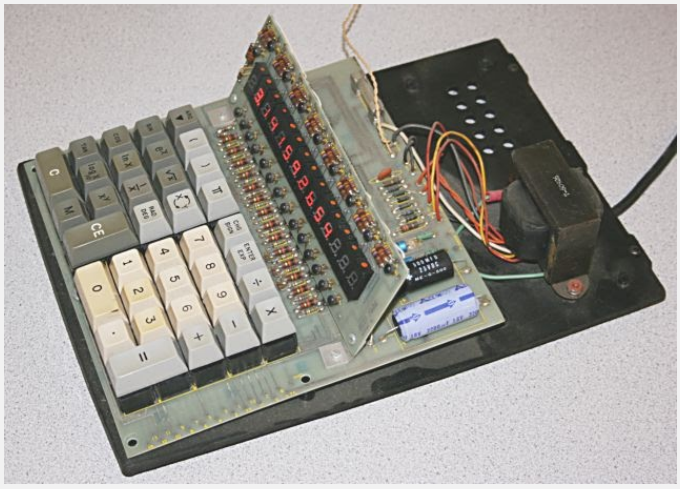
[HW004U][GDrive]
Cover of November, 1971 Popular Electronics Featuring MITS 816 Prototype

While these products generated a modest revenue, by the early part of 1971, MITS was looking for a way to break into new markets. At the same time the fledgeling Large-Scale Integration (LSI) MOS Integrated Circuit manufacturer, Electronic Arrays, had recently introduced a six-device chipset that provided a great majority of the logic for a complete four-function electronic calculator. In mid-1971, the MITS team realized that there was tremendous market potential for low-priced electronic calculators. MITS contacted Electronic Arrays to arrange for some production samples. Soon, a prototype machine was built. MITS arranged volume pricing of the chipset, further reducing the cost. Since MITS had experienced some earlier success with Ed Roberts and Forrest Mims writing articles for various hobbyist publications, especially Popular Electronics, it was hoped that the calculator could make its debut as a featured construction article in that publication. Popular Electronics was contacted, and shown the prototype of the calculator in the fall of 1971.

[HW004V][GDrive]
Production MITS 816 Calculator - Note differences between production and prototype on magazine cover above.
Photo Courtesy of Steve Shepard

The calculator was a big hit with the magazine's publishers(Ziff-Davis), and made the cover of the November, 1971 issue of the magazine, with the lead story proclaiming "Electronic Desk Calculator You Can Build". At the time, the machine was called the "Popular Electronics Calculator", but internally to MITS, this machine was designated as the model 816. The 816 could be ordered as a complete, assembled calculator for $275, or as a ready-to-build kit for $179. The model number 816 was based on the fact that the calculator had an eight-digit vacuum-fluorescent display, but could perform calculations to sixteen digits. At the time, the major players in the calculator market were charging between $400 and $600 for an electronic calculator with similar functionality.

The Electronic Arrays chipset consisted of six LSI integrated circuits containing over 8,000 transistors. The six devices had specific functions; input(keyboard processing), output(display generation), arithmetic(math processing), register storage, control ROM(microcode), and control logic. While it isn't entirely clear at this time, the chipset used in the MITS 816 appears to be the same chipset used in the ICM-816 calculator, which was introduced by a subsidiary of Electronic Arrays called International Calculating Machines, in early 1971. The ICM 816 initially sold for $495.



[HW004W][GDrive]
Inside view of MITS 7440

MITS proceeded to develop a number of other desktop (908DM and 1440), and later, handheld calculators which were sold as kits or fully-assembled. While the calculator line was initially successful, the intense competition in the marketplace, along with the introduction of single-chip calculator IC's by various large chip makers such as Texas Instruments, Rockwell and General Instruments, made it difficult for MITS to remain price-competitive in the market. There was also tough competition in the electronics kit market from Heathkit, who offered a number of high-quality build-it-yourself calculator products. By the late part of 1973, it was possible to buy a mass-market calculator fully assembled, for less than it cost to buy one of MITS 816, 1440, or 908DM desktop calculator kits.

Christopher J. Elias (born 1957)

Wikipedia Christopher Elias

Wikipedia -

Saved - [HK001X][GDrive]

https://en.wikipedia.org/wiki/Christopher_Elias

Christopher J. Elias is the former president and CEO of the Program for Appropriate Technology in Health, also known as **PATH**, a nonprofit organization that improves global health by ensuring that innovations in science and technology are available to low income groups and developing countries.

Education[edit]

Elias received his MD from Creighton University, completed his post-graduate training in internal medicine at the University of California, San Francisco, and received his MPH from the University of Washington.

Career[edit]

Elias has worked as a senior associate at the International Programs Division of the Population Council. He served as country representative of Thailand.

In October 2011, the Bill & Melinda Gates Foundation formally announced the appointment of Elias to the position of president of its global development program. In this role, Elias is responsible of leading the foundation's efforts in developing countries to overcome hunger, poverty and disease.

Other activities[edit]

- Creighton University, member of the board of trustees[1]
- Centers for Disease Control and Prevention (CDC), member of the advisory committee to the director[2]
- University of Washington, member of the global health external advisory board
- Family Planning 2020 (FP2020), co-chair of the reference group[3]
- Scaling Up Nutrition Movement, member of the lead group (since 2016, appointed by United Nations Secretary-General Ban Ki-moon)[4]

Recognition[edit]

- 2005 – Social Entrepreneur of the Year, awarded by the Schwab Foundation[5]

BIOGRAPHY

Dr. Chris Elias, leads the Gates Foundation's efforts in integrated and innovative delivery, finding creative new ways to ensure solutions and products get into the hands of people in developing countries who need them most.

Dr. Elias's professional background is in health and medicine, most recently having served as the president and CEO of PATH, an international, nonprofit organization dedicated to improving the health of people around the world by advancing technologies, strengthening systems, and encouraging healthy behaviors.

Dr. Elias holds an MD from Creighton University and an MPH from the University of Washington. He was a fellow in the Robert Wood Johnson Clinical Scholars Program and was awarded an honorary Doctor of Science degree from Creighton University. Elias currently serves on various advisory boards, including the Nike Foundation and the Duke Global Health Institute.

Christopher Elias

Christopher Elias is the President of Global Development at the Bill & Melinda Gates Foundation. Previously, he was president and CEO of PATH, a Seattle-based nonprofit organization that creates sustainable, culturally relevant solutions, enabling communities worldwide to break longstanding cycles of poor health.

Before joining PATH in 2000, Dr. Elias was a senior associate in the International Programs Division of the Population Council. For six years, he served as the country representative in Thailand, where he managed reproductive health programs throughout Southeast Asia.

He sits on the boards of the Global Alliance for Improved Nutrition, Ibis Reproductive Health, and the Washington Biomedical and Biotechnology Association, among others. He is also a member of the Policy Advisory Committee for the International AIDS Vaccine Initiative and the Advisory Committee for the Department of Global Health at the University of Washington. Dr. Elias was honored as the Schwab Foundation's Social Entrepreneur of the Year for the United States in 2005, and he remains an active member of the Schwab Foundation community.

He received his MD from Creighton University (1983), completed post-graduate training in internal medicine at the University of California, San Francisco (1986), and received an MPH from the University of Washington (1990), where he was a fellow in the Robert Wood Johnson Clinical Scholars Program.

Engelhard Corporation

Wikipedia Engelhard Corporation

Also known as "Engelhard Minerals and Chemicals Corporation"

WIKIPEDIA : 2019-04-30-wikipedia-org-engelhard.pdf / https://drive.google.com/open?id=13BBj0klUUEMBWhfbHAFXCzHVEcHC8eY_

Engelhard Corporation is a former American Fortune 500 company headquartered in Iselin, New Jersey, USA. It is credited with developing the first production catalytic converter. In 2006, the German chemical manufacturer BASF bought Engelhard for $US5 billion (5,000,000,000).

Early history

The company was started by Charles W. Engelhard, Sr. in 1902[1] when he purchased the Charles F. Croselmire Company in Newark, New Jersey. He subsequently founded the American Platinum Works in 1903 and acquired several other companies. In 1904, he purchased Baker & Co., a platinum smelting and refining business located in Newark and in 1905, he established Hanovia Chemical and Manufacturing Company also in Newark. Engelhard became the world's largest refiner and fabricator of platinum metals, gold and silver, a producer of silver and silver alloys in mill forms, operator of the world's largest precious metals smelter. They also developed liquid gold for decorative applications[*citation needed*].

Merger and spinoff of Phibro

In 1958, Engelhard's son Charles Jr. consolidated the family's holdings to form Engelhard Industries, Inc. as a publicly held company listed on the New York Stock Exchange. In 1963, Engelhard, under the advisement of Lazard Frères, took a 20 percent interest in Minerals & Chemicals Philipp (MCP), a recently formed partnership between a small producer of nonmetallic minerals such as kaolin and fuller's earth, and Philipp Brothers, a trading firm specializing in the buying and selling of ores on the international market. Engelhard executed the transaction through a stock swap, giving up 8 percent of Engelhard as partial payment for the 20 percent interest in MCP.

Sales in MCP took off soon afterwards, mostly from Philipp Brothers' fast-growing ore trading. In 1964 it had sales of $US447 million, and by 1966 sales reached $US709 million. Even though Engelhard Industries did only about 40 percent of that figure, it was able, in September 1967, to work out a merger of the two companies that left the Engelhard family controlling about 40 percent of the new company. The new entity, which was called Engelhard Minerals & Chemicals Corporation (EMCC), was structured into three divisions: Minerals & Chemicals, which processed non-metallic minerals; Engelhard Industries, which refined and fabricated precious metals; and Philipp Brothers. Nearly one-half of the company's 1967 net income of $28 million was generated by the Philipp trading division, with the Engelhard metal processing contributing 34 percent and minerals and chemicals about 19 percent.

Philipp's trading continued to enjoy phenomenal growth as the world turned to spot traders to move scarce natural resources around the globe. By 1972, EMCC's sales hit $US2 billion, about 80 percent of it supplied by Philipp, and in 1974 revenue reached $5 billion. By 1981, Philipp Brothers earned 89 percent of the total corporation's $US26.6 billion in revenues and 88 percent of its $US532.7 million in profits. Management in the slow growing minerals-and-chemicals division, along with those in precious metals, felt overshadowed by their trading counterparts. This led to the spinoff of Philipp Brothers (later called Phibro), and renaming what was left the Engelhard Corporation.

Later history

Engelhard operated a Minerals & Chemicals Division and an Engelhard Industries Division with corporate headquarters in Menlo Park, New Jersey. In 1984, the company was realigned to consist of a Specialty Chemicals Division and a Specialty Metals Division. Engelhard expanded significantly through growth, acquisitions and joint ventures. Acquisitions included the Freeport Kaolin Company in 1985; most of the business of the Harshaw/Filtrol Partnership in 1988; the auto catalysts and petroleum catalysts businesses of Solvay Catalysts GmbH, in 1992 and 1994, respectively; the Mearl Corporation in 1996; the catalyst business of Mallinckrodt Inc. in 1998; Süd Chemie's fats and oils catalyst business in 2001; and the Collaborative Group, a personal care company, in 2004.

On May 30, 2006, Engelhard was taken over by BASF after the board agreed for the takeover of BASF. BASF paid $US39 per share. The transaction totaled $5 billion.

On August 2, 2006, BASF began to rename Engelhard worldwide. This started in the USA with BASF Catalysts LLC.

On April 1, 2010, BASF Catalysts LLC became part of BASF Corporation.

Environmental record

Catalytic-converter-equipped vehicles have helped cut other air pollutants by more than 3 billion tons worldwide between 1975 and 2000; of this 1.5 billion short tons was in the United States. Automobiles meet emission standards that required reductions of up to 98+ percent for HC, 96 percent for CO, and 95 percent for NOx compared to the uncontrolled levels of automobiles sold in the 1960s. Despite the fact that fuel use increased approximately 50 percent and vehicle miles traveled nationwide increased by 150 percent between 1970 and 1998, CO, VOC, and NOx emissions from motor vehicles in 1998 decreased by over 44 million short tons compared to 1970 levels.[2]

NEW YORK (UPI) — Englehard Industries, Inc., and Minerals & Chemicals Philipp Corp. have agreed in principle to merge Philipp into Englehard. It is proposed to split Englehard stock two-for-one, then to exchange for each Philipp share 1.094 share of Englehard common plus 0.177 share of a New Englehard $4.25 annual dividend preferred convertible into New Englehard common at three for one.

Rosenthal Gets Engelhard Post

NEWARK — Milton F. Rosenthal has been elected chief executive officer of the Engelhard Minerals and Chemicals Corp. He succeeded Charles W. Engelhard, who died a month ago.

Rosenthal, 57, had been president of the corporation since 1964. Mr. Englehard's post as board chairman will be filled by Alfred G. Blake, 69, who has been with the company 21 years.

Englehard's widow will take his place on the board.

Rosenthal joined Englehard as president after serving with the Hugo Stinness Corp., a West German metals and minerals concern. He is a native of New York City.

Engelhard Produces Variety

By COLIN BLACK
Press Staff Writer

WOODBRIDGE TOWNSHIP — Engelhard Industries, a division of the 95-year-old Engelhard Minerals & Chemicals Corp., said to be the nation's largest refiner and fabricator of precious metals, moved its headquarters Friday from Murray Hill to here in a consolidation move.

The new building is situated at 70 Wood Ave. in the township's Iselin section,

Inside Industry

next to Engelhard's research and development center in Menlo Park, Edison Township. It is adjacent to Metro Park Station and the Garden State Parkway.

ENGELHARD Minerals & Chemicals Corp. is based in New York. Another division, the Minerals & Chemicals Division, is situated across Wood avenue south of the new building.

Engelhard Industries has production facilities in Carteret, Newark, East Newark and Union, as well as in other states and abroad.

It is leasing two floors in the new four-story building which contains 92,000 square feet.

The parent company also is scheduled to move its headquarters and Philipp Brothers Division in New York from 299 Park Ave. to the McGraw-Hill Building at 1221 Avenue of the Americas in Rockefeller Center on May 23.

ENGELHARD has leased four floors of the McGraw-Hill Building. The 155,000 square feet of space is nearly double that of its existing Park avenue quarters.

Its Philipp Brothers Division is said to be the world's leading independent marketer of industrial raw materials, including ores, metals, alloys, minerals, fuels and fertilizers.

The division contributed about $5.7 billion of the company's 1976 net sales and operating revenues of $6.5 billion, according to Milton F. Rosenthal, president and chief operating officer.

"In the 10 years since Philipp Brothers moved to its current address, its total revenues have multiplied sevenfold," Rosenthal said. "As can be expected, its personnel increased substantially in number to accommodate the growth in its business.

"THE management of Philipp Brothers is convinced that despite the known, difficult problems of New York and the decision of many others to move their offices elsewhere, the city remains the ideal international crossroads for its operations."

Molten silver is poured from a furnace into ingot molds at Engelhard's metals refinery in Newark.

Engelhard employs 10,000 around the world. Of this total, 6,000 work in the U.S., 1,660 in New Jersey and 500 in New York. It is one of the largest companies in New Jersey for sales and employment, and is listed as the 28th largest company in the U.S. by Forbes rating system.

For the first quarter of 1977, ended March 31, it reported revenues of $1.5 billion, against $1.3 billion for the same quarter last year. Net earnings for the quarter were $28,970,000, compared with $30,742,000 for the same 1976 period.

RESENTHAL said the net earnings and pre-tax earnings of $45,012,000 for the first quarter were the company's second highest results for a first quarter, trailing by 5.8 and 5.3 per cent, respectively, the record earnings of the first quarter of 1976.

MILTON F. ROSENTHAL

"The year 1976 was the most successful business year in the company's history," Rosenthal said. "Record highs were achieved in net earnings, earnings per share of common stock, stockholders' equity, working capital, net sales and operating revenues, total assets and cash dividends to stockholders.

RETURN on stockholders' equity, another important criterion of performance, averaged 22.7 per cent.

"It is noteworthy that these achievements occurred in an economic environment that was inhospitable to most global companies in the natural resource industries.

"After a favorable beginning, the economy of the United States bogged down in the latter part of the year, while that of the other industrialized nations performed in a lackluster fashion throughout 1976.

"There are many indications that the economy in this country is strengthening, however, while that of other countries still trails behind. If these domestic trends continue, similar developments abroad should follow soon."h

ENGELHARD produces about 40,000 products of which thousands use gold, silver and platinum group metals. It refines all the precious metals.

It sells them through a global network of more than 30 sales offices. Its chief areas of operations are in the U.S. and Western Europe, with added important activities in Canada, Japan and Australia.

Its products are used in nearly every home and business in the U.S.

For example, the silver used in most toasters' electrical contacts is produced by Engelhard, and also the gold used to decorate most fine china and dinnerware. Even slick magazines use a fine clay made by Engelhard to heighten the gloss of its paper.

AMONG the fields its serves are the chemical, automotive, ceramic, pollution control, mill product, dental, jewelry, electrical, electronis, refining, glass and plastics industries. Many of its products also are used in research and development work.

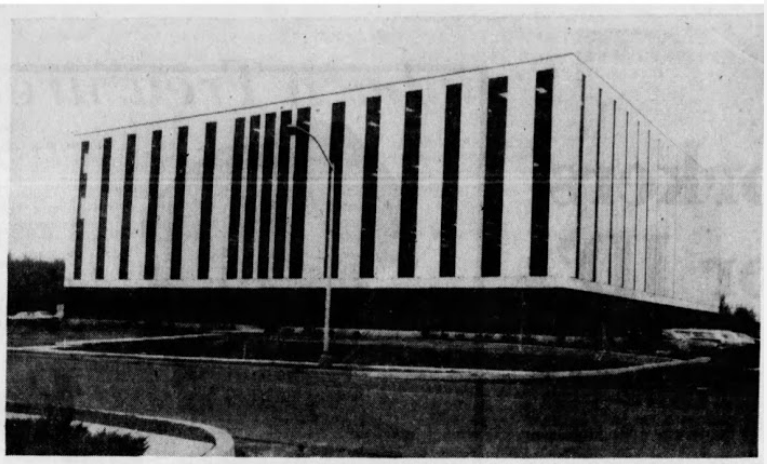
Engelhard even has a private *minting facility* in Carteret which produces commemorative coins, anniversary medallions and other special precious metal pieces for collectors, organizations and governments. Many of the Canadian olympic medals were made here.

The company was founded in Newark in 1875 by the late Charles W. Engelhard Sr., a German immigrant. In 1902, he purchased the Charles F. Croselmire Co. in Newark and with it founded the American Platinum Works the following year.

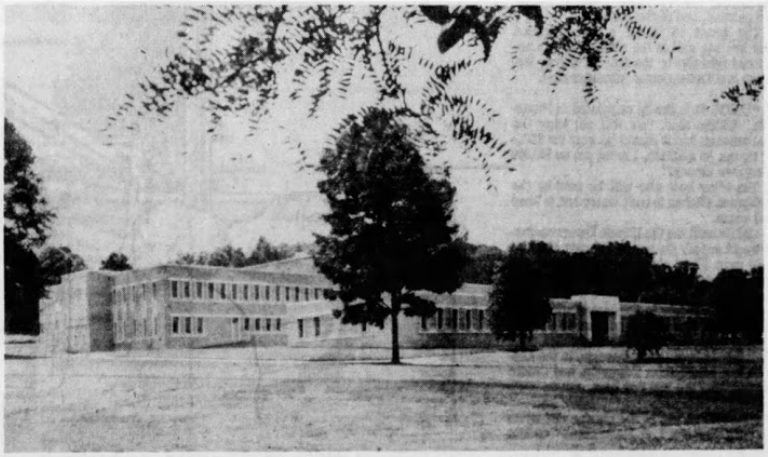
BAKER & Co., a Newark smelting and refining business, became a part of the company in 1904, and Hanovia Chemical and Manufacturing Co. a year later. This growth and diversification continued until the separate firms were consolidated in 1958 as Engelhard Industries Inc.

After other changes, the Engelhard organization merged with Minerals & Chemicals Philipp Corp. in 1967. The company's name was then changed to Engelhard Minerals & Chemicals Corp.

Engelhard's son, the late Charles W. Engelhard Jr., formerly chairman of the board of directors, died in 1971. The company currently doesn't have a board chairman.



Engelhard Industries has moved headquarters into this new building in Woodbridge.



Former headquarters of Engelhard Industries in Murray Hill will be sold.

Rosenthal retires

EDISON — Milton F. Rosenthal, non-executive chairman of Englehard Corp., told the company's board of directors that he intends to resign his post, but will run for re-election as a member of the board, the directors announced yesterday.

The board also announced that it intends to nominate Reuben F. Richards, 56, as non-executive chairman to succeed Rosenthal.

Engelhard manufactures specialty chemicals and metallurgical products. The company also deals in precious metals.

A History Of The International Chemical

The Alliance of Chemicals and Electronics

Chemical products used today in electronics seem, at first glance, to bea very ordinary kind. They are different from those generally offered, however, by reason of the extraordinary degree of purity which their producers must achieve in order to satisfy the stringent requirements of the electronics industry. The maximum dose of impurities tolerated in monocrystalline silicon amounts to one part in 10".

Polycrystalline silicon, produced from silane (SiH,) or trichlorosilane (SiHCl,) forms the upstream part of the *semiconductor sector*. Monocrystalline silicon is extracted from polycrystalline silicon and sliced into wafers 25microns thick and 8 to 10centimeters in diameter.

Hoechst's subsidiary Wacker is the world's leading polycrystalline silicon producer, with a capacity exceeding 2,000 tons. The overcapacities that began affecting the electronics industry in the early 19803 forced Monsanto, one of the largest wafer producers,to slow down its silicon production units in 1984. It has since sold this business to Germany's Hiils. Rhone-Poulenc, which had ambitions in the area but lacked the right technology, has withdrawn from the business.

There are enough suppliers of this type of silicon, including, for instance, Dow-Coming, Dynamit Nobel, Shin-Etsu, Tokuyama Soda, Motorola, and Texas Instruments.A possible substitute for the silicon used to produce wafers is *gallium arsenide*, in which Rhone-Poulenc, 101, and Shinetsu are already involved.

This situation shows how closely suppliers of electronic chemicals need to monitor the very rapid developments taking place in the area; otherwise, their productions r u n the risk of becoming obsolete before the full payoff.

Photosensitive products are also used for the production of wafers. These photoresists polymerize through X-ray treatment. They are called positive or negative according to whether or not they are soluble in solvents when exposed to light. The miniaturization of printed circuits tends to give a boost to positive resins. Germany's Hoechst has pioneered in such photosensitive resins. They are also supplied by Eastman Kodak, Olin Hunt, Ciba-Geigy, E. Merck and Tokyo Ohka Kogyo.

A great number of chemical firms have set up special divisions to manufacture products for the electronics industry, essentially through acquisitions. For example, *Du Pont* bought Berg Electronics in 1972, and a little later *Olin* purchased *Philip A. Hunt*. Some companies, such as Du Pont, Olin, and Ciba-Geigy, have chosen an "integrated systems" approach in this area by providing as wide a range as possible of products and services for the electronics industry. Others have elected to remain strictly within the special areas in which they excel through long experience or proper chemical integration. Thus it was the work carried out before the war with AEG that led BASFto make its range of magnetic tapes and gave it the supremacy in chromates which it shares with Du Pont. H oechst came to silicon through Wacker and to gases through Messer Griesheim, and now provides, besides high-purity special gases, a range of photosensitive polymers. RhonePoulenc became involved in printed circuits through its polyimide resins and Ciba-Geigy through its epoxy resins.

Most of the companies already producing diethylene glycol terephthalate polymers have launched into the applications of polyester film to video and data processing. Hoechst through its Kalle subsidiary, ICI. Rhone-Poulenc, Du Pont, Japan's Toray, Teijin, and Toyobo, the latter in association with Rhone-Poulencin Nippon Magphane.

Although Rhone-Poulenc has given up direct upstream development after fruitless association with Dysan in magnetic supports and Siltec in silicon, it still believes it can use its know-how in rare earthsto develop their electronics applications. Today, Rhone-Poulenc is the indisputable leader in rare earths, accounting for 40 percent of the world market. At its units in La Rochelle, France, and Freeport, Texas, it is capable of extracting from lanthanide sands the fourteen elements they contain. Over the last few years, samarium, for instance, has become essential for microelectronics to the same degree that europium and yttrium oxides already are for color television.

Whether they approach electronics directly, or through chemicals, or both, chemical companies involved in this business can hope to reap the fruits of their efforts in this area, providing, however, that the sector is spared the technological and economic jolts it has suffered over the past ten years.

Catalysts

Ever since England's Humphry Davy observed in the early 18005 that water was formed when hydrogen and oxygen react in the presence of a red-hot platinum wire, the phenomenon which Berzelius was to call catalysis has intrigued chemists. The uses of catalysts in industry were first consciously demonstrated by Peregrine Phillips in 1832 when he used platinum to oxidize sulfur dioxide (SO,) to form sulfur trioxide (SO,) and by Frederic Kuhlmannin

1837, when he produced nitric acid from ammonia.

Early in the twentieth century, Germany's Wilhelm Ostwald, France's Paul Sabatier, and America's Irving Langmuir had advanced a step in interpreting the phenomenon of catalysis by showing that it was characterized by an acceleration of the rate of reactions and that it was conditioned by the state of the catalyst's surface. From then on, chemical technology made striking progress through use of catalysts. Between 1905 and 1920, and more particularly in Germany, there was a spurt of new industrial-scale processes, for example, Fischer-Tropsch synthesis and BASF's use of vanadium oxide to produce sulfuric acid.

It is no exaggeration to say that without catalysts Germany would have been in noconditionto pursue its war effort until November 1918. Likewise, if Houdry had not developed in the early days of World War II its "catalytic cracking" process, the United States would have found it very hard to provide its bombers with light fuel. It was also through catalytic reforming that the United States managed to obtain from petroleum the toluene needed to produce TNT between 1941and 1945.

Since then, catalysts have played an essential role, particularly in the production of ethylene oxide from ethylene (Shell, Scientific Design), in the synthesis of hydrogen cyanide and acrylonitrile through ammoxidation (oxidation in the presence of ammonia), of formaldehyde (from oxidation of methanol), and, of course, in the polymerization reactions to produce plastics, elastomers, and synthetic fibers. It is not surprising, underthe circumstances, that a catalyst industry should have developed after World War 11through internal growth or through acquisitions. The very diversity of catalysts and of their uses has necessarily led to a fragmented sector.

Some oil companies became involved in the productionof catalysts because they needed them in their own refineries. Mobil has developed the ZSM 5 catalyst based on zeolite following studies which began as early as 1936 on catalytic cracking; Shell has used its own technology to develop the sales of its catalysts for hydrogenation cracking. Other companies became involved in catalysts because of their precious metals business.Johnson

Matthey, **Engelhard**, and Degussa applied their know-how in platinum metals to industrial catalysts. Chemical firms, for their part, approached the

area in different ways. I C Imade the most of its acquired know-how, particularlyin methanol and ammonia, by associating with Nalco to form Katalco, a catalyst supplier; American Cyanamid has set up asubsidiary in Holland with Ketjen; Rhone-Poulenc has formed Procatalyse in joint venture with Institut Francaisdu Petrole.

In other cases, the involvement in catalysts has been through acquisitions. **W. R. Grace** bought **Davison Chemical** in 1953. and in 1984 Union Carbide purchased Katalistics International, BV. One of the three leading United States companies in cracking catalysts, together with **Engelhard** and **Davison**, is **Harshaw-Filtrol**, which is the result of the merger of subsidiaries of Gulf Oil and Kaiser Aluminum & Chemical that have specialized in the area.

The developers of new processes have found it at times more expedient to set up their own separate entities to supply the catalysts they were advocating. Allied-Signal's subsidiary UOP did so for its platforming; Houdry for its catalytic cracking; Ralph Landau for the silver catalyst used for direct ethylene oxidation, which was marketed by Halcon SD and subsequently taken over by Denka, then by Bayer; and Phillips Chemical for its polyolefin catalysts, sold through its subsidiary, Catalyst Resources.

Through inert supports, a number of firms have succeeded in creating a niche in catalysts - for instance, Crosfield, a subsidiary of Unilever in England and a silica producer; or the German Siidchemie group, which specializes in hydrogenation and polymerizationcatalysts; or again Condea, which producesin West Germany alumina of high purity. The sector also includesa few firms which are only involved in a very special sector. Denmark's Haldor Topsoe makes catalysts for the synthesis of ammonia and methanol; and Lithium Company of America, an FMC subsidiary, produces lithium, while Du Pont makes boron derivatives. Linked to the oil industry, to petrochemicals, and to the large commodity chemicals, the catalyst industry can hardly escape the economic ups and downs affecting these three large sectors. Its clients are understandably both demanding and prudent, for the catalytic system is basic to the good running

of production units. This explains why it is an area of business that is so difficult to penetrate and run profitably. Its structure should therefore remain rather stable even with the development of catalytic exhaust systems. Introduction in the United States and in Europe of unleaded gasoline and the use of bimetallic systems for catalytic reforming should open up new markets for platinum and rhodium.

ROOTS

Immigrant Roots

The company's roots in the precious-metals industry extend back to 1891, the year in which Charles Engelhard immigrated to the United States from his native Germany to work as a foreign sales agent for his employer, a marketer of platinum. Engelhard decided to remain in the United States and soon was able to secure equity positions in a number of precious metals companies, chief among them Baker & Co., platinum; Irvington Smelting, which dealt with gold and silver; Hanovia Company; and American Platinum Works. Engelhard, who in*Forbes*, August 1, 1965, was described by his son as a "tough businessman" and "very Germanic," united the companies into a comprehensive precious-metals fabricator under the name of Engelhard Industries. The Engelhard interests bought, refined, and sold the full range of precious metals, but, with Baker & Co. taking the lead, soon developed a special expertise in platinum.

Platinum is valuable not only for its beauty but because it exhibits a number of unusual and useful physical properties, among them the virtually complete resistance to corrosionby chemicals or heat, and a molecularformation well-suited to various types of catalysis. By the early 1900s Engelhard had begun to exploit the metal's industrial value as well as its importance to the jewelry and dental trades, helping develop its use as a heat resistant liner for chemical vessels and as filaments in electric light bulbs. As platinum was scarce, however, the metals industry did not much pursue its industrial applications.

Engelhard Industries remained a supplier of precious metals primarily for ornamentation and dentistry. It was not until the 1920s that a secure supply of platinum encouraged further study of the metal's engineering value. A Canadian mining concern, Inco, formerly called International Nickel Company, demonstrated that platinum could be produced as a byproduct of nickel, thus temporarily stabilizing the supply of platinum and prompting intensive research into its properties. Charles Engelhard became Inco's exclusive dealer of platinum in the United States, and in the early 1930s created a research-and-development department of his own to pioneer new uses for the metal. In conjunction with Du Pont, Engelhard's Baker & Co. came up with a revolutionary process for the manufacture of nitric acid that employed a platinum and rhodium catalyst. The process was soon adopted throughout the chemicals industry. Engelhard Industries began a long evolution that would first transform the company into the world leader in precious-metals fabricating and later encourage its present focus on catalysis in many of its forms.

The 1930s saw the development of the platinum spinnerette, a platinum nozzle perforated by thousands of microscopic holes designed to spin out synthetic fibers for the manufacture of textiles. World War II fostered other uses of platinum, such as the platinum-tipped sparkplug for aircraft engines, able to withstand high temperatures for long periods without corroding. In the early 1950s platinum began to be used in the petroleum industry for the catalysis of high-octane gasoline and to refine heavy crude oils. Engelhard Industries continued to derive the large majority of its sales from nonindustrial markets such as jewelry, but in the 1940s Charles Engelhard added to his growing assortment of companies with the purchase of D.E. Makepeace Company of Massachusetts, makers of gold and silver sheet, tube, and wire; Amersil Company, industrial appliers of fused quartz; and National Electric Instruments Company, a manufacturer of medical instruments. With these and other industrial acquisitions, Engelhard laid the groundwork for the later expansion of his business carried out by his son, Charles Engelhard Jr. Born in 1917, Charles served as a pilot in World War II and afterward joined his father in the metals business. Anxious to make his own mark, young Engelhard soon moved to South Africa and began exploring opportunities in that mineral-rich country, source of much of the world's gold, platinum, and diamonds.

The South African Connection

Until 1971 the history of Engelhard Corporation was largely the story of Charles Engelhard Jr. The founder's son had the unusual good fortune to succeed in both of the roles available to a wealthy scion. He became an international socialite and built his father's company into a far greater success. Upon settling in South Africa, Engelhard started a gold-exporting business to supply his father's companies with raw material, as well as to turn a profit. At the time, gold could not be traded except in the form of art objects, so Engelhard shipped his gold in the shape of dishes, jewelry, and even solid gold pulpit tops, much of which was later melted down by the customer. Engelhard incorporated his firm, Precious Metals Development, in London in 1949, using the services of Robert Fleming & Co. At Fleming & Co. Engelhard met Ian Fleming, the creator of James Bond, who is believed to have used the portly, gold-toting Engelhard as the model for his famous villain, Auric Goldfinger. When his father died in 1950, the younger Engelhard assumed control of a complex, heterogenous mix of companies headquartered in Newark, New Jersey. He once again made the United States his home, bringing with him connections with many of the leading figures in South African mining.

Engelhard found that his autocratic father had run his various metals businesses virtually without administrative help, and set about centralizing authority while also delegating its daily implementation. In 1953 he brought in Gordon Richdale as president of Engelhard Industries, the main operating company for the family interests. Richdale had experience in mining in the Transvaal region of South Africa, and was a good friend of Sir Ernest Oppenheimer, the chairman of that country's dominant mining company, Anglo American Corporationof South Africa. Engelhard had become friends with Oppenheimer's son Harry as well, so when the Oppenheimers needed a partner for a 1957 bailout of Central Mining and Investment Corporation they turned to Engelhard. Central Mining was a large, London-based oil and mining company with extensive South African holdings, in danger of a hostile takeover, which it hoped to prevent with Engelhard's help. For a relatively small amount of cash, $3.5 million, Engelhard was able to gain a 30 percent share of Rand American Investments Limited, an Oppenheimer creation that then won the proxy fight at Central Mining and took control of its 12 gold mines, timber holdings, lime quarries, and 13 newspapers, with a total estimated value of $500 million. Charles Engelhard, Jr. was named chairman of Rand American, having parlayed a youthful lark in South Africa into an intimate partnership with one of the most powerful families in international business.

The South African venture was kept separate from Engelhard's stable of U.S. companies, which in 1957 had sales of $173 million, more than one-third of them derived from platinum fabricating. Engelhard Industries also did about $32 million in gold fabricating, and $55 million in silver, making it a world leader in all three of the major precious-metals markets. Industrial applications of precious metals were on the rise, and Engelhard Industries was well positioned to profit from their growing importance. Charles Engelhard, Jr. also continued to pursue his valuable South African connections. As part of the 1957 takeover of Central Mining, Engelhard and Harry Oppenheimer had agreed to a stock swap, each of them taking 10 percent of the other's family holding company. Engelhard thus gained a very valuable piece of Ernest Oppenheimer and Sons, the force behind Anglo American Corporation and the De Beers diamond mines, while Harry Oppenheimer took a similar chunk of Engelhard Hanovia, the family-owned corporation that, in turn, controlled 72 percent of Engelhard Industries. The trade would appear to have been one-sided, as Anglo American was a much larger concern than the Engelhard interests. Over the next two decades, however, Harry Oppenheimer continued to buy stock in Engelhard Hanovia and by 1970 came to own 70 percent, at which time his investment proved to have been very wise indeed.

In the meantime, Engelhard upped his investments in South Africa. In 1958 he set up the American-South African Investment Company Limited, with $34 million in assets. American-South African was an investment trust trading in South African gold stocks and was the first South African company listed on the New York Stock Exchange. As chairman of Rand Mines, one of the former Central Mining companies, Engelhard greatly expanded the firm's holding into uranium, coal, and copper refining; and in 1961 he paid $17 million for two gold mines owned by Kennecott Copper, rolling all of his South African holdings into a new joint investment company with the Oppenheimers called Rand Selection Corporation Limited. Engelhard had by that time become a figure of recognized importance in South African affairs, an honor that brings with it involvement in all of the moral and political difficulties besetting that country. After the Sharpeville massacre of 1960, Engelhard became more open in his criticisms of apartheid and somewhat curtailed his active investment in the country. Engelhard did not seem to bother himself with apologies or explanations of the relation between his fortune and apartheid. As a businessman and as a strong supporter and confidante of Democratic politicians, he appears to have viewed apartheid as inefficient and doomed but did not further concern himself with its injustices.

A Major Deal, 1963

In 1963 Engelhard put together the deal that would determine the future of his company. At the urging of Andre Meyer of the investment-banking house Lazard Freres, Engelhard took a 20 percent interest in Minerals & Chemicals Philipp (MCP), a recently formed partnership between a rather small producer of nonmetallic minerals such as kaolin and fuller's earth, and Philipp Brothers, a powerful trading firm specializing in the buying and selling of ores on the international market. Again Engelhard made a stock swap an important part of the deal, giving up 8 percent of Engelhard Hanovia as partial payment for his 20 percent interest in MCP, which in 1964 had sales of $447 million, the bulk of it generated by Philipp Brothers's fast-growing ore trading. In fact, Engelhard's purchase of MCP stock soon proved prescient, as worldwide demand for precious and industrial metals began to take off, and Philipp's sales

skyrocketed, gaining as much as 45 percent in a single year.

By 1966 MCP sales had reached $709 million, while Engelhard Industries did only about 40 percent of that figure. Engelhard nevertheless worked out a merger of the two companies, in September 1967, creating Engelhard Minerals & Chemicals Corporation (EMCC), with the Engelhard family controlling about 40 percent of the new giant's stock. Given the relative size of the partners in this transaction, and Harry Oppenheimer's increasing role in the Engelhard family interests, it is probable that the merger was made possible by the financial power of Oppenheimer's Anglo American Corporation. EMCC was already a large corporation, but its potential was not yet apparent to many observers. Nearly one-half of the company's 1967 net income of $28 million was generated by the Philipp trading division, with the Engelhard metal processing contributing 34 percent, and minerals and chemicals about 19 percent. Philipp's trading worked on a small profit margin but was soon to enjoy phenomenal growth, as the world turned increasingly to spot traders to move scarce natural resources around the globe quickly and efficiently. By 1972 EMCC's sales hit $2 billion, about 80 percent of it supplied by Philipp, and in 1974 revenue reached the astonishing figure of $5 billion and continued to climb.

Charles Engelhard, Jr. did not live to see the success of his combination, however. When the "platinum king," as he was called, died in early 1971, his family's Engelhard Hanovia owned 43 percent of the increasingly profitable EMCC; but by that time 70 percent of Hanovia was controlled by Anglo American, which promptly exchanged its Hanovia shares for 30 percent of EMCC, leaving the Engelhard family with 10 percent of EMCC and all of its other interests. The friendship of Engelhard and Oppenheimer thus ended with a rough parity of gain--with the help of Oppenheimer, Engelhard had built an enormous metals combination, but when the dust settled it was Oppenheimer who would reap the long-term benefits.

In the absence of an Engelhard heir interested in business, Milton Rosenthal was appointed chairman of EMCC. Rosenthal had been president of EMCC since the 1967 merger, and after Engelhard's death inaugurated a tightening of controls and general overhaul of the company. In part, this was an inevitable concomitant of the executive change, which saw Engelhard's largely blue-blood management give way to a team dominated by Philipp Brothers's trading veterans, chief among them Ludwig Jesselson. Neither side of the merger particularly enjoyed working with the other, and when the MCP men gained control of the company many of the Engelhard people left or were fired, and an air of hardworking sobriety settled over the firm. Rosenthal and his advisors cut back on luxuries but expanded mightily their trading business, which, soon after the 1973 oil crisis, began handling oil on the spot market. Commodities traded on the spot market, as opposed to the futures market, are for immediate delivery. From modest beginnings, the oil spot market quickly reached critical importance during the 1970s, a decade in which all natural resources seemed in short supply, and by 1978 Philipp was trading $4.5 billion in oil alone. Its $9 billion in total sales dwarfed the minerals-and-chemicals and precious-metals business of its partners, even as the latter became increasingly successful in the development of fluid catalytic cracking materials and exhaust emission control converters.

Philipp Brothers owed its success primarily to the scarcity of its commodities and the skill of its traders. By keeping tabs on the needs of both producers and consumers of over 100 kinds of raw materials, Philipp was able to buy and sell large quantities of goods for small but almost instant profits, and even offered its clients the use of a company bank in Switzerlandto help finance the construction of new plants or to make unusually large purchases. As the markets for raw materials became increasingly widespread, Philipp's business continued to grow at a fantastic rate, and from 1978 to 1980 EMCC's sales jumped from $10 billion to $26.5 billion, about 90 percent of which was due to Philipp. So great a disparity between former partners naturally strained corporate relations, as minerals-andchemicals people along with those in precious metals felt overshadowed by their trading counterparts and had trouble justifying time spent managing assets that grew at so comparatively slow a rate. In the spring of 1981, therefore, the metals-and-minerals and precious-metals divisions of EMCC were spun off as a new, publicly traded entity to be called Engelhard Corporation, while Philipp Brothers went its way as Phibro toward an eventual merger with Salomon Inc. Harry Oppenheimer's Anglo American Corporation maintained a 30 percent stake in both companies, a double wild card waiting to be played at any time.

Engelhard Starts Anew

The new Engelhard Corporation set about revising its mix of sales. In 1983, for example, when the company did about $2 billion in sales, 85 percent of the sales were generated by the precious-metals business, but the much smaller minerals and chemicals division produced 60 percent of Engelhard's net income. As a result, in that year the company began referring to itself as a specialty chemicals firm, and two years later regrouped its businesses according to function rather than the raw material involved. Thus, all catalytic businesses became part of the specialty-chemicals division, regardless of whether they made use of kaolin or platinum for their catalysis; while the specialty-metals division worked strictly with metals technology and metals management services. This gradual redefinition and housecleaning continued up to the 1990s, with Engelhard announcing that it would sell off some of its remaining gold and silver businesses and begin deep cuts in its salaried staff, in anticipation of which the company took a special charge of $160 million in 1989.

At the end of the 1980s Engelhard Corporation derived the lion's share of its sales from the remaining portion of its precious-metals fabrication business, $1.6 billion, but far more profitable was the catalysts-and-chemicals division, which earned $43 million on sales of $450 million in 1989. Much of that was generated by fluid catalytic cracking materials made for the petroleum industry. Even more promising was the performance of the company's third product grouping, now known as pigments and additives. This group, a descendent of the EMCC merger partner that produces paper coatings and pigments for the plastic and paint industries, along with several businesses purchased in 1988 from the Harshaw/Filtrol Partnership, netted $53 million on only $360 million in sales. It was no surprise, therefore, that despite its heritage as one of the world's premier users of precious metals, Engelhard was steadily moving toward the more lucrative fields of catalysis and specialty chemicals.

Ups and Downs During the 90s

Throughout the 1990s, Engelhard tried to grow through acquisitions and the introduction of new products. Revenues hit a high in 1990 of $2.93 billion, but would not reach that level again until 1996. Under CEO Orin Smith in 1992 Engelhard acquired the remaining 50 percent of its German auto catalyst subsidiary, Kali-Chemie; formed Salem Engelhard in a joint partnership with Salem Industries, a maker of pollution-control systems; formed Heraeus Engelhard Electrochemistry with Heraeus Inc.; and founded Acreon Catalysts with Procatalyse. In 1993 it sold off its interest in metal plating firm M&T Harshaw and in 1994 struck a deal with ICC Technologies, Inc. to develop and market air conditioning and air-treatment systems based on Engelhard's new desiccanttechnology, in which the use of ozone-depleting refrigerants could be avoided by drying the air before it is cooled. The same year, it also purchased the assets of Solvay Catalysts GmbH of Germany and of General Plasma, Advanced Plasma, and Jet-Com, manufacturers of thermal spray coatings for emissions-control applications which Engelhard intended to develop into a major line of emission systems technology products for cars, trucks, and buses. As part of a major reorganization plan, in 1994 Engelhard closed, relocated, or consolidated five of its U.S. facilities and two European sites.

In 1995 Engelhard formed a joint venture named Metreonwith W.R. Grace to develop advanced metallic-substrate catalytic converters for the auto industry, purchased the rest of its Salem Engelhard joint venture, expanded the production capacity of its Acreon venture, and formed a joint venture with CLAL, a French precious metal fabricator. It also expanded from its historical participation in the precious metals brokerage industry by entering base metals dealing and brokering through a new subsidiary, Engelhard International Ltd. and founded Engelhard Power Marketing to resell electric power to U.S.

utilities. In 1996, it formed Engelhard-Highland to produce high-performance color pigments in India, formed a joint venture with its Japanese affiliate N.E. Chemcat to manufacture auto catalysts in Thailand for sale throughout southeast Asia, and acquired the assets of infraredgas sensor manufacturer Telaire Systems, which it renamed Engelhard Sensor Technologies. In May 1996, it made its largest acquisition ever by acquiring Mearl Corporation, a maker of pearlescent pigments and iridescent film for the automotive and cosmetic industries.

Engelhard's major product launches in the 1990s included a "molecular sieve" water filter capable of significantly reducing contamination of household tap water, an auto emissions-control device that traps pollutinghydrocarbons during the two minutes after engine startup in which the catalytic converter is ineffective, a new trimetal catalyst technology named Trimax, a new catalyst for the heavy feedstocks demanded by Pacific Rim refineries, and an all-palladium auto catalyst that could be placed closer to the engine and activated more quickly. Perhaps its most promising innovation, however, was Prem-Air, a catalytic filter that when coated on a car's radiator promised to destroy 90 percent of the ozone passing over it. However, after testing the product on 20 of its cars Ford Motor decided that Prem-Air was not as effective as advertised and decided not to adopt it. Despite the blow, Engelhard continued to refine the product for other uses and positioned itself to become not only a supplier of auto emission catalysts but of "total solutions," including sensors, multicomponent packages, and catalyst substrates.

In 1996 Engelhard enjoyed its sixth consecutive year of record earnings and looked hopefully to emerging catalytics and pigments demand in Eastern Europe and the Pacific Rim. By the mid-1990s 41 percent of Engelhard's sales were outside the United States and its engineered materialsand commodities dealing operation was accounting for 60 percent of its revenues. The manufacture of catalysts/chemicals and pigments/additives together accounted for the remainder.

EpiGenX

As hot as today's news is this company that could make the success of Viagra a whimper in the dog-eat-dog world of business.

This integrated firm deals in the world of epigenetics, not a word that trips off the tongue lightly but one that may become a household word with the announcement earlier in the week that an entire human genome has been mapped.

David L. Gluck, Ph.D., president of EpiGenX, describes in glowing terms how this pharmaceutical player hopes to "fight disease through the control of genes."

Robert Acosta

The partnership of financial and chemical experts has a two-pronged approach: Sell the technology enhancing gene discovery to life science companies, then use the revenues to advance small molecule drugs to fight cancer and infectious disease.

Dennis Cagan

Diseased cells, like healthy cells, have a certain gene pattern, Gluck explains. In diseased cells, certain parts of the cell are turned off. Researchers hope to develop drugs to reprogram cell components, reversing the course of the disease, he says.

Josh Albright

This isn't science fiction. EpiGenX "has a lead anti-cancer drug to treat up to 65 percent of all cancers and has an active pipeline of second-generation drugs under development," the company's prospectus reports.

The National Cancer Institute is currently testing the lead drug in preclinical studies through the prestigious RAID program, the company adds.

Doug King

The company is also developing a class of antibiotics that would fight bacteria the same way as disease. Antibiotics based on gene mapping could render Staph, E. coli, salmonella and gingivitis infections harmless with virtually no side effects since the body's own mechanisms would be used, researchers believe.

Cheryl Auger

Gluck's request is for $4.5 million to equip a laboratory and carry out its objectives. The company has raised $300,000 from private investors with more than $800,000 additional pending along with $2.5 million in government grants.

Obviously, returns could be huge. Revenues from licenses and partnerships with pharmaceutical companies and "functional genomics" companies could bring in revenues of $100 million by Year 5, the company hopes.

EpiGenX plans to go after breast, colorectal and prostate cancers in its drug development. Medical care for these patients now totals more than $30 billion a year. A successful drug could help three million patients.

Company Information:

EpiGenesis Pharmaceuticals Inc., is located at Santa Barbara, CA and is a privately held biopharmaceutical company developing inhaled respiratory medicines for the treatment of asthma and chronic obstructive pulmonary disease (COPD).

Epigenesis is focused on inhaled delivery to leverage the enhanced safety profile of topical therapy over systemic therapy. The Company's lead compound, EPI-12323, is a once daily, small molecule, inhaled non-glucocorticoid steroid that targets the inflammatory and airway obstruction cascade in the irritated lung.

The Company is committed to developing a series of inhaled respiratory medicines through Phase II studies using small molecule discovery methods.

Epigenesis is continuing its product development efforts by observing a broader asthma population in a Phase II clinical study using its new proprietary inhaled dry powder formulation.

Posted on: 05/09/2001

Dr. Yuan-Tseh Lee Joins Fellow Scientists on Biotechnology Company Advisory Board

SANTA BARBARA, Calif.--(BW HealthWire)--May 7, 2001--EpiGenX Pharmaceuticals Inc., announced today that Dr. Yuan-Tseh Lee has joined a distinguished advisory board which has been assembled to guide the Company in the development of epigenetic-based diagnostics and therapies for cancer and infectious disease. The Scientific Advisory Board, composed of leading scientists in the biotechnology and academic community, will be instrumental in accelerating the development and commercialization of the company's technologies.

Dr. Yuan-Tseh Lee joins an elite group including Michael T. Bowers, Ph.D., Professor of Chemistry and Thomas C. Bruice, Ph.D., Professor of Chemistry and Biochemistry from University of California, Santa Barbara; Joseph F. Costello, Ph.D., on the faculty of University of California, San Francisco, Department of Neurological Surgery; Melvin Louis DePamphilis, Ph.D., Section Chief for the Eukaryotic DNA Replication and Gene Expression unit of the Molecular Growth Laboratory at the National Institute of Child Health and Human Development; as well as Jeffrey L. Ebersole, Ph.D., Professor of Oral Health Research and Director, Center for Oral Health Research, from University of Kentucky, College of Dentistry and Arthur D. Riggs, Ph.D., Associate Director of the Beckman Research Institute of the City of Hope National Medical Center.

EpiGenX's Scientific Advisory Board now features expertise covering cancer biology, infectious disease, bioorganic chemistry and mass spectrometry technologies. Epigenetic strategies entail developing the advanced understanding of gene regulation, and its manipulation in order to fight disease, particularly cancer and infections.

"We are extremely honored to have Dr. Lee join our advisory board," commented Larry Bymaster, President and Chief Executive Officer, EpiGenX. "He has unparalleled expertise in molecular beam technology and we are pleased that he has agreed to provide counsel to our team of scientists."

"Dr. Lee is universally recognized as a world leader in design and use of customized state-of-the-art instrumentation for chemical analysis," noted Alec Wodke, Director of Epigenomics, EpiGenX. "We look forward to his guidance in defining the technology directions for our High Throughput Epigenetic applications."

EpiGenX Scientific Advisory Board is now composed of:

- Michael T. Bowers, Ph.D., a Professor of Chemistry at UCSB, and one of the world's leading scientists in the field of mass spectrometry has served for over 10 years as, Editor, International Journal of Mass Spectrometry and Ion Processes and serves as Associate Editor Journal of the American Chemical Society. Dr. Bowers his Ph.D. in 1966 from the University of Illinois. His Awards include: Nobel Laureate Signature Award of the American Chemical Society (1988); American Chemical Society Award for Outstanding Achievement in Mass Spectrometry (1996); Guggenheim Fellowship (1994); and UCSB Faculty Research Lecturer (1994). He is a Fellow of the American Physical Society and of the American Association for the Advancement of Science.
- Thomas C. Bruice, Ph.D., a Professor of Chemistry and Biochemistry at UCSB, was listed among the world's 50 most cited chemists for the period from 1984 to 1991. He has been elected a Member of the National Academy of Sciences (1974), a Fellow of the American Academy of Arts and Sciences and a Fellow of the AAAS (1989) as well as the Royal Society of Chemistry. His awards include: NIH Career Development (1979); Lifetime Investigator and MERIT Awards; Guggenheim Fellow (1979); UCSB Faculty Research Award (1970); American Chemical Society Arthur C. Cope Scholar Award (1987), Richard C. Tolman Medal (1979), Repligan Medal in Biochemistry (1987), Alfred Bader Medal in Bioorganic and Bioinorganic Chemistry (1988), and the James Flack Norris Award (1996) in physical organic chemistry.
- Joseph F. Costello, Ph.D., serves on the faculty at University of California, San Francisco, Department of Neurological Surgery, and is a leading expert in the field of methylation, including identifying non-random and tumor-specific methylation patterns in human malignancies. His awards include the James S. McDonnell Foundation 21st Century Scientist Award. Dr Costello is a member of the Brain Tumor Research Center at UCSF and has had his work featured in editorials published in Nature Genetics, Science, The Scientist and Wired Magazine. He serves as an ad hoc reviewer for Nature Genetics, Proceedings of the National Academy of Science, Cancer Research, and Genes Chromosomes & Cancer.
- Melvin Louis DePamphilis, Ph.D., is the Section Chief for the Eukaryotic DNA Replication and Gene Expression unit of the Molecular Growth Laboratory at the National Institute of Child Health and Human Development, Bethesda, MD. He previously served as a Laboratory Head and Full Member of the Roche Institute of Molecular Biology, an Adjunct Professor in the Department of Biological Sciences at Columbia University, and a Professor in the Department of Biological Chemistry at Harvard Medical School. Dr. DePamphilis is one of the country's leading experts in the initiation of DNA replication in mammalian chromosomes; gene expression at the beginning of mammalian development. He currently serves on the editorial board of the following journals: Molecular Reproduction and Development, Molecular Biology Reports, Gene Therapy & Molecular Biology, Cell Structure and Function and Molecular and Cellular Biology.
- Jeffrey L. Ebersole, Ph.D., is Professor of Oral Health Research and Director, Center for Oral Health Research, at University of Kentucky, College of Dentistry. Earlier in his career, he was Professor of Periodontics and Microbiology at The University of Texas Health Center and, in the mid-1980's, Associate Clinical Professor of Oral Biology and Pathophysiology at the Harvard School of Dental Medicine. Dr. Ebersole's research area is B cell biology and antibodies in secretory immunity and periodontal immunobiology. He has had NIH funding for over 25 years. His primary research emphasis is in the development, specificity and functional abilities of antibodies in the oral cavity.
- Yuan-Tseh Lee, Ph.D., a Nobel laureate in chemistry in 1986, is the current President of Academia Sinica, the highest research institute in Taiwan. In 1986, Lee shared the Nobel Prize in Chemistry with Dudley R. Herschbach and John C. Polanyi for helping to apply the technology and theory of physics to chemistry. In his research, Lee extended Herschbach's "crossed molecular beam technique" to analyze larger and more complex molecules. Dr. Lee received his doctorate from the University of California at Berkeley in 1965. His world-leading laboratory now contains seven very sophisticated molecular beam apparati, which were specially designed to pursue problems, associated with reaction dynamics, photochemical processes, and molecular spectroscopy. His awards include: Alfred P. Sloan Fellow (1969 - 1971); Fellow, American Academy of Arts and Science (1975); Fellow, American Physical Society, (1976); John Simon Guggenheim Fellow (1976 - 1977); Member, National Academy of Sciences (1979); Member, Academia Sinica, Taiwan, China (1980); Ernest O. Lawrence Award, U.S. Department of Energy (1981); Peter Debye Award of Physical Chemistry, American Chemical Society (1986) and the National Medal of Science in 1986.
- Arthur D. Riggs, Ph.D., a noted molecular biologist, serves as the Chair, Division of Biology, and Associate Director of the Beckman Research Institute of the City of Hope National Medical Center, which has been designated a Comprehensive Cancer Center by NCI. Dr. Riggs' was one of the scientific founders of Genentech. He is a pioneer in developing an understanding of how methylation acts as an epigenetic control. Currently he is studying X chromosome inactivation and the biological roles of DNA methylation. Dr. Riggs' scientific achievements span three decades at City of Hope.

EpiGenX has accepted invitations to make presentations at two industry conferences this month. The company will be presenting at the Innovative Drug Development Conference in New York on May 8th and the C21 Biotech Convergence Conference in Monterey Bay, California on May 23rd.

EpiGenX Pharmaceuticals is pioneering the development of epigenetic-based diagnostics and therapies tailored to the needs of individual patients. Epigenetic strategies entail developing the advanced understanding of gene regulation, and its manipulation in order to fight disease, particularly cancer and infections. The company's technology platforms all involve DNA methylation. EpiGenX has three commercialization pathways. Its drug discovery tools, EpiHiTS(TM) Technology include a suite of high-throughput assays for the rapid discovery of new epigenetic-based drugs. The company is developing novel and safe therapeutics to fight cancer and infectious diseases through epigenetic mechanisms. EpiGenX is also developing a suite of high-throughput diagnostic and epigenomics technologies to generate information on the activity and inactivity of genes in relation to various diseases. EpiGenX Pharmaceuticals, Inc., is located in Santa Barbara, CA. For more information, call 805-964-4486 or log on to http://www.epigenx.com

EXHIBIT 10.2

SUBLEASE

THIS SUBLEASE (this "Sublease"), dated for reference purposes as of October 24, 2001, is made and entered into by and between EPIGENX PHARMACEUTICALS, INC., a California corporation ("EP"), and ARMED FORCES COMMUNICATIONS, INC., a CALIFORNIA CORPORATION, D/B/A MARKET PLACE MEDIA ("MPM") (the "SUBTENANT"), with reference to the following facts:

RECITALS:

A. EP is the Tenant under that certain Gross Rent Real Property Lease dated as of July 12, 2000 (the "ORIGINAL MASTER LEASE") between EP and Patterson Associates, LLC, a California limited liability company ("MASTER LANDLORD").

B. The Original Master Lease was amended by amendments dated December 18, 2000 and January 18, 2001 (the Original Master Lease, as so amended, is referred to in this Sublease as the "MASTER LEASE").

C. Under the Master Lease, EP leases certain premises located at 5385 Hollister Avenue in Goleta, California, as more particularly described in the Master Lease (the "PREMISES").

D. Subtenant desires to sublease a portion of the Premises from EP, and EP desires to sublease a portion of the Premises to Subtenant, on the terms and conditions set forth herein. All terms not otherwise defined herein shall have the meanings given such terms in the Master Lease.

AGREEMENTS:

NOW, THEREFORE, in light of the foregoing and in consideration of the mutual covenants set forth in this Sublease, EP and Subtenant, intending to be legally bound, agree as follows:

1. SUBLEASE OF PREMISES

1.1. SUBLEASE. Commencing on the date set forth in SECTION 2, EP subleases the Premises to Subtenant, and Subtenant subleases the Premises from EP. The parties estimate that the Premises consist of approximately 2,570 square feet. This statement of square footage is an approximation that EP and Subtenant agree is reasonable, and the Minimum Monthly Rent (defined below) is not subject to revision whether the actual square footage of the Premises is more or less.

1.2 TERMS. This Sublease is subject to all of the terms and conditions of the Master Lease. Except as provided in SECTION 1.3, Subtenant shall assume and perform all of EP's obligations under the Master Lease with respect to the Premises. Each of such terms and conditions of the Master Lease incorporated herein shall be terms and conditions of this Sublease. When the context requires, each reference in the Master Lease to Landlord shall be deemed to refer to EP, and each reference therein to Tenant shall be deemed to refer to Subtenant; PROVIDED, HOWEVER, that (a) EP shall not be obligated to perform any act of the Master Landlord under the Master Lease that EP does not have the authority or right to perform, and (b) any
provision of the Master Lease requiring the approval of the Master Landlord shall be deemed to require the approval of EP and the Master Landlord. As between EP and Subtenant, any inconsistency between the terms of the Master Lease and the terms of this Sublease shall be governed by the terms of this Sublease.

1.3 EXCEPTIONS. All of the terms and conditions contained in the Master Lease are incorporated herein as fully set forth, except for Sections N/A to the Master Lease.

2. TERM OF SUBLEASE

The term of this Sublease shall commence NOVEMBER 1. 2001 (the "COMMENCEMENT DATE"). Such term shall end at midnight, Pacific Standard Time, on AUGUST 31,2003.

3. CONDITION OF PREMISES

3.1 DUE DILIGENCE INVESTIGATION. As of the Commencement Date, Subtenant acknowledges that Subtenant will have conducted or will have had the opportunity to conduct a comprehensive investigation ("DUE DILIGENCE INVESTIGATION") of the Premises and all other matters that in Subtenant's judgment may affect the value or suitability of the Premises for Subtenant's purposes or that may influence Subtenant's willingness to enter this Sublease, including, without limitation, an inspection or examination of (a) the physical condition, size, and configuration of the Premises, including access, parking, location, or accessibility of utilities, the condition of the improvements, the existence of any hazardous materials, soil or topographical conditions, and earthquake preparedness; (b) the Master Lease; (c) title; (d) taxes; (e) income and expense data; (f) insurance costs; (g) permissible uses and zoning or development entitlements; (h) any applicable covenants, conditions, and restrictions; and (i) compliance with any federal, state, or local law, statute, rule, or regulation now or hereafter in effect (including without limitation the Americans With Disabilities Act of 1990, 42 U.S.C. ss.12101).

3.2 NO REPRESENTATIONS AND WARRANTIES. Subtenant acknowledges that EP would not sublease the Premises except on an "AS IS" basis, and agrees that (a) Subtenant accepts the Premises "AS IS" and with all faults; (b) neither EP nor any of its officers, agents, employees, or representatives has made any representations or warranties of any kind or nature, whether express or implied, with respect to the Premises or any of the matters relating thereto; (c) EP has no duty to make any disclosures concerning the condition of the Premises and/or the fitness of the Premises for Subtenant's intended use, and Subtenant expressly waives any duty that EP might have to make any such disclosures; (d) Subtenant is relying solely on Subtenant's own Due Diligence Investigation; (e) neither EP nor Master Landlord shall be required to perform any work of construction, alteration, repair, or maintenance of or to the Premises.

4. USE

Subtenant may use the Premises for office use and storage and for no other purposes whatsoever without the prior written consent of EP and Master Landlord.

5. RENT: SECURITY DEPOSIT

<PAGE>

5.1 MINIMUM MONTHLY RENT. During each month of the term of this Sublease, inimum monthly rent (as defined below) shall be payable in advance on or before the first day of each month, commencing on the Commencement Date (the "RENT COMMENCEMENT DATE"). The minimum monthly rent shall be TWO THOUSAND FOUR HUNDRED FORTY ONE AND ONE HALF Dollars ($2,441.50) per month (the "MINIMUM MONTHLY RENT"). Until modified by SECTION 5.2, Minimum Monthly Rent shall be payable in equal monthly installments in the amount set forth above.

5.2 ANNUAL ADJUSTMENT TO RENT. Minimum Monthly Rent shall be adjusted at the times and in the manner set forth in the Master Lease.

5.3 ADDITIONAL RENT. In addition to the Minimum Monthly Rent payable pursuant to SECTIONS 5.1 and 5.2, Subtenant shall pay to EP all other amounts required to be paid by EP to Master Landlord or any other third party under the terms of the Master Lease (the Minimum Monthly Rent and all other amounts required to be paid by Subtenant are referred to collectively as "RENT").

5.4 PAYMENT. All Rent payable by Subtenant hereunder shall be paid by Subtenant to EP not later than the close of business on the date first due, without prior notice or demand, without offset or reduction. All Rent shall be payable in lawful money of the United States at such place as EP may designate to Subtenant from time to time in writing. Rent or increased Rent for any partial month shall be prorated on the basis of a thirty-day month.

5.5 PREPAID RENT. Concurrently with the execution of this Sublease, Subtenant shall pay to EP the sum of TWO THOUSAND FOUR HUNDRED FORTY ONE AND ONE HALF Dollars ($2,441.50), representing the first month's Minimum Monthly Rent.

5.6 SECURITY DEPOSIT. The amount of the Security Deposit shall be TWO THOUSAND FOUR HUNDRED FORTY ONE AND ONE HALF Dollars ($2,441.50), which shall be paid concurrently with the execution of this Sublease.

6. INSURANCE

Subtenant shall procure and maintain policies of insurance insuring the Premises and Subtenant's use of the same with the coverages and amounts equal to or greater (at Subtenant's election) than those that EP is obligated to procure under the terms of the Master Lease. Such policies shall further comply with all of the terms of the Master Lease. Not later than thirty days prior to the expiration of any such policy, Subtenant shall present to EP evidence of the renewal of such policies, or the purchase of acceptable replacement policies, for the ensuing period. All such policies shall name both EP and Master Landlord as additional insureds and shall provide that they will not be subject to cancellation without thirty days' prior written notice to EP.

7. INDEMNIFICATION

Subtenant shall indemnify, defend with counsel acceptable to EP, and hold EP harmless from any claims, damages, costs, expenses, and/or causes of action that may arise or be in any way related to Subtenant's use and occupancy of the Premises.

8. DEFAULT: TERMINATION BY SUBTENANT

8.1 EVENTS OF DEFAULT. The following events shall constitute an event of default under this Sublease:

8.1.1 RENT. Subtenant's failure to make timely payments in accordance with SECTION 5;

8.1.2 BREACH. Subtenant's failure to honor or perform any other covenant, condition, or obligation imposed upon Subtenant by this Sublease; or

8.1.3 LEASE. Subtenant's failure to honor or perform any covenant, condition, or obligation imposed upon EP, as Tenant, under the terms of the Master Lease.

8.2 NOTICE AND CURE. EP shall provide Subtenant written notice of any default under this Sublease. If the default is attributable to Subtenant's failure to pay any sums hereunder, or owing under the Master Lease, Subtenant shall be entitled to cure any such default within three days following the due date thereof. If the default is attributable to any other acts or omissions of Subtenant, Subtenant shall be entitled to cure any such default within ten days of receiving written notice of any such default from EP.

8.3 REMEDIES. If Subtenant fails to cure any default within the applicable cure period specified in SECTION 8.2, EP may terminate this Sublease upon delivery of written notice to Subtenant. Upon any such occurrence, in addition to other remedies available to EP under law, EP immediately shall be entitled to (a) terminate Subtenant's right to possession of the Premises and evict Subtenant therefrom through legal process, and (b) to exercise, as to Subtenant, all of the rights and remedies available to Master Landlord under the Master Lease, as if all such rights and remedies were set forth verbatim herein.

9. GENERAL PROVISIONS

9.1 ATTORNEYS' FEES. If either party engages counsel to enforce that

party's rights hereunder or to resolve any dispute arising out of or related to this Sublease, whether or not litigation is commenced, the prevailing party shall be entitled to recover from the nonprevailing party all reasonable costs and expenses (including, without limitation, reasonable attorneys' fees, court costs, and expert witness fees) incurred by the prevailing party.

9.2 INTEGRATION. This Sublease contains all of the agreements of the parties with respect to the matters contained herein. No prior or contemporaneous agreement or understanding, oral or written, pertaining to any such matters shall be effective for any purpose.

9.3 VENUE. If any action or other legal proceeding is filed in connection with this Sublease, venue for the same shall be had in Santa Barbara County, California.

9.4 COUNTERPARTS. This Sublease may be executed in any number of counterparts, each of which shall be an original, but all of which shall constitute one and the same instrument.

(Signatures appear on the following page.)

Nastech Pharmaceutical Company to Cut 50 Jobs

BOTHELL, Wash., Feb. 12 -- Nastech Pharmaceutical Company Inc. (Nasdaq: NSTK - News) announced today that its Board of Directors has approved a plan to further reduce operating expenses and align the company's workforce with its strategic, business and clinical development requirements.

"The workforce reduction of approximately 50 employees will enable us to drive our key clinical development and RNAi programs forward in a more efficient manner for the benefit of our shareholders," stated Steven C. Quay, M.D., Ph.D., Chairman and CEO of Nastech. "The savings by this action are estimated to be not less than $11 million during the 2008 fiscal year."

About Nastech

Nastech is a clinical stage biopharmaceutical company focusing on the development and commercialization of innovative therapeutic products based on its proprietary molecular biology-based drug delivery technologies and, through its wholly-owned subsidiary, MDRNA, Inc., based on its proprietary ribonucleic acid interference technology. Nastech and its collaboration partners are developing products for multiple therapeutic areas including osteoporosis, obesity, diabetes, autism, respiratory diseases and inflammatory conditions. Additional information about Nastech is available at http://www.nastech.com.

https://www.biospace.com/article/releases/marina-biotech-inc-formerly-known-as-mdrna-inc-announces-closure-of-cambridge-site-and-consolidation-of-r-and-d-operations-in-bothell-wa-/

Marina Biotech, Inc. (Formerly Known as MDRNA, Inc.) Announces Closure of Cambridge Site and Consolidation of R&D Operations in Bothell, WA

Published: Feb 14, 2012

BOTHELL, WA--(Marketwire - February 14, 2012) - Marina Biotech, Inc. (OTCQX: MRNA), a leading nucleic acid-based drug discovery and development company, today announced the closure of its Cambridge site and the consolidation of all research and development efforts at its headquarters in Bothell, WA. In addition, the Company announced dosing of the first patient in Cohort 2 in the Dose Escalation Phase of the START-FAP (Safety and Tolerability of An RNAi Therapeutic in Familial Adenomatous Polyposis) clinical trial with CEQ508.

"After considerable review, we have decided to close our Cambridge site and transfer those research and development efforts to our headquarters in Bothell, WA," said J. Michael French, President & CEO of Marina Biotech. "This move will not affect the START-FAP trial as noted by our announcement today of Cohort 2 dosing. Further, we expect to continue to develop the tkRNAi platform in our labs in Bothell. The closing of the Cambridge site is consistent with our continued efforts to reduce our cash utilization. The individuals affected by this decision were all part of the former Cequent team who then, and

certainly over the past several years, were instrumental to the development of CEQ508 and the successful execution of the START-FAP trial. I want to thank them for their efforts and wish them all well in their future endeavors."

EXECUTIVE MANAGEMENT TEAM

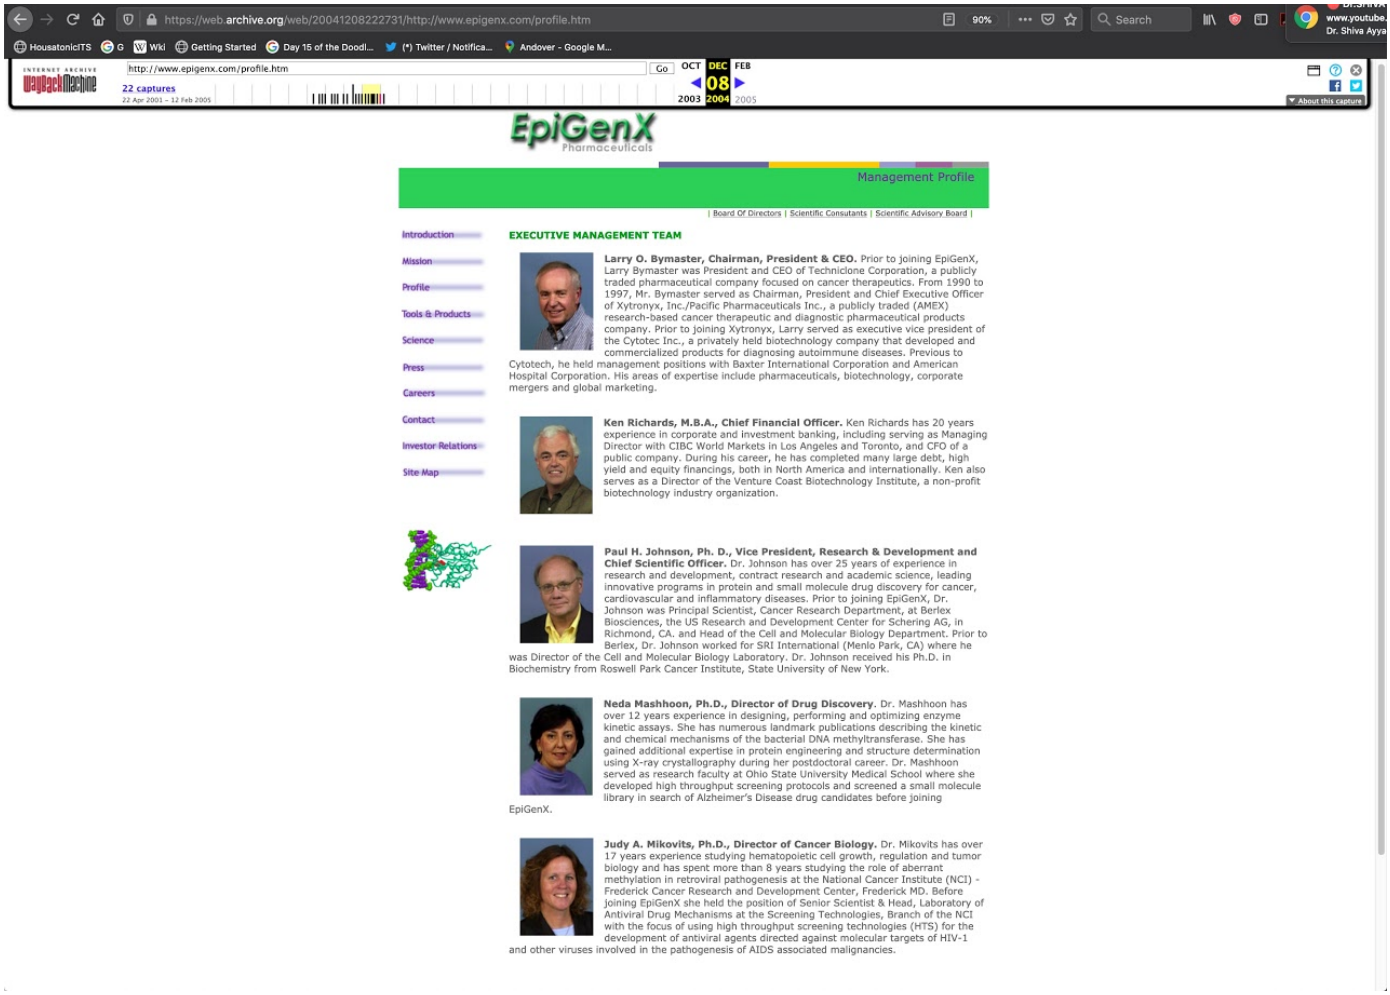
Larry O. Bymaster, Chairman, President & CEO. Prior to joining EpiGenX, Larry Bymaster was President and CEO of Techniclone Corporation, a publicly traded pharmaceutical company focused on cancer therapeutics. From 1990 to 1997, Mr. Bymaster served as Chairman, President and Chief Executive Officer of Xytronyx, Inc./Pacific Pharmaceuticals Inc., a publicly traded (AMEX) research-based cancer therapeutic and diagnostic pharmaceutical products company. Prior to joining Xytronyx, Larry served as executive vice president of the Cytotec Inc., a privately held biotechnology company that developed and commercialized products for diagnosing autoimmune diseases. Previous to Cytotech, he held management positions with Baxter International Corporation and American Hospital Corporation. His areas of expertise include pharmaceuticals, biotechnology, corporate mergers and global marketing.

Ken Richards, M.B.A., Chief Financial Officer. Ken Richards has 20 years experience in corporate and investment banking, including serving as Managing Director with CIBC World Markets in Los Angeles and Toronto, and CFO of a public company. During his career, he has completed many large debt, high yield and equity financings, both in North America and internationally. Ken also serves as a Director of the Venture Coast Biotechnology Institute, a non-profit biotechnology industry organization.

Paul H. Johnson, Ph. D., Vice President, Research & Development and Chief Scientific Officer. Dr. Johnson has over 25 years of experience in research and development, contract research and academic science, leading innovative programs in protein and small molecule drug discovery for cancer, cardiovascular and inflammatory diseases. Prior to joining EpiGenX, Dr. Johnson was Principal Scientist, Cancer Research Department, at Berlex Biosciences, the US Research and Development Center for Schering AG, in Richmond, CA. and Head of the Cell and Molecular Biology Department. Prior to Berlex, Dr. Johnson worked for SRI International (Menlo Park, CA) where he was Director of the Cell and Molecular Biology Laboratory. Dr. Johnson received his Ph.D. in Biochemistry from Roswell Park Cancer Institute, State University of New York.

Neda Mashhoon, Ph.D., Director of Drug Discovery. Dr. Mashhoon has over 12 years experience in designing, performing and optimizing enzyme kinetic assays. She has numerous landmark publications describing the kinetic and chemical mechanisms of the bacterial DNA methyltransferase. She has gained additional expertise in protein engineering and structure determination using X-ray crystallography during her postdoctoral career. Dr. Mashhoon served as research faculty at Ohio State University Medical School where she developed high throughput screening protocols and screened a small molecule library in search of Alzheimer's Disease drug candidates before joining EpiGenX.

Judy A. Mikovits, Ph.D., Director of Cancer Biology. Dr. Mikovits has over 17 years experience studying hematopoietic cell growth, regulation and tumor biology and has spent more than 8 years studying the role of aberrant methylation in retroviral pathogenesis at the National Cancer Institute (NCI) - Frederick Cancer Research and Development Center, Frederick MD. Before joining EpiGenX she held the position of Senior Scientist & Head, Laboratory of Antiviral Drug Mechanisms at the Screening Technologies, Branch of the NCI with the focus of using high throughput screening technologies (HTS) for the development of antiviral agents directed against molecular targets of HIV-1 and other viruses involved in the pathogenesis of AIDS associated malignancies.



Chatper 1 :

She regaled the patrons with stories about her more than twenty years working at the National Cancer Institute in Maryland. Or, if they were in the mood for romance, she told them about meeting David at a conference in Ventura in 1999, getting married at the age of forty-two, commuting for a few months between the NCI on the East Coast and David's home in Ventura, and finally deciding that if she wanted a real marriage she needed to be in the same time zone as her husband.

It was his gentle magnetism that brought her there, to a place where an accomplished scientist might be found tending bar at an egalitarian yacht club.

To be nearer to David, she got a job as director of cancer research with a biotech start-up in Santa Barbara called EpiGenX Pharmaceuticals, which was developing drugs to regulate tumor suppressor genes, leading to more effective outcomes for cancer treatment. The drugs they were developing decreased DNA methylation (increased DNA methylation caused silencing of gene expression), which normally becomes disrupted as cancer spread through the body, thus causing further downstream damage. The intellectual property for the company was licensed out of the University of California at Santa Barbara (UCSB) and Judy was intimately involved in the construction of the lab EpiGenX built, as well as securing two SBIR grants from the NIH.

The company had floundered in the wake of the sluggish economic climate after 9/11. In the spring of 2005, it was in the process of being bought out by a larger company. EpiGenX had generated a fair amount of its own intellectual property, but with no funding to pay employees, Mikovits was the only actual lab employee left. She would still go into the lab every day and run experiments, but the company had also put her in charge of handling due diligence for the upcoming sale, which took a few hours every day. Mikovits knew that when the sale went through she would in all likelihood need to look for a new job.

The sale wouldn't take place for several months, so on one Friday evening in late 2005, Judy found herself working behind the bar when then vice-commodore of PBYC, Joe Vetrano, walked in with his new girlfriend, Karen, an accountant. It would prove to be a moment of serendipity, with Judy's candor working in her favor. The three of them a human herpes virus HHV-6. Judy was intrigued as Karen conveyed the substantial level of impairment and suffering of her boss's child. Karen's boss, Kristin Loomis, had started an organization to go after the virus, called the HHV-6 Foundation. After Karen had talked for several minutes and Judy excitedly asked a few questions, Joe initiated, off-handedly, "Judy, maybe you could help them."

"Yes, Joe, why not—I'll check it out," she replied with a grin, taking away their finished drinks.

* * *

Ken Richards joined EpiGenX in September of 2000, as chief financial officer, and recalled recruiting Mikovits from the NCI in May of 2001. 34 Ken was originally from Canada, having worked for seventeen years for a Canadian corporate investment bank before transferring with them to Los Angeles in 1997. He was surprised as a savvy money-man to find that the University of California at Santa Barbara (UCSB) had a phenomenal science and engineering program, but no systematic way to bring their research discoveries to market. Richards and two other ambitious partners founded the Santa Barbara chapter of Tech Coast Angels, the largest angel funding network in the United States.

It was at a meeting for Tech Coast Angels that Ken was introduced to EpiGenX, and through that company he would meet Mikovits. He later gushed about her: "Judy was a very well-spoken, knowledgeable, and dedicated scientist who wanted to do everything possible to find effective treatments for cancer," said Richards. On the question of why Mikovits seemed to have both strong supporters and critics, Richards said, "I tell everybody, Judy is very controversial. Many people do not like her and many people admire her. I am in the later category. She speaks her mind. When she develops a view, she is dedicated to that view and will defend it fiercely. She's combative in a positive sense, and that tends to irritate some people."

Richards believed that many of Mikovits's detractors had fallen victim to an unconscious form of sexism in which an assertive woman was "viewed as a bitch" while a man making a similarly impassioned defense of his position would be "admired and respected for his firm stance." 35 It seemed like the kind of post-feminist statement that perhaps only a man could make and be fully heard, especially regarding a disease like ME/CFS that was incorectly thought to only affect women and had been derogatorily referred to as "Yuppie flu" in its early years, with mocking press implying that women contracting the disease were overly driven.

Even though Mikovits would eventually leave EpiGenX, her tie with Richards would remain solid and he would remain a steadfast supporter. In 2011, Richards was putting together a private equity firm to invest in early stage technology and biotechnology companies. "[We] needed somebody with a strong science background, the first person I thought of was Judy Mikovits."

When a few higher-ups asked questions about bringing on this controversial figure, Richards had several cards to play on Judy's behalf. In addition to a recommendation from the respected Frank Ruscetti, Nobel Prize winner Luc Montagnier was very supportive of Judy and wrote highly of her work and her integrity when he penned a recommendation to the Yorkbridge management.

Seligson-Epstein engagement announced

Dr. and Mrs. David Seligson, Woodbridge, Conn., announce the engagement of their daughter, Ruth Louise, to David F. Epstein, son of Mr. and Mrs. Saul Epstein, 2325 Kendall Ave.

An August wedding is planned by the couple.

Miss Seligson will enter Harvard Law School in September. Both she and her fiance are graduates of Cornell University. Mr. Epstein is presently a graduate student in the department of government at Harvard.

Miss Seligson's father is professor and chairman of the department of Laboratory Medicine at Yale-New Haven Medical Center. Mr. Epstein's father is a professor of physics at the University of Wisconsin-Madison.

August Weddings

Seligson-Epstein

WOODBRIDGE, Conn. — Miss Ruth Louise Seligson and David Friedman Epstein were married Sunday in the chapel of Congregation B'nai Jacob here.

She will enter Harvard Law School in September, and he will continue his graduate studies in government at Harvard.

Their parents are Dr. and Mrs. David Seligson, Woodbridge, and Mr. and Mrs. Saul T. Epstein, 2325 Kendall Ave., Madison, Wis.

Dr. Seligson is chairman of the department of laboratory medicine at the Yale-New Haven Medical Center. Mr. Epstein is a professor of physics at the University of Wisconsin-Madison.

Origins and Early Development 67

pragmatic thinking."[111] Nevertheless, by affiliation or derivation, Strauss's ideas occupied a space in the education of many students and intellectuals who subsequently progressed to the highest levels of Washington's political elite.

Furthermore, the networks of political associations that emanate from the University of Chicago during the 1970s present a framework of interrelated biographies for many of those considered to be among the rank and file of today's neo-conservatives. Disciples of Strauss who have become associated with the more recent neo-conservative ascendancy are Lewis Libby, chief of staff and chief national security adviser to Vice President Cheney (who was introduced to the world of Strauss by his own Yale University professor and mentor, Wolfowitz); John Podhoretz, editorial page editor of the *New York Post*, former editor of the *Weekly Standard*, and son of first-generation neo-conservatives Norman Podhoretz and Midge Decter; Pentagon intelligence officer Abram Shulsky; Gary Schmitt, executive director of William Kristol's Project for the New American Century (PNAC); David Brooks, formerly of the *Weekly Standard* and now a columnist for the *New York Times*; Werner Dannhauser, a protégé of Strauss who left academia to take on editorship of *Commentary* after the retirement of Podhoretz; and Robert Kagan, also of the *Weekly Standard* and the son of leading Yale University Straussian Donald Kagan.[112]

For a number of reasons, this new generation of neo-conservatives reflected a break from the cultural milieu that started in Alcove 1. Generally speaking, the older neo-conservatives were not a force in the Republican Party. Although Irving Kristol and Gertrude Himmelfarb gave their backing to Nixon in 1972, many other neo-conservatives did not. It was a different story twenty years later, however, with William Kristol's assertion on behalf of most neo-conservatives that "any neo-con who drifts back to the Democratic Party is a pseudo-neo-con."[113] Even though the majority of older neo-conservatives twice voted for Reagan and a number worked for him, most had avoided becoming Republicans.[114] Furthermore, although the first generation neo-conservatives belonged to a highly influential academic elite, they remained in the academy all the same. Apart from one or two notable exceptions such as Wolfowitz, the next generation of neo-conservatives avoided academia and sought to hold positions in Republican administrations. As Irving Kristol observed in 1995, Strauss's original students had

[111] Wolfowitz interview, *Vanity Fair*.

68 America Alone

produced another generation of political theorists who chose to relocate in Washington.[115] Thus, the children of the original neo-conservatives left the academy in favor of politics.

Dozens of those who followed or were influenced by Strauss in the 1960s and 1970s joined the federal government to initiate a new conservative political outlook.[116] William Kristol clearly stated that he was unable to think of himself as being a scholar for the rest of his life.[117] He left Harvard following his doctorate to join William Bennett's staff at the Department of Education, later to become the chief policy adviser of Vice President Quayle. There is also a long list of other neo-conservatives who transferred from faculty to government office and brought Strauss's influence with them. Carnes Lord left the University of Virginia to serve on the National Security Council in the first Reagan administration. He also became chief foreign policy adviser of Vice President Quayle in the administration of George H. W. Bush. Nathan Tarcov left the University of Chicago to join the State Department Policy Planning Staff. David Epstein left Chicago's New School for Social Research and became an analyst in the Pentagon's Office of Net Assessment. Gary Schmitt left the University of Dallas to be part of Reagan's National Advisory Board for Foreign Intelligence. Abram Shulsky left Chicago to become director of Strategic Arms Control Policy at the Department of Defense. Michael Malbin left the University of Maryland to become the Associate Director of the House Republican Conference.[118]

NEO-CONSERVATIVES UNDER REAGAN

Looking at the biographies of many neo-conservatives, one could be forgiven for believing that the Reagan era was the time when neo-conservative ideas moved to the forefront of policy making. As Podhoretz himself remarked, by giving important positions to neo-conservatives such as Kirkpatrick, Eugene V. Rostow, Perle, and Abrams, Reagan seemed "to be forging a living link between the Democratic mainstream and his own administration."[119] Neo-conservatives also entertained high hopes for the youthful Director of the

Origins and Early Development 69

Office and Management and Budget David Stockman, who had studied at the Harvard Divinity School, where he was thought to have absorbed some neo-conservative thought, evidenced by his writings on welfare policy in the *Public Interest*. It is certainly true that Reagan's election as president in November 1980 looked like a major victory for American conservatism across the spectrum of policy issues. His resolve to diminish the extent of government intrusion into people's lives, cut taxes, reduce the regulation of savings and loans, lower the budgets for federal social programs, and remove the bureaucratic red tape of an overly centralized system of government convinced the true-blue guardians of conservatism that they finally had a man in the White House who shared their views. Podhoretz praised Reagan as a "political figure offering himself as the legitimate heir to Richard Nixon's usurped throne."[120] Reagan also looked like a victory for neo-conservative foreign policy. In contrast to the three presidents who had gone before him, Reagan seemed to share neo-conservative perceptions of the present danger and how to confront it.[121] The central tenet in his foreign policy was anti-Sovietism and the imperative of standing up to the Soviet threat in every part of the world. Podhoretz and others saw in Reagan "the hope that the Republican Party would now assume the responsibility for containing Soviet expansionism that had originally been shouldered by the United States under Democratic leadership but that the Democrats since Vietnam had been increasingly eager to evade."[122]

Because today's neo-conservatives believe the tenets advanced by Reagan's foreign policy validate their emphasis on preemptive war fighting, we discuss this claim (which we reject) in full detail in a later chapter. But in the 1980s foreign policy was not – yet – the neo-conservatives' exclusive realm. It makes sense therefore to look at how the neo-conservatives fared under the first Republican president with whom the neo-conservatives felt properly in tune. We look in particular at some of the tensions that arose with other elements of the conservative movement who also thought their time had come.

For an administration in which the neo-conservatives invested such high hopes and on which they now look back with awe, the Reagan period saw only moderate advances. True, they saw neo-conservatives such as

1983 - ONA analyst David Epstein completed a two-volume assessment of the US-Soviet investment balance

https://foreignpolicy.com/2015/01/06/the-battle-between-cia-and-the-pentagon-over-the-state-of-the-soviets-an-excerpt/

In 1983 ONA analyst David Epstein completed a two-volume assessment of the US-Soviet investment balance. Epstein's assessment built on the efforts of Major Lance Lord and retired Navy captain William Manthorpe who had inherited the military investment portfolio from Major Robert Gough in the late 1970s. The assessment broadly accepted CIA estimates of the direct costs of Soviet weapon systems that had been generated with the Agency's building-block approach. But Soviet production rates were hard to square with estimates of the USSR's military burden. In 1986 the CIA and the DIA estimated that over the years 1974–1985, the USSR had procured three times as many ICBMs and SLBMs as had the United States, nine times as many surface-to-air missiles, three times as many tanks, and ten times as many artillery pieces. Even though US systems were generally more costly than their Soviet counterparts, the USSR's dramatically higher production rates suggested that the burden imposed on the Soviet economy should be higher than the CIA's estimate of less than 14 percent, which had been revised upward from its earlier estimates of roughly 6–7 percent.

Acknowledgments

I am most grateful to Harvey C. Mansfield, Jr., and Nathan Tarcov, whose care and discernment in reading earlier versions of this book encouraged and enabled me to improve it. Judith Shklar and two anonymous referees for the University of Chicago Press also deserve thanks for a number of very helpful suggestions. The late Martin Diamond would have improved this book by his counsel; I wish to acknowledge my reliance on his writings and his example.

Comparisons and Implications of Alternative Views of the Soviet Economy

Mark M. Hopkins, Michael Kennedy

March 1984

Prepared for the
Director of Net Assessment
Office of the Secretary of Defense

Rand
SANTA MONICA, CA. 90406

APPROVED FOR PUBLIC RELEASE: DISTRIBUTION UNLIMITED

PREFACE

This report uses the Hopkins-Kennedy optimal control model of the Soviet Union to explore the implications of and make comparisons between three "worlds" (views) that hold differing assumptions concerning the nature of the Soviet economy. These are the "Birman world," the "CIA world," and the "Rosefielde-Lee world." A secondary objective is to investigate a large number of scenarios concerning foreign trade so as to improve understanding of this important aspect of the Soviet economy. This is the second in a series of reports that use the relatively new optimal control methodology. In both this report and its predecessor, estimates are made of the tradeoff curve between Soviet consumption and defense spending for the 1980s and of how this curve is affected by various parameters and uncertainties. The model is explained in detail in the first report by Mark Hopkins, Michael Kennedy, with the assistance of Marilee Lawrence, *The Trade-off Between Consumption and Military Expenditures for the Soviet Union During the 1980s*, The Rand Corporation, R-2927-NA, November 1982.

The project has been sponsored by the Director of Net Assessment, Office of the Secretary of Defense. This report should be of general use to analysts and decisionmakers concerned with the Soviet economy, and of particular use to those interested in predicting Soviet GNP, consumption, and defense expenditures, or in studying Soviet foreign trade issues of the 1980s. It will also be of interest to those concerned with the development and use of optimal control theory for the modeling of centrally planned economies.

SUMMARY

Igor Birman, the CIA, and, taken as a team, Steven Rosefielde and William Lee hold dramatically different views of the current and future state of the Soviet economy. If Birman is correct, the Soviet economy is in a severe crisis and faces a bleak future. If Rosefielde and Lee are correct, the Soviet economy is in excellent condition and has a bright future. The CIA takes an intermediate view. We define the Birman, CIA, and Rosefielde-Lee views and their implications for the future to be the Birman, CIA, and Rosefielde-Lee "worlds," respectively. The Soviet economy in the "Birman world" is smaller than it is in the "CIA world," and has a larger defense share and slower technological growth. The Soviet economy in the "Rosefielde-Lee world" is larger than it is in the "CIA world" and has a larger defense share and faster technological growth.

The primary objective of this report is to determine and compare the implications of the three worlds. A secondary objective (which is an add on to this phase of the project as originally conceived) is to develop and analyze a large number of foreign trade scenarios to improve our understanding of the role of foreign trade in the Soviet economy.

Our main approach is to employ the Hopkins-Kennedy optimal control model of the Soviet Union to calculate tradeoff curves between the average annual rate of growth of consumption and the average annual rate of growth of defense spending for the Soviet economy for the 1980s. Tradeoff curves for 71 scenarios are calculated and presented in various graphs.

When we explore a particular issue (e.g., the price of gold), our usual procedure is to define a high and low price scenario for the "CIA world" and then calculate and compare the corresponding pair of tradeoff curves. Next, we calculate the pairs of tradeoff curves for the same scenarios for both the Birman and the Rosefielde-Lee "worlds," and then compare all three pairs of tradeoff curves.

The West could increase the pressure on the Soviet economy by means of foreign-trade-related policies intended to produce some combination of the following effects: reducing the amount of credit extended to the Soviets by the West, increasing the amount of foreign aid that the Soviets give to their client states, "opening of the umbrella" by the Soviets (their taking some responsibility for the debts of client Eastern European nations), and reducing the efficiency superiority of Western capital exported to the Soviet Union as compared with Soviet-produced capital. Departures from the base case

ACKNOWLEDGMENTS

This project has benefited substantially from the insightful comments of a panel of senior Rand experts, which was formed to follow the progress of the project through a series of internal Rand briefings. The members of this panel are Arthur Alexander, Abraham Becker, Mike Landi, and Charles Wolf, Jr. Research assistance and assistance with computer graphics were provided by Marilee Lawrence and Mitchell Tuller, respectively. We would also like to thank C. Lance Barnett, Don Henry, and David Epstein for comments on earlier drafts that led to numerous improvements.

While the research reported here was being done, Michael Kennedy was senior research fellow at the Institute for Constructive Capitalism at the University of Texas at Austin. He is grateful to the institute and particularly to its director, Professor George Kozmetsky, for generous provision of research support.

1986 - 1988 : CILTS (Commission on Integrated Long-Term Strategy) : The CILTS Working Group on the Future Security Environment

PDF of book "SIX DECADES OF GUIDED MUNITIONS AND BATTLE NETWORKS: PROGRESS AND PROSPECTS" by Barry D. Watts : [HB004Z][GDrive]

lems are solved. Rather they merely reveal how much care is needed in discussing them.

Questions about Future War and an Anomaly

As mentioned at the end of Chapter I, the overall aim of this chapter has been to address the question: How ought one think about the emergence of guided weapons? By the mid-1980s both Soviet military theorists and Western observers were actively trying to think through how guided munitions and battle networks might eventually affect the conduct of war by military forces able to exploit them. This final section of Chapter II reviews the main questions about guided munitions raised in the late 1980s by Andrew Marshall and Charles Wolf during their deliberations on the future security environment as co-chairmen of a working group for the Commission on Integrated Long-Term Strategy (CILTS). Additionally, the discussion also highlights one anomaly regarding reconnaissance-strike systems that has become increasingly apparent during the last decade.

The Commission on Integrated Long-Term Strategy was begun in the fall of 1986 at the direction of President Ronald Reagan's defense secretary, Caspar Weinberger, and his assistant for national security affairs, John Poindexter. The commission's initial mandate was to propose "adjustments to U.S. military strategy in view of a changing security environment in the decades ahead."[152] Co-chaired by Fred C. Iklé (then undersecretary of defense for policy) and Albert Wohlstetter, CILTS had eleven other commissioners, including Zbigniew Brzezinski, Henry Kissinger, former NATO supreme commander General Andrew Goodpaster, Samuel Huntington and former JCS chairman General John Vessey.[153]

[152] Iklé and Wohlstetter, *Discriminate Deterrence: Report of the Commission on Integrated Long-Term Strategy*, p. i. By the time this report was published in January 1988, Frank Carlucci had replaced Weinberger as defense secretary and Colin Powell had become the assistant for national security affairs, having replaced Carlucci who had held the job from December 2, 1986, until November 23, 1987.

[153] The other CILTS members were Anne L. Armstrong, William P. Clark, W. Graham Claytor, Jr., Admiral (USN, retired) James L. Holloway III, Joshua Lederberg, and General (USAF, retired) Bernard A. Schriever.

[HB0050][GDrive]

The CILTS effort was supported by a number of working groups, whose studies were not published until after the commission's overall report, *Discriminate Deterrence*, appeared in January 1988.[154] *Discriminate Deterrence* did mention the possibility of an emerging RMA driven by the exploitation of microelectronics, information processing, and other technologies. In fact, it observed that the Soviet military was already "engaged in a major effort to understand the implications" of being able to employ precision munitions across wider geographical areas with greater rapidity and intensity than had been previously possible.[155]

However, detailed examination of these prospects and possibilities did not emerge until the report of Marshall and Wolf's CILTS working group on the future security environment was published in October 1988.[156] This group took seriously the possibility that Soviet military theorists might be right in anticipating that the conduct of war was entering a period of major or discontinuous change:

> The Working Group believes that the Soviets are correct in their assessment that the advent of new technologies will revolutionize war, and not merely make current forces marginally better at what they do. In the same way that long-range rifles and railroads transformed combat in the mid-19th century (and tanks and aircraft did in the mid-20th century), the new technologies will profoundly alter tactical requirements, operational possibilities, and even, in some cases, strategic choice in the early 21st century. New theaters of strategic concern—space, most notably—will open up, and previously discarded options (ballistic missile defense, for

[154] The topics assigned to the working groups were "the security environment for the next twenty years, the role of advanced technology in military systems, interactions between offensive and defensive systems on the periphery of the Soviet Union, and the U.S. posture in regional conflicts around the world" (Iklé and Wohlstetter, *Discriminate Deterrence*, p. i).

[155] Iklé and Wohlstetter, *Discriminate Deterrence*, p. 8.

[156] Members of the CILTS working group on the future security environment included Eliot A. Cohen, David F. Epstein, Fritz Ermarth, Lawrence Gershwin, James G. Roche, Thomas Rona, Stephen P. Rosen, Notra Trulock, III, and Dov Zakheim.

1999 - **Project for the New American Century (PNAC)**

http://zaprasza.net/a_y.php?article_id=17246

PNAC

The list of contributors to the PNAC document Rebuilding America's Defenses compiled in 2000, which called for a "new Pearl Harbor": Roger Barnett, U.S. Naval War College, Alvin Bernstein, National Defense University, Stephen Cambone, National Defense University, **Eliot Cohen, Nitze School of Advanced International Studies,** Johns Hopkins University, Devon Gaffney Cross, Donors' Forum for International Affairs, Thomas Donnelly, Project for the New American Century, **David Epstein, Office of Secretary of Defense, Net Assessment**, David Fautua, Lt. Col., U.S. Army, Dan Goure, Center for Strategic and International Studies, Donald Kagan, Yale University, Fred Kagan, U. S. Military Academy at West Point, Robert Kagan, Carnegie Endowment for International Peace, Robert Killebrew, Col., USA (Ret.), William Kristol, The Weekly Standard, Mark Lagon, Senate Foreign Relations Committee, James Lasswell, GAMA Corporation, I. Lewis Libby, Dechert Price & Rhoads, Robert Martinage, Center for Strategic and Budgetary, Assessment, Phil Meilinger, U.S. Naval War College, Mackubin Owens, U.S. Naval War College, **Steve Rosen, Harvard University**, Gary Schmitt, Project for the New American Century, Abram Shulsky, The RAND Corporation, Michael Vickers, Center for Strategic and Budgetary Assessment, Barry Watts, Northrop Grumman Corporation, Paul Wolfowitz, Nitze School of Advanced International Studies, Johns Hopkins University, and **Dov Zakheim, System Planning Corporation,** includes a relatively high proportion of Jewish names. There are many more individuals associated with PNAC.

https://en.wikipedia.org/wiki/Project_for_the_New_American_Century

The **Project for the New American Century** (**PNAC**) was a neoconservative[1][2][3] think tank based in Washington, D.C. that focused on United States foreign policy. It was established as a non-profit educational organization in 1997, and founded by William Kristol and Robert Kagan.[4][5] PNAC's stated goal was "to promote American global leadership."[6] The organization stated that "American leadership is good both for America and for the world," and sought to build support for "a Reaganite policy of military strength and moral clarity."[7]

Of the twenty-five people who signed PNAC's founding statement of principles, ten went on to serve in the administration of U.S. President George W. Bush, including Dick Cheney, Donald Rumsfeld, and Paul Wolfowitz.[8][9][10][11] Observers such as Irwin Stelzer and Dave Grondin have suggested that the PNAC played a key role in shaping the foreign policy of the Bush Administration, particularly in building support for the Iraq War.[12][13][14][15] Academics such as Inderjeet Parmar, Phillip Hammond, and Donald E. Abelson have said PNAC's influence on the George W. Bush administration has been exaggerated.[16][17][18]

The Project for the New American Century ceased to function in 2006;[19] it was replaced by a new think-tank named the Foreign Policy Initiative, co-founded by Kristol and Kagan in 2009. The Foreign Policy Initiative was dissolved in 2017.

2007 (April 27) - Libby letters

http://media.washingtonpost.com/wp-srv/politics/pdf/libbyletters-e-h.pdf

The Honorable Reggie B. Walton [...]:

I am writing to report information about the character of Mr. Scooter Libby that I believe is relevant to your consideration of an appropriate sentence. Much of my knowledge of Scooter was acquired when he was Deputy Undersecretary of Defense for Policy (1989-1993). **I have been a career civil servant in the Defense Department for 26 years, 20 of them as Deputy Director of Net Assessment, a small office that serves the Secretary of Defense as an internal think tank for long range strategic issues.** Scooter's years of devotion to public service speak for themselves. The quality and intensity of that service are what I observed and can testify to. At the Pentagon I had regular contact with Scooter due to our common focus on the Soviet Union, which was then in a period of enormous uncertainty and unpheaval. Scooter greatly impressed me by his determination to fully understand for himself, and convey to his superiors, the complexity and details of the issues. He did not stand on ceremony or rank. His focus was relentlessly substantive, and he pored over analytical reports in a way that I do not believe is common in busy, high level political appointees. He educated himself about technical military issues previously unfamiliar to him. He was forthright about what he knew, and eager to learn from the knowledge of others. I believe his performance exemplified the very highest standards of government service. Before and after his service in the Defense Department, Scooter was an attorney in private practice, and in both periods I know that he sacrificed many otherwise billable hours by serving the Department without pay. My office conducts an annual summer study, assembling several small groups of academics, military officers, and other experts to study issues of strategic importance. Scooter several times traveled to these events to work with the groups to sharpen their findings and their briefings for Defense Department officials. I encountered Scooter at several other activities where his participation was entirely pro bono. **He served in 1988 on a panel to plan a reorganization of the office of the Undersecretary of Defense for Policy, and in 1999 on a privately organized study group on the emergence of China**. I served on the latter panel as part of my job; for Scooter it was unpaid public service. **I first met Scooter years before his Pentagon service at a Sunday morning pickup softball game. The weekly softball game is not a bad laboratory in showing human virtues and vices, and Scooter was always a man of exemplary sportsmanship and honesty, a modest, sympathetic manner, and simple human kindness, manifested most memorably to me in his warmly welcoming my then-young son into an adult game.** Scooter's outstanding talents and high level of energy made it easy to see why his contributions to any enterprise would be so highly valued. That so many of these contributions were dedicated to the national security of our country is, to me, cause for gratitude and inspiration, and something I hope will be weighed properly in his favor.

2008

Mr. James Baker
Director
Office of Net Assessment
Department of Defense

Dear Mr. Baker:

I write today about your February 5, 2020, response to my January 22, 2020, letter regarding Stefan Halper's work for the Office of Net Assessment (ONA).[1] Since the beginning of my investigation, I have repeatedly requested all records related to Professor Halper's work for ONA, including travel records, pursuant to the contracts that he had with your office. However, despite these repeated requests, ONA has continually failed to furnish all requested records. It appears that either ONA has refused to comply with my requests, or that ONA simply does not maintain full records of Halper's work.

Moreover, your February 5, 2020, response appears to show that you have not performed the legally required annual "Net Assessments"—the purpose for which ONA exists. Further, your response failed to fully answer Questions 2, 3, 4(c), 4(d), 4(e), 6(a), 8, and 13 of my letter. Your response also couched unclassified work product relating to the costs to the taxpayer associated with your decisions to contract with entities for research work in a classified document. Accordingly, I formally request that you declassify, to the fullest extent possible under Executive Order 13526, the classified work product that you provided to me. Declassification is appropriate at this time because, among other factors, the taxpayers paid for those research projects and the public interest in knowing how much was spent, for what purpose it was spent, and the identity of the contract recipient far outweighs any perceived national security interest. In addition, some projects mentioned within the document have already been made public, classification cannot be used to prevent embarrassment to an agency, and classification cannot be used to hide government inefficiency from public and congressional review.

It is also perplexing that ONA continues to assert that Halper fulfilled the obligations set forth in his contracts. It has been reported by *The Washington Times* that many of the individuals in which Halper cited as sources in his research papers have outright denied having contributed to his work.[2] This begs the question as to how ONA can continue to assert that Halper's deliverables were of "high quality" and "conformed to the requirements set forth in the

[1] Letter from James Baker, Director, Office of Net Assessment, to Sen. Charles E. Grassley, Chairman, S. Comm. On Finance, dated February 5, 2020.

[HG008G][GDrive]

contract" when citations in his work appear to give contribution to individuals who had no involvement in the work. In your February 5, 2020, response to me, you noted that ONA checks the validity of citations and supporting documentation on each project. Clearly, that did not happen with Halper's work product.

On a related topic with your work at ONA, and related to my ongoing oversight work on the now-debunked Russian collusion narrative, according to an April 29, 2020, press release by *Judicial Watch* you exchanged many emails and phone calls with *The Washington Post* reporter, David Ignatius.[3] As you are aware, he first reported on the call between Lieutenant General Michael Flynn and the Russian Ambassador to the U.S., Sergey Kislyak, in *The Washington Post.*[4] Based on a court filing by Sidney Powell, one of Flynn's attorneys, it has been alleged that you were the source of the leak of the transcripts of Flynn's calls with Kislyak.[5]

Included in these 143 pages of email communications are several heavily redacted communications between you and Deputy Secretary of Defense Robert Work and Deputy Director of ONA, David Epstein, which would presumably be about Ignatius given the subject matter of the *Judicial Watch* Freedom of Information Act request.[6] Given the overlap in time between the majority of the emails and the leak of the call, your apparent close relationship with Mr. Ignatius, and your communications with Mr. Work and Mr. Epstein, please provide all 143 pages of email communications in unredacted form and all email communications among and between you, Mr. Work, Mr. Epstein, and Mr. Ignatius from July 1, 2016, to March 1, 2017, no later than July 2, 2020.

In furtherance of my continued oversight into ONA contract practices, and my investigation into mishandling of the Russia investigation, please answer the following no later than July 2, 2020:

1. In my February 5, 2020 letter, I asked that ONA provide the number of contracts awarded to the top five entities over the last five years. You provided this list in alphabetical order. I request that this list be provided in accordance to the dollar amount each entity has received over the last five (5) years. In your response, please provide the dollar figures for each entity for each year.

2. In response to question 4(b) of my letter, you responded that ONA reviews the validity of citations and supporting research "as a matter of course."[7] However, in your response to the DoD Inspector General you stated that ONA does not

[HG008H][GDrive]

agree that every contract requires exhaustive or significant verification of the methods used to derive analytic content.[8]

a. Were Halper's citations and supporting research checked for validity? If not, why not?

b. Are all deliverables reviewed to ensure the accuracy and validity of citations and supporting research? If not, why not?

3. In response to question 4(c), you state that "ONA does not require peer review as part of our acceptance process for commissioned work." Were Halper's contracts peer reviewed? If not, why not?

4. In the August 2019 article, published by *The Washington Times*, several sources that Halper claimed to have interviewed and consulted for his work have stated that they would not consider themselves to be contributors to his research papers, and some had no memory of being asked to participate in any project at all.[9]

a. Has ONA reached out to each individual listed in Halper's statement of work to verify that each individual was in fact interviewed or contributed to Halper's research? If not, how can you state with certainty that Halper fulfilled the terms of his contracts?

b. Can you state with certainty that Halper interviewed the individuals that he claimed to interview for his research papers? If not, how can you claim that Halper's work was of high quality?

5. In question 4(e), I asked if ONA currently requires contractors to provide the name and dollar amount contributed by third parties to ensure a contractor's work is in no way influenced by foreign individuals or entities. In response to this question, you spoke only of ONA's employees and conflict of interest forms that they are required to sign. This was not my question, and therefore your answer is unresponsive. In documents provided to my office Halper's travel to Japan is listed as being paid for by a third party. ONA does not appear to know the name or identity of the individual or entity that paid for Halper's travel to Japan.

a. Did ONA attempt to elicit an answer at any point from Halper as to who paid for this travel? If not, why not?

b. Does ONA believe that travel paid for by a third-party could, on its face, be a conflict of interest to a DoD-sponsored study? If not, why not?

6. In response to question five of my letter, you state that approval to exercise an option of a contract is given by an independently appointed contracting officer, who is not under your direction or authority. However, you also state that ONA

[8] Department of Defense Office of Net Assessment, Response to DoD IG Research Project on DoD Office of Net Assessment Contract Management (Project No. D2019-D000AX-0104.000), dated June 27, 2019.
[9] Rowan Scarborough, *Loose Contracting Practices at Pentagon Office Waste Millions; Whistleblower Punished*, THE WASHINGTON TIMES (August 18, 2019), https://www.washingtontimes.com/news/2019/aug/18/stefan-halpers-pentagon-contracts-investigation-sh/.

[HG008I][GDrive]

will determine the strategic value of exercising an option in a contract and ONA will provide its recommendation to the independent contracting authority.

a. How often does a contracting officer disagree with ONA's recommendation and opt to not exercise an option in a contract? Who then has final determination on exercising a contract option?

b. How many times over the last five years has this occurred?

7. In response to question eight of my letter, I asked if Halper's relationship with Russian intelligence officer Vyacheslav Trubnikov suggested that there may be biased and unreliable information contained within Professor Halper's deliverable. Your response was that ONA's security agency found no derogatory information on Professor Halper. Your answer is unresponsive to my question.

a. Could a relationship between a contractor and a source suggest that a deliverable may be tainted with inaccurate or misleading information, especially a source that is a known intelligence officer for a foreign, hostile government? If not, why not?

b. Do you believe that research papers containing inaccurate or misleading information could cause a conflict in ONA's mission of providing assessments of future military threats? If not, why not?

8. In response to question 13 of my letter, I asked for a list of individuals, contracted, nongovernment, or detailed, and their associated entity that would have shared workspace with ONA. Your answer indicated that in the past, there have been individuals that shared ONA's workspace.

a. Please provide a list of those individuals, and their associated entity, that shared a workspace with ONA in the last five years.

b. Would these individuals have been privy to ONA's assessment of its future needs, in terms of future research projects?

c. Has a contracted, nongoverement, or detailed individual ever, either intentionally or inadvertently, received information regarding ONA's future needs?

d. Please provide ONA's policy on separating non-ONA employees from ONA's workspace.

9. Did you provide any information relating to any Flynn-Kislyak call to the media? If so, what information?

10. Did you provide any information relating to any Flynn-Kislyak call to an individual with the knowledge that it would be shared by that individual to the media? If so, what information?

[HG008J][GDrive]

11. In your communications with Mr. Ignatius, did you ever provide Mr. Ignatius any information related to Lt. Gen. Flynn? If so, what information?

12. In your communications with Deputy Secretary of Defense Robert Work did you ever discuss any information relating to Lt. Gen. Flynn? If so, what information?

13. In your communications with Deputy Director of ONA, David Epstein, did you ever discuss any information relating to Lt. Gen. Flynn? If so, what information?

14. On what date did you become aware of Halper's role in Crossfire Hurricane? How did you become aware?

I anticipate that your written reply and most responsive documents will be unclassified. Please send all unclassified material directly to the Committee. In keeping with the requirements of Executive Order 13526, if any of the responsive documents do contain classified information, please segregate all unclassified material within the classified documents, provide all unclassified information directly to the Committee, and provide a classified addendum to the Office of Senate Security. Although the Committee complies with all laws and regulations governing the handling of classified information, it is not bound, absent its prior agreement, by any handling restrictions.

Should you have questions, please contact Joshua Flynn-Brown or Quinton Brady of my Committee staff at (202) 224-4515. Thank you for your continued attention to this important matter.

Sincerely,

Charles E. Grassley
Chairman
Committee on Finance

cc:

The Honorable Mark Esper, Secretary of Defense
Mr. Sean O'Donnell, Acting Inspector General, Department of Defense

[HG008K][GDrive]

June 18, 2020, to Mr. James Baker Director Office of Net Assessment, Department of Defense

Dear Mr. Baker: I write today about your February 5, 2020, response to my January 22, 2020, letter regarding ***Stefan Halper's work for the Office of Net Assessment (ONA)****.1 Since the beginning of my investigation, I have repeatedly requested all records related to Professor Halper's work for ONA, including travel records, pursuant to the contracts that he had with your office. However, despite these repeated requests, ONA has continually failed to furnish all requested records.* ***It appears that either ONA has refused to comply with my requests, or that ONA simply does not maintain full records of Halper's work.***

Moreover, your February 5, 2020, response appears to show that you have not performed the legally required annual "Net Assessments"—the purpose for which ONA exists. Further, your response failed to fully answer Questions 2, 3, 4(c), 4(d), 4(e), 6(a), 8, and 13 of my letter. Your response also couched unclassified work product relating to the costs to the taxpayer associated with your decisions to contract with entities for research work in a classified document. Accordingly, I formally request that you declassify, to the fullest extent possible under Executive Order 13526, the classified work product that you provided to me. Declassification is appropriate at this time because, among other factors, the taxpayers paid for those research projects and the public interest in knowing how much was spent, for what purpose it was spent, and the identity of the contract recipient far outweighs any perceived national security interest. In addition, some projects mentioned within the document have already been made public, classification cannot be used to prevent embarrassment to an agency, and classification cannot be used to hide government inefficiency from public and congressional review.

It is also perplexing that ONA continues to assert that Halper fulfilled the obligations set forth in his contracts. It has been reported by The Washington Times that many of the individuals in which Halper cited as sources in his research papers have outright denied having contributed to his work.2 This begs the question as to how ONA can continue to assert that Halper's deliverables were of "high quality" and "conformed to the requirements set forth in the contract" when citations in his work appear to give contribution to individuals who had no involvement in the work. In your February 5, 2020, response to me, you noted that ONA checks the validity of citations and supporting documentation on each project. Clearly, that did not happen with Halper's work product.

On a related topic with your work at ONA, and related to my ongoing oversight work on the now-debunked Russian collusion narrative, according to an April 29, 2020, press release by Judicial Watch you exchanged many emails and phone calls with The Washington Post reporter, David Ignatius.3 As you are aware, he first reported on the call between Lieutenant General Michael Flynn and the Russian Ambassador to the U.S., Sergey Kislyak, in The Washington Post.4 Based on a court filing by Sidney Powell, one of Flynn's attorneys, it has been alleged that you were the source of the leak of the transcripts of Flynn's calls with Kislyak.5

Included in these 143 pages of email communications are several heavily redacted communications between you and ***Deputy Secretary of Defense Robert Work and Deputy Director of ONA, David Epstein****, which would presumably be about Ignatius given the subject matter of the Judicial Watch Freedom of Information Act request. 6* ***Given the overlap in time between the majority of the emails and the leak of the call, your apparent close relationship with Mr. Ignatius, and your communications with Mr. Work and Mr. Epstein, please provide all 143 pages of email communications in unredacted form and all email communications among and between you, Mr. Work, Mr. Epstein, and Mr. Ignatius from July 1, 2016, to March 1, 2017, no later than July 2, 2020.***

In furtherance of my continued oversight into ONA contract practices, and my investigation into mishandling of the Russia investigation, please answer the following no later than July 2, 2020: [...]

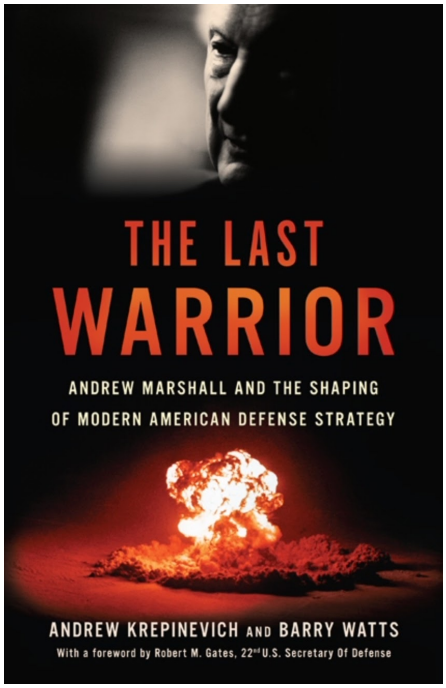
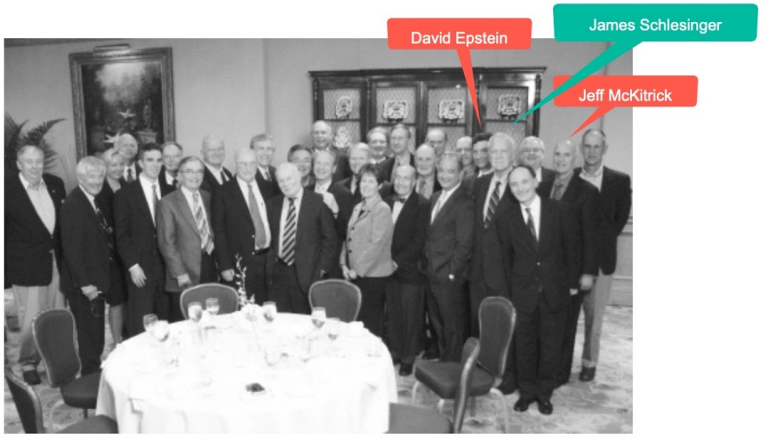
2015-the-last-warrior-andrew-marshall-modern-defense-andrew-krepinevich-and-barry-watts-img-dinner-1





Dinner during a conference on the past, present and future of net assessment, March 28, 2008. Marshall largely selected the attendees for this conference. The price of admission was to give a paper during the conference. Left to right: Jim Roche, Fred Giessler, Mie Augier, Michael Pillsbury, Andrew May, Charlie Pease, Gerry Dunne, John Battilega, Andy Marshall, Mark Herman, Lionel Tiger, Dmitri Ponomareff, Jaymie Duran, Lance Lord (behind Durnan), Karl Hasslinger, Donna Hasslinger, Phillip Karber, Jan van Tol, Charlie Wolf (in front of van Tol), Barry Watts, Enders Wimbush (behind Watts), Steve Rosen, Aaron Friedberg, David Epstein, James Schlesinger, Diego Ruiz Palmer, Wick Murray, Jeff McKitrick, Chip Pickett. PHOTO: BARRY WATTS.

1. **Ref 1 to David Epstein**
   - *Possibly the most consequential ONA assessments during the 1970s did not focus directly on military forces. Recall that when Marshall moved to the Pentagon, Schlesinger asked him to continue pushing the CIA to reconsider its estimate of the burden Soviet military programs was imposing on the USSR's economy. In 1974 Marshall hired an Air Force economist, Major Lee Badgett, to develop more inclusive dollar-cost estimates of Soviet military spending. By September 1975 Marshall and Badgett had reached a preliminary conclusion that rather than the Agency's burden estimate of 6 to 7 percent of Soviet GNP, Soviet military activities likely consumed 10 to 20 percent of the USSR's economic output. 81* ***Over the next decade, as Bob Gough, William Manthorpe, Lance Lord, and David Epstein wrote a series military investment balances for Marshall, the list of indirect costs that Soviet military programs were imposing on the USSR's economy grew.*** *They eventually included expenditures for civil defense, industrial mobilization preparations and dual-use investments as well as the costs of maintaining the Soviet empire.*
   - *The direct and indirect costs of the USSR's military efforts constituted the numerator of the burden ratio. It addressed the question: How much are the Soviets spending on their military? The denominator problem, as it came to be known, addressed the question: How large is the Soviet economy? The denominator question was first brought to Marshall's attention in 1979 by the Soviet émigré economist Igor Birman. From 1970 to 1983, the CIA estimated the Soviet GNP to be between 50 and 60 percent of US GNP. 82 In hindsight, the Soviet economy during the 1970s and 1980s was probably never greater than 25 percent of that of the United States. As the Soviet economy was roughly half the size estimated by the CIA, and the total cost of its defense expenditures larger than the Agency's estimates of the USSR's direct military expenditures, this suggested that the USSR's military might be consuming as much as 30 to 40 percent of the country's economic output. Furthermore, as became obvious in the 1980s, the Soviet economy, burdened by military spending and the inherent inefficiencies of the USSR's centralized economic planning, was encountering increasingly severe structural problems.*
2. **Ref 2 to David Epstein**
   - *Particularly for those outside ONA, the varied and complex relations between its external research program and its formal balances were often opaque. But as Marshall and Schlesinger recognized at the outset, the research program was a necessary, vital component of Marshall's development and maturation of net assessment. Without it, ONA's assessments would have been confined to official government data. But as Marshall found time and again, the data available from official sources could be nonexistent, incomplete, or simply wrong.*
   - *The debate between the CIA and ONA over the burden that Soviet military programs imposed on the USSR's economy is perhaps the most consequential example of official intelligence estimates simply getting it wrong and, hence, the need for independent research outside the government. During the 1970s most of ONA's efforts to estimate the ratio of Soviet military spending to the USSR's GNP focused on getting the numerator—how much the Soviets were spending on their military forces—right. Again, Marshall's view was that the CIA's estimates of Soviet defense spending concentrated on the visible elements of the USSR's military forces: ICBMs, naval combatants, shipyards and naval bases, fighter and bomber bases and the aircraft on them, surface-to-air missile batteries, tanks, armored fighting vehicles, military design bureaus, manufacturing plants, and so forth. With the advent of satellite photographic reconnaissance in 1960, the US intelligence community was able to build up relatively accurate estimates of the Soviet military's equipment holdings. Rightly suspicious of official Soviet figures for defense expenditures, the CIA adopted a building-block approach to estimating the USSR's military spending, based on the concept that prices × quantities = spending. 61*
   - *Identifying prices presented the greatest challenge because the USSR spent rubles, not dollars, on its military programs. Establishing a valid ruble–dollar exchange ratio proved difficult, as ruble prices in the Soviet Union were not set by market forces as were dollar prices in the United States. 62 In contrast, getting the quantities of military goods to be priced was simpler because over time the CIA was increasingly able to estimate the numbers of units in the USSR's order of battle, tables of organization and equipment for Soviet units, manpower levels, and production rates for weapons and equipment. 63 In 1967 the CIA's Office of Strategic Research (OSR) was responsible for estimating Soviet defense expenditures. A different Agency staff element, the Office of Economic Research (OER), was tasked with estimating Soviet GNP. 64 Because of this division of labor there was ambiguity about which of the two offices was responsible for estimates of the USSR's military burden. This ambiguity seems to have persisted even after OSR and OER were absorbed into the CIA's Office of Soviet Affairs (SOVA) in 1981.*
   - ***In 1983 ONA analyst David Epstein completed a two-volume assessment of the US-Soviet investment balance. Epstein's assessment built on the efforts of Major Lance Lord and retired Navy captain William Manthorpe who had inherited the military investment portfolio from Major Robert Gough in the late 1970s. The assessment broadly accepted CIA estimates of the direct costs of Soviet weapon systems that had been generated with the Agency's building-block approach. But Soviet production rates were hard to square with estimates of the USSR's military burden. In 1986 the CIA and the DIA estimated that over the***

years 1974–1985, the USSR had procured three times as many ICBMs and SLBMs as had the United States, nine times as many surface-to-air missiles, three times as many tanks, and ten times as many artillery pieces. 65 Even though US systems were generally more costly than their Soviet counterparts, the USSR's dramatically higher production rates suggested that the burden imposed on the Soviet economy should be higher than the CIA's estimate of less than 14 percent, which had been revised upward from its earlier estimates of roughly 6–7 percent. 66

- *There were also at least two sources of "indirect" military costs. One consisted of costs incurred outside the country's defense budget where the Soviet military acquired resources or influenced their allocation to satisfy wartime requirements. Here Marshall cited as examples the fact that Aeroflot passenger aircraft and the USSR's merchant marine fleet incorporated additional features—at additional cost—to enable them to transport men and equipment in time of war. Marshall also pointed to the costs incurred by the Soviets in providing economic and military aid to its satellites and clients—in effect, the costs of sustaining the Soviet Union's external empire. 67*
- *There was yet another tranche of expenditures beyond the direct costs of Soviet military programs. In the spring of 2001 Marshall met in Paris with Colonel Vitaly V. Shlykov, who had been in one of the major planning sections of the Soviet General Staff. Shlykov revealed that the Soviet military leaders had accumulated and incurred the cost of maintaining "gigantic war reserve stocks" intended to help match their estimates of US production if the country mobilized fully as it had done in World War II.*

3. **Ref 3 to David Epstein**
   - ***Perhaps the most obvious accomplishment to point to is Marshall's work on estimating the burden that Soviet military programs imposed on the USSR's economy during the 1970s and 1980s.*** *This was one of the first issues Schlesinger asked Marshall to pursue. Schlesinger told Marshall to push the CIA to reconsider its estimate that only 6 to 7 percent of the USSR's economic output was going to military programs. If the CIA's economists were correct and Soviet central planners were "miracle workers," then time was on the Soviet Union's side in their long-term competition with the United States. If Schlesinger and Marshall were right, then the situation over the long-term was more favorable to the United States, with important implications for the development of strategy.*
   - *Right to the end of the Cold War the economists at the CIA resisted Marshall's arguments on the need for a fundamental rethinking of their burden estimates. To be sure, there was the May 1976 "bombshell" when, virtually overnight the agency abruptly doubled its estimate of the USSR's military burden to 11 to 13 percent. 23 But as late as 1987, both the CIA and the DIA insisted that the burden had risen to only 15 to 17 percent of the USSR's GNP in the early 1980s. 24*
   - *Marshall never gave up on this issue, never stopped questioning the official estimates.* ***In 1975, Marshall estimated the USSR's military burden to be roughly double the CIA's estimate. 25 By 1988 he and David Epstein thought it was in the vicinity of 32 to 34 percent of Soviet GNP when indirect military costs and spending on the USSR's external empire were included. 26 These estimates proved closer to the truth than the intelligence community's by at least a factor of two. In the end, Marshall's small office, aided by its ability to fund outside research on Soviet military spending and the size of the USSR's economy, produced more accurate estimates of the USSR's military burden for senior Pentagon leaders than did the US intelligence agencies.***
   - *ONA's long-term research on the USSR's military burden had other consequences. In the mid-1970s the Office of Net Assessment's military investment assessments persuaded Rumsfeld that the Soviet military was outspending the Defense Department, that the trends were adverse, and that the US defense budget needed to be increased. 27 Later, under Ronald Reagan, Marshall's work on the USSR's defense burden inspired Weinberger's decision in the mid-1980s to embrace competitive strategies as a way of imposing disproportionate costs on the Soviets.*

4. **Ref 4 to David Epstein - Mentioning of The Future Security Environment working group**
   - *5 . Marshall and Wolf, The Future Security Environment, 26. The working group included Eliot Cohen, David Epstein, Fritz Ermarth, Lawrence Gershwin, James Roche, Thomas Rona, Stephen Rosen, Dennis Ross, Notra Trulock, and Dov Zakheim.*

Overview

Ruth Epstein has more than 30 years of corporate, securities and financial services experience, including five years with the Securities and Exchange Commission in the Division of Enforcement and the Office of General Counsel. Ruth concentrates on complex issues faced by participants in the investment management and variable insurance products industries and counsels financial services clients on a broad range of regulatory, governance, product development and enforcement issues. She assists clients in responding and adapting to expanded regulation of their industry by the Commodity Futures Trading Commission (CFTC) and the National Futures Association (NFA).

Ruth is a frequent author and lecturer on topics affecting her clients. In recent years, she has co-authored four "friend of the Court briefs" in matters of critical importance to the industry, including two in the U.S. Supreme Court – Jones v. Harris Associates LP (standard for review of advisory fees) and Janus Capital Group, Inc., et al. v. First Derivative Traders (responsibility for statements in mutual fund prospectuses).

As co-chair of the American Bar Association's Sub-Committee on Securities Activities of Insurance Companies, Ruth took an active role in the debate surrounding a number of important regulatory initiatives affecting funds and variable products, including the SEC's summary prospectus and XBRL proposals. She is actively involved with clients and industry groups in dialogue with the CFTC regarding the CFTC's regulation of funds and advisers, in connection with related rulemaking proposals and issuance of interpretative guidance

Father in-law - David Seligson

Father-in-law

https://www.legacy.com/obituaries/nhregister/obituary.aspx?n=david-seligson&pid=149078072&fhid=4186

SELIGSON, DR. DAVID David Seligson, founder and former Chairman of the Department of Laboratory Medicine at Yale Medical School, died on March 3 at his home in Branford, Connecticut. Dr. Seligson was born in Philadelphia in 1916 to Philip and Channah Schloss Seligson. He graduated from University of Maryland and received a D. Sc from Johns Hopkins University and and an MD from the University of Utah. In 1953, he served as Captain in the U.S. Army, Chief of the Hepatic and Metabolic Disease Laboratory at Walter Reed Army Medical Center. He worked as Director of the Division of Biochemistry at Graduate Hospital of the University of Pennsylvania before joining Yale's Department of Internal Medicine in 1958. He was also Director of Clinical Laboratories at Yale New Haven Hosptial between 1958 and 1988. Since 1988, he has been Professor Emeritus at Yale Medical School. Dr. Seligson was a pioneer in the development of modern medical laboratory equipment and methods, vastly increasing their capacity accuracy, and automation. With his wife Harriet Tutelman Seligson (d.1986), he invented the Seligson Pipette, a semi-automatic pipette that was precise, easy to use, and self-cleaning. He was President of the American Association of Clinical Chemists in 1961-1962, and winner of that society's Ames Award in 1971, for outstanding contributions to Clinical Chemistry. He was Trustee and Honorary Doctor of Humane Letters at Quinnipiac University. He was also an accomplished sailor with over a hundred trophies won in races around eastern Long Island Sound. Dr. Seligson is survived by his brother, Sidney Seligson of Phoenix; his three children, Judith T. Seligson of Alexandria, VA, Ruth S. Epstein of Chevy Chase, MD, and Daniel A. Seligson of Palo Alto, CA and eight grandchildren. Funeral Services SUNDAY morning (TODAY), March 6, 2011, at 10;30 at the Joseph Slifka Center for Jewish Life at Yale, 80 Wall St., New Haven with Interment Services to follow at the Grove Street Cemetery. Funeral arrangements in care of the Robert E. Shure Funeral Home, New Haven

Brother in-law ?

http://mobydx.com/

Dan Seligson studied physics at MIT (SB) and UC Berkeley (PhD) before starting a 30-year career in Silicon Valley.

He worked at Intel and held executive positions at, has been advisor to, and founded or co-founded several tech and biotech startups. He has 8 US Patents and others pending in fields as diverse as analog circuit design and immunology-based diagnostics. He's been writing for the drawer and a few friends all along. Here he is in a recent interview with the publisher.

2003

Lately, Jeffrey Epstein's high-flying style has been drawing oohs and aahs: the bachelor financier lives in New York's largest private residence, claims to take only billionaires as clients, and flies celebrities including Bill Clinton and Kevin Spacey on his Boeing 727. But pierce his air of mystery and the picture changes. Vicky Ward explores Epstein's investment career, his ties to retail magnate Leslie Wexner, and his complicated past.

On Manhattan's Upper East Side, home to some of the most expensive real estate on earth, exists the crown jewel of the city's residential town houses. With its 15-foot-high oak door, huge arched windows, and nine floors, it sits on—or, rather, commands—the block of 71st Street between Fifth and Madison Avenues. Almost ludicrously out of proportion with its four- and five-story neighbors, it seems more like an institution than a house. This is perhaps not surprising—until 1989 it was the Birch Wathen private school. Now it is said to be Manhattan's largest private residence.

Inside, amid the flurry of menservants attired in sober black suits and pristine white gloves, you feel you have stumbled into someone's private Xanadu. This is no mere rich person's home, but a high-walled, eclectic, imperious fantasy that seems to have no boundaries.

The entrance hall is decorated not with paintings but with row upon row of individually framed eyeballs; these, the owner tells people with relish, were imported from England, where they were made for injured soldiers. Next comes a marble foyer, which does have a painting, in the manner of Jean Dubuffet … but the host coyly refuses to tell visitors who painted it. In any case, guests are like pygmies next to the nearby twice-life-size sculpture of a naked African warrior.

Despite its eccentricity the house is curiously impersonal, the statement of someone who wants to be known for the scale of his possessions. Its occupant, financier Jeffrey Epstein, 50, admits to friends that he likes it when people think of him this way. A good-looking man, resembling Ralph Lauren, with thick gray-white hair and a weathered face, he usually dresses in jeans, knit shirts, and loafers. He tells people he bought the house because he knew he "could never live anywhere bigger." He thinks 51,000 square feet is an appropriately large space for someone like himself, who deals mostly in large concepts—especially large sums of money.

Guests are invited to lunch or dinner at the town house—Epstein usually refers to the former as "tea," since he likes to eat bite-size morsels and drink copious quantities of Earl Grey. (He does not touch alcohol or tobacco.) Tea is served in the "leather room," so called because of the cordovan-colored fabric on the walls. The chairs are covered in a leopard print, and on the wall hangs a huge, Oriental fantasy of a woman holding an opium pipe and caressing a snarling lionskin. Under her gaze, plates of finger sandwiches are delivered to Epstein and guests by the menservants in white gloves.

Upstairs, to the right of a spiral staircase, is the "office," an enormous gallery spanning the width of the house. Strangely, it holds no computer. Computers belong in the "computer room" (a smaller room at the back of the house), Epstein has been known to say. The office features a gilded desk (which Epstein tells people belonged to banker J. P. Morgan), 18th-century black lacquered Portuguese cabinets, and a nine-foot ebony Steinway "D" grand. On the desk, a paperback copy of the Marquis de Sade's The Misfortunes of Virtue was recently spotted. Covering the floor, Epstein has explained, "is the largest Persian rug you'll ever see in a private home—so big, it must have come from a mosque." Amid such splendor, much of which reflects the work of the French decorator Alberto Pinto, who has worked for Jacques Chirac and the royal families of Jordan and Saudi Arabia, there is one particularly startling oddity: a stuffed black poodle, standing atop the grand piano. "No decorator would ever tell you to do that," Epstein brags to visitors. "But I want people to think what it means to stuff a dog." People can't help but feel it's Epstein's way of saying that he always has the last word.

In addition to the town house, Epstein lives in what is reputed to be the largest private dwelling in New Mexico, on an $18 million, 7,500-acre ranch which he named "Zorro." "It makes the town house look like a shack," Epstein has said. He also owns Little St. James, a 70-acre island in the U.S. Virgin Islands, where the main house is currently being renovated by Edward Tuttle, a designer of the Amanresorts. There is also a $6.8 million house in Palm Beach, Florida, and a fleet of aircraft: a

Gulfstream IV, a helicopter, and a Boeing 727, replete with trading room, on which Epstein recently flew President Clinton, actors Chris Tucker and Kevin Spacey, supermarket magnate Ron Burkle, Lew Wasserman's grandson, Casey Wasserman, and a few others, on a mission to explore the problems of AIDS and economic development in Africa.

Epstein is charming, but he doesn't let the charm slip into his eyes. They are steely and calculating, giving some hint at the steady whir of machinery running behind them. "Let's play chess," he said to me, after refusing to give an interview for this article. "You be white. You get the first move." It was an appropriate metaphor for a man who seems to feel he can win no matter what the advantage of the other side. His advantage is that no one really seems to know him or his history completely or what his arsenal actually consists of. He has carefully engineered it so that he remains one of the few truly baffling mysteries among New York's moneyed world. People know snippets, but few know the whole.

"He's very enigmatic," says Rosa Monckton, the former C.E.O. of Tiffany & Co. in the U.K. and a close friend since the early 1980s. "You think you know him and then you peel off another ring of the onion skin and there's something else extraordinary underneath. He never reveals his hand…. He's a classic iceberg. What you see is not what you get."

Even acquaintances sense a curious dichotomy: Yes, he lives like a "modern maharaja," as Leah Kleman, one of his art dealers, puts it. Yet he is fastidiously, almost obsessively private—he lists himself in the phone book under a pseudonym. He rarely attends society gatherings or weddings or funerals; he considers eating in restaurants like "eating on the subway"—i.e., something he'd never do. There are many women in his life, mostly young, but there is no one of them to whom he has been able to commit. He describes his most public companion of the last decade, Ghislaine Maxwell, 41, the daughter of the late, disgraced media baron Robert Maxwell, as simply his "best friend." He says she is not on his payroll, but she seems to organize much of his life—recently she was making telephone inquiries to find a California-based yoga instructor for him. (Epstein is still close to his two other long-term girlfriends, Paula Heil Fisher, a former associate of his at the brokerage firm Bear Stearns and now an opera producer, and Eva Andersson Dubin, a doctor and onetime model. He tells people that when a relationship is over the girlfriend "moves up, not down," to friendship status.)

Some of the businessmen who dine with him at his home—they include newspaper publisher Mort Zuckerman, banker Louis Ranieri, Revlon chairman Ronald Perelman, real-estate tycoon Leon Black, former Microsoft executive Nathan Myhrvold, Tom Pritzker (of Hyatt Hotels), and real-estate personality Donald Trump—sometimes seem not all that clear as to what he actually does to earn his millions. Certainly, you won't find Epstein's transactions written about on Bloomberg or talked about in the trading rooms. "The trading desks don't seem to know him. It's unusual for animals that big not to leave any footprints in the snow," says a high-level investment manager.

Unlike such fund managers as George Soros and Stanley Druckenmiller, whose client lists and stock maneuverings act as their calling cards, Epstein keeps all his deals and clients secret, bar one client: billionaire Leslie Wexner, the respected chairman of Limited Brands. Epstein insists that ever since he left Bear Stearns in 1981 he has managed money only for billionaires—who depend on him for discretion. "I was the only person crazy enough, or arrogant enough, or misplaced enough, to make my limit a billion dollars or more," he tells people freely. According to him, the flat fees he receives from his clients, combined with his skill at playing the currency markets "with very large sums of money," have afforded him the lifestyle he enjoys today.

Why do billionaires choose him as their trustee? Because the problems of the mega-rich, he tells people, are different from yours and mine, and his unique philosophy is central to understanding those problems: "Very few people need any more money when they have a billion dollars. The key is not to have it do harm more than anything else…. You don't want to lose your money."

He has likened his job to that of an architect—more specifically, one who specializes in remodeling: "I always describe [a billionaire] as someone who started out in a small home and as he became wealthier had add-ons. He added on another addition, he built a room over the garage … until you have a house that is usually a mess…. It's a large house that has been put together over time where no one could foretell the financial future and their accompanying needs."

He makes it sound as though his job combines the roles of real-estate agent, accountant, lawyer, money manager, trustee, and confidant. But, as with Jay Gatsby, myths and rumor swirl around Epstein.

Here are some of the hard facts about Epstein—ones that he doesn't mind people knowing: He grew up middle-class in Brooklyn. His father worked for the city's parks department. His parents viewed education as "the way out" for him and his younger brother, Mark, now working in real estate. Jeffrey started to play the piano—for which he maintains a passion—at five, and he went to Brooklyn's Lafayette High School. He was good at mathematics, and in his early 20s he got a job teaching physics and math at Dalton, the elite Manhattan private school. While there he began tutoring the son of Bear Stearns chairman Ace Greenberg and was friendly with a daughter of Greenberg's. Soon he went to Bear Stearns, where, under the mentorship of both Greenberg and current Bear Stearns C.E.O. James Cayne, he did well enough to become a limited partner—a rung beneath full partner. He abruptly departed in 1981 because, he has said, he wanted to run his own business.

Thereafter the details recede into shadow. A few of the handful of current friends who have known him since the early 1980s recall that he used to tell them he was a "bounty hunter," recovering lost or stolen money for the government or for very rich people. He has a license to carry a firearm. For the last 15 years, he's been running his business, J. Epstein & Co.

Since Leslie Wexner appeared in his life—Epstein has said this was in 1986; others say it was in 1989, at the earliest—he has gradually, in a way that has not generally made headlines, come to be accepted by the Establishment. He's a member of various commissions and councils: he is on the Trilateral Commission, the Council on Foreign Relations, and the Institute of International Education.

His current fan club extends to Cayne, Henry Rosovsky, the former dean of Harvard's Faculty of Arts and Sciences, and Larry Summers, Harvard's current president. Harvard law professor Alan Dershowitz says, "I'm on my 20th book…. The only person outside of my immediate family that I send drafts to is Jeffrey." Real-estate developer and philanthropist Marshall Rose, who has worked with Epstein on projects in New Albany, Ohio, for Wexner, says, "He digests and decodes the information very rapidly, which is to me terrific because we have shorter meetings."

Also on the list of admirers are former senator George Mitchell and a gaggle of distinguished scientists, most of whom Epstein has helped fund in recent years. They include Nobel Prize winners Gerald Edelman and Murray Gell-Mann, and mathematical biologist Martin Nowak. When these men describe Epstein, they talk about "energy" and "curiosity," as well as a love for theoretical physics that they don't ordinarily find in laymen. Gell-Mann rather sweetly mentions that "there are always pretty ladies around" when he goes to dinner chez Epstein, and he's under the impression that Epstein's clients include the Queen of England. Both Nowak and Dershowitz were thrilled to find themselves shaking the hand of a man named "Andrew" in Epstein's house. "Andrew" turned out to be Prince Andrew, who subsequently arranged to sit in the back of Dershowitz's law class.

Epstein gets annoyed when anyone suggests that Wexner "made him." "I had really rich clients before," he has said. Yet he does not deny that he and Wexner have a special relationship. Epstein sees it as a partnership of equals. "People have said it's like we have one brain between two of us: each has a side."

"I think we both possess the skill of seeing patterns," says Wexner. "But Jeffrey sees patterns in politics and financial markets, and I see patterns in lifestyle and fashion trends. My skills are not in investment strategy, and, as everyone who knows Jeffrey knows, his are not in fashion and design. We frequently discuss world trends as each of us sees them."

By the time Epstein met Wexner, the latter was a retail legend who had built a $3 billion empire—one that now includes Victoria's Secret, Express, and Bath & Body Works—from $5,000 lent him by his aunt. "Wexner saw in Jeffrey the type of person who had the potential to realize his [Jeffrey's] dreams," says someone who has worked closely with both men. "He gave Jeffrey the ball, and Jeffrey hit it out of the park."

Wexner, through a trust, bought the town house in which Epstein now lives for a reported $13.2 million in 1989. In 1993, Wexner married Abigail Koppel, a 31-year-old lawyer, and the newlyweds relocated to Ohio; in 1996, Epstein moved into the town house. Public documents suggest that the house is still owned by the trust that bought it, but Epstein has said that he now owns the house.

Wexner trusts Epstein so completely that he has assigned him the power of fiduciary over all of his private trusts and foundations, says a source close to Wexner. In 1992, Epstein even persuaded Wexner to put him on the board of the Wexner Foundation in place of Wexner's ailing mother. Bella Wexner recovered and demanded to be reinstated. Epstein has said they settled by splitting the foundation in two.

Epstein does not care that he comes between family members. In fact, he sees it as his job. He tells people, "I am there to represent my client, and if my client needs protecting—sometimes even from his own family—then it's often better that people hate me, not the client."

"You've probably heard I'm vicious in my representation of my clients," he tells people proudly; Leah Kleman describes his haggling over art prices as something like a scene out of the movie Mad Max: Beyond Thunderdome. Even a former mentor says he's seen "the dark side" of Epstein, and a Bear Stearns source recalls a meeting in which Epstein chewed out a team making a presentation for Wexner as being so brutal as to be "irresponsible."

One reporter, in fact, received three threats from Epstein while preparing a piece. They were delivered in a jocular tone, but the message was clear: There will be trouble for your family if I don't like the article.

On the other hand, Epstein is clearly very generous with friends. Joe Pagano, an Aspen-based venture capitalist, who has known Epstein since before his Bear Stearns days, can't say enough nice things: "I have a boy who's dyslexic, and Jeffrey's gotten close to him over the years.... Jeffrey got him into music. He bought him his first piano. And then as he got to school he had difficulty ... in studying ... so Jeffrey got him interested in taking flying lessons."

Rosa Monckton recalls Epstein telling her that her daughter, Domenica, who suffers from Down syndrome, needed the sun, and that Rosa should feel free to bring her to his house in Palm Beach anytime.

Some friends remember that in the late 80s Epstein would offer to upgrade the airline tickets of good friends by affixing first-class stickers; the only problem was that the stickers turned out to be unofficial. Sometimes the technique worked, but other times it didn't, and the unwitting recipients found themselves exiled to coach. (Epstein has claimed that he paid for the upgrades, and had no knowledge of the stickers.) Many of those who benefited from Epstein's largesse claim that his generosity comes with no strings attached. "I never felt he wanted anything from me in return," says one old friend, who received a first-class upgrade.

Epstein is known about town as a man who loves women—lots of them, mostly young. Model types have been heard saying they are full of gratitude to Epstein for flying them around, and he is a familiar face to many of the Victoria's Secret girls. One young woman recalls being summoned by Ghislaine Maxwell to a concert at Epstein's town house, where the women seemed to outnumber the men by far. "These were not women you'd see at Upper East Side dinners," the woman recalls. "Many seemed foreign and dressed a little bizarrely." This same guest also attended a cocktail party thrown by Maxwell that Prince Andrew attended, which was filled, she says, with young Russian models. "Some of the guests were horrified," the woman says.

"He's reckless," says a former business associate, "and he's gotten more so. Money does that to you. He's breaking the oath he made to himself—that he would never do anything that would expose him in the media. Right now, in the wake of the publicity following his trip with Clinton, he must be in a very difficult place."

According to S.E.C. and other legal documents unearthed by VANITY FAIR, Epstein may have good reason to keep his past cloaked in secrecy: his real mentor, it might seem, was not Leslie Wexner but Steven Jude Hoffenberg, 57, who, for a few months before the S.E.C. sued to freeze his assets in 1993, was trying to buy the New York Post. He is currently incarcerated in the Federal Medical Center in Devens, Massachusetts, serving a 20-year sentence for bilking investors out of more than $450 million in one of the largest Ponzi schemes in American history.

When Epstein met Hoffenberg in London in the 1980s, the latter was the charismatic, audacious head of the Towers Financial Corporation, a collection agency that was supposed to buy debts that people owed to hospitals, banks, and phone companies. But Hoffenberg began using company funds to pay off earlier investors and service a lavish lifestyle that included a mansion on Long Island, homes on Manhattan's Sutton Place and in Florida, and a fleet of cars and planes.

Hoffenberg and Epstein had much in common. Both were smart and obsessed with making money. Both were from Brooklyn. According to Hoffenberg, the two men were introduced by Douglas Leese, a defense contractor. Epstein has said they were introduced by John Mitchell, the late attorney general.

Epstein had been running International Assets Group Inc. (I.A.G.), a consulting company, out of his apartment in the Solo building on East 66th Street in New York. Though he has claimed that he managed money for billionaires only, in a 1989 deposition he testified that he spent 80 percent of his time assisting people recover stolen money from fraudulent brokers and lawyers. He was also not above entering into risky, tax-sheltered oil and gas deals with much smaller investors. A lawsuit that Michael Stroll, the former head of Williams Electronics Inc., filed against Epstein shows that in 1982 I.A.G. received an investment from Stroll of $450,000, which Epstein put into oil. In 1984 Stroll asked for his money back; four years later he had received only $10,000. Stroll lost the suit, after Epstein claimed in court, among other things, that the check for $10,000 was for a horse he'd bought from Stroll. "My net worth never exceeded four and a half million dollars," Stroll has said.

Hoffenberg, says a close friend, "really liked Jeffrey.... Jeffrey has a way of getting under your skin, and he was under Hoffenberg's." Also appealing to Hoffenberg were Epstein's social connections; they included oil mogul Cece Wang (father of the designer Vera) and Mohan Murjani, whose clothing company grew into Gloria Vanderbilt Jeans. Epstein lived large even then. One friend recalls that when he took Canadian heiress Wendy Belzberg on a date he hired a Rolls-Royce especially for the occasion. (Epstein has claimed he owned it.)

In 1987, Hoffenberg, according to sources, set Epstein up in the offices he still occupies in the Villard House, on Madison Avenue, across a courtyard from the restaurant Le Cirque. Hoffenberg hired his new protégé as a consultant at $25,000 a month, and the relationship flourished. "They traveled everywhere together—on Hoffenberg's plane, all around the world, they were always together," says a source. Hoffenberg has claimed that Epstein confided in him, saying, for example, that he had left Bear Stearns in 1981 after he was discovered executing "illegal operations."

Several of Epstein's Bear Stearns contemporaries recall that Epstein left the company very suddenly. Within the company there were rumors also that he was involved in a technical infringement, and it was thought that the executive committee asked that he resign after his two supporters, Ace Greenberg and Jimmy Cayne, were

outnumbered. Greenberg says he can't recall this; Cayne denies it happened, and Epstein has denied it as well. "Jeffrey Epstein left Bear Stearns of his own volition," says Cayne. "It was never suggested that he leave by any member of management, and management never looked into any improprieties by him. Jeffrey said specifically, 'I don't want to work for anybody else. I want to work for myself.'" Yet, this is not the story that Epstein told to the S.E.C. in 1981 and to lawyers in a 1989 deposition involving a civil business case in Philadelphia.

In 1981 the S.E.C.'s Jonathan Harris and Robert Blackburn took Epstein's testimony and that of other Bear Stearns employees in part of what became a protracted case about insider trading around a tender offer placed on March 11, 1981, by the Seagram Company Ltd. for St. Joe Minerals Corp. Ultimately several Italian and Swiss investors were found guilty, including Italian financier Giuseppe Tome, who had used his relationship with Seagram owner Edgar Bronfman Sr. to obtain information about the tender offer.

After the tender offer was announced, the S.E.C. began investigating trades involving St. Joe at Bear Stearns and other firms. Epstein resigned from Bear Stearns on March 12. The S.E.C. was tipped off that Epstein had information on insider trading at Bear Stearns, and it was therefore obliged to question him. In his S.E.C. testimony, given on April 1, 1981, Epstein claimed that he had found "offensive" the way Bear Stearns management had handled a disciplinary action following its discovery that he had committed a possible "Reg D" violation—evidently he had lent money to his closest friend. (In the 1989 deposition he said that he'd lent approximately $20,000 to Warren Eisenstein, to buy stock.) Such an action could have been considered improper, although Epstein claimed he had not realized this until afterward.

According to Epstein, Bear Stearns management had questioned him about the loan around March 4. The questioners, Epstein said, were Michael (Mickey) Tarnopol and Alvin Einbender. In his 1989 deposition Epstein recalled that the partner who had made an "issue" of the matter was Marvin Davidson. On March 9, Epstein said, he had met with Tarnopol and Einbender again, and the two partners told him that the executive committee had weighed the offense, together with previous "carelessness" over expenses, and he would be fined $2,500.

"There was discussion whether, in fact, I had ever put in an airline ticket for someone else and not myself and I said that it was possible, … since my secretary handles my expenses," Epstein told the S.E.C. In his 1989 testimony he stated that the "Reg D" incident had cost him a shot at partnership that year.

What the S.E.C. seemed to be especially interested in was whether there was a connection between Epstein's leaving and the alleged insider trading in St. Joe Minerals by other people at Bear Stearns:

Q: Sir, are you aware that certain rumors may have been circulating around your firm in connection with your reasons for leaving the firm?

A: I'm aware that there were many rumors.

Q: What were the rumors you heard?

A: Nothing to do with St. Joe.

Q: Can you relate what you heard?

A: It was having to do with an illicit affair with a secretary.

Q: Have you heard any other rumors suggesting that you had made a presentation or communication to the Executive Committee concerning alleged improprieties by other members or employees of Bear Stearns?

A: I, in fact, have heard that rumor, but it's been from Mr. Harris in our conversation last week.

Q: Have you heard it from anyone else?

A: No.

A little later the interview focuses on James Cayne:

Q: Did you ever hear while you were at Bear Stearns that Mr. Cayne may have trader or insider information in connection with St. Joe Minerals Corporation?

Q: Did Mr. Cayne ever have any conversation with you about St. Joe Minerals?

Q: Did you happen to overhear any conversations between Mr. Cayne and anyone else regarding St. Joe Minerals?

And still later in the questioning comes this exchange:

Q: Have you had any type of business dealings with Mr. Cayne?

A: There's no relationship with Bear Stearns.

Q: Pardon?

A: Other than Bear Stearns, no.

Q: Have you been a participant in any type of business venture with Mr. Cayne?

Q: Do you have any expectation of participating in any business venture with Mr. Cayne?

Q: Have you had any business participations with Mr. Theram?

A: No; nor do I anticipate any.

Q: Mr. Epstein, did anyone at Bear Stearns tell you in words or substance that you should not divulge anything about St. Joe Minerals to the staff of the Securities and Exchange Commission?

Q: Has anyone indicated to you in any way, either directly or indirectly, in words or substance, that your compensation for this past year or any future monies coming to you from Bear Stearns will be contingent upon your not divulging information to the Securities and Exchange Commission?

A: No.

Despite the circumstances of Epstein's leaving, Bear Stearns agreed to pay him his annual bonus—which he anticipated as being approximately $100,000.

The S.E.C. never brought any charges against anyone at Bear Stearns for insider trading in St. Joe, but its questioning seems to indicate that it was skeptical of Epstein's answers. Some sources have wondered why, if he was such a big producer at Bear Stearns, he would have given it up over a mere $2,500 fine.

Certainly the years after Epstein left the firm were not obviously prosperous ones. His luck didn't seem to change until he met Hoffenberg.

One of Epstein's first assignments for Hoffenberg was to mastermind doomed bids to take over Pan American World Airways in 1987 and Emery Air Freight Corp. in 1988. Hoffenberg claimed in a 1993 hearing before a grand jury in Illinois that Epstein came up with the idea of financing these bids through Towers's acquisition of two ailing Illinois insurance companies, Associated Life and United Fire. "He was hired by us to work on the securities side of the insurance companies and Towers Financial, supposedly to make a profit for us and for the companies," Hoffenberg reportedly told the grand jury. He also alleged that Epstein was the "technician," executing the schemes, although, having no broker's license, he had to rely on others to make the trades. Much of Hoffenberg's subsequent testimony in his criminal case has proven to be false, and Epstein has claimed he was merely asked how the bids could be accomplished and has said he had nothing to do with the financing of them. Yet Richard Allen, the former treasurer of United Fire, recalls seeing Epstein two or three times at the company. He and another executive say they had direct dealing with Epstein over the finances. And in his deposition of 1989, Epstein stated that he was the one who executed "all" Hoffenberg's instructions to buy and sell the stock. He called it "making the orders." He could not recall whether he had chosen the brokers used.

To win approval from the Illinois insurance regulators for Towers's acquisition of the companies, Hoffenberg promised to inject $3 million of new capital into them. In fact, in his grand-jury testimony Hoffenberg claimed that he, his chief operating officer, Mitchell Brater, and Epstein came up with a scheme to steal $3 million of the insurance companies' bonds to buy Pan Am and Emery stock. "Jeffrey Epstein and Mitch Brater arranged the various brokerage accounts for the bonds to be placed with in New York, and I think one in Chicago, Rodman & Renshaw," Hoffenberg reportedly said. Then, said Hoffenberg, while making it appear as though they were investing the bonds in much safer financial instruments, they used them as collateral to buy the stock. "Epstein was the person in charge of the transactions, and Mitchell Brater was assisting him with it in coordination on behalf of the insurance companies' money," Hoffenberg claimed at the time.

At one point, according to Hoffenberg, a broker forged the documents necessary for a $1.8 million check to be written on insurance-company funds. The check was used to buy more stock in the takeover targets. Meanwhile, in order to throw the insurance regulators off, the $1.8 million was reported as being safely invested in a money-market account.

United Fire's former chief financial officer Daniel Payton confirms part of Hoffenberg's account. He says he recalls making one or two telephone calls to Epstein (at Hoffenberg's direction) about the missing bonds. "He said, 'Oh, yeah, they still exist.' But we found out later that he had sold those assets … leveraged them … [and] used some margin account to take some positions in … Emery and Pan Am," says Payton.

Epstein's extraordinary creativity was, according to Hoffenberg, responsible for the purchase by the insurance companies of a $500,000 bond, with no money down. "Epstein created a great scheme to purchase a $500,000 treasury bond that would not be shown … [as] margined or collateralized," he reportedly told the grand jury. "It looked like it was free and clear but it actually wasn't," he said.

Epstein has denied he ever had any dealings with anyone from the insurance companies. But Richard Allen says he recalls talking to Epstein at Hoffenberg's direction and telling him it was urgent they retrieve the missing bonds for a state examination. According to Allen, Epstein said, "We'll get them back." He had "kind of a flippant attitude," says Allen. "They never came back."

Epstein, according to Hoffenberg, also came up with a scheme to manipulate the price of Emery Freight stock in an attempt to minimize the losses that occurred when Hoffenberg's bid went wrong and the share price began to fall. This was alleged to have involved multiple clients' accounts controlled by Epstein.

Eventually, in 1991, insurance regulators in Illinois sued Hoffenberg. He settled the case, and Epstein, who was only a paid consultant, was never deposed or accused of any wrongdoing. Barry Gross, the attorney who was handling the suit for the regulators, says of Epstein, "He was very elusive…. It was hard to really track him down. There were a substantial number of checks for significant dollars that were paid to him, I remember…. He was this character we never got a handle on. Again we presumed that he was involved with the Pan Am and Emery run that Hoffenberg made, but we never got a chance to depose him."

"From the government's discovery in the main sentencing against Hoffenberg it would seem the government was perhaps a bit lazy," says David Lewis, who represented Mitchell Brater. "They went for what they knew they could get … and that was the fraudulent promissory notes [i.e., the much larger and unrelated part of Hoffenberg's fraud, based in New York State]…. What they couldn't get, they didn't bother with."

Another lawyer involved in the criminal prosecution of Hoffenberg says, "In a criminal investigation like that, when there is a guilty plea, to be quick and dirty about it, discovery is always incomplete…. They don't have to line up witnesses; they don't have to learn every fact that might come out on cross-examination."

Epstein was involved with Hoffenberg in other questionable transactions. Financial records show that in 1988 Epstein invested $1.6 million in Riddell Sports Inc., a company that manufactures football helmets. Among his co-investors were the theater mogul Robert Nederlander and attorney Leonard Toboroff. A source close to this transaction claims that Epstein told Nederlander and Toboroff that he had raised his share of the money from a Swiss banker, whose identity they could not be allowed to know. But Hoffenberg has claimed the money came from him, and Towers's financial statements for that year show a loan to Epstein of $400,000. (Epstein has said he can't remember the details and has disputed the accuracy of the Towers financial reports.)

Around the same time, Nederlander and Toboroff let Epstein come in with them on a scheme to make money out of Pennwalt, a Pennsylvania chemical company. The plan was to group together with two other parties to take a substantial declared position in the stock. According to a source, Epstein was supposed to help Nederlander and Toboroff raise $15 million. He seemed to fail to find other investors, say those familiar with the deal. (Epstein has said he was merely an investor.) He invested $1 million, which he told his co-investors was his own money. But in his 1989 deposition he said that he put in only $300,000 of his own money. Where did the rest come from? Hoffenberg has said it came from him, in a loan that Nederlander and Toboroff didn't know about.

Two things happened that alarmed Nederlander and Toboroff. After the group signaled a possible takeover, the Pennwalt management threatened to sue the would-be raiders. Epstein was reluctant initially to give a deposition about his share of the money, telling Toboroff there were "reasons" he didn't want to. Then, after the opportunity for new investors was closed, co-investors recall Epstein announcing that he'd found one at last: Dick Snyder, then C.E.O. of the publisher Simon & Schuster, who wanted to put up approximately $500,000. (Neither Epstein nor Snyder can now recall the investment. Yet in the 1989 deposition Epstein said that he had recruited Snyder, whom he had met socially, into the deal.)

According to a source, Toboroff and Nederlander told Epstein that Snyder was too late, but, without their realizing it, Hoffenberg has claimed, Snyder wrote a check to Hoffenberg and bought out some of his investment. But then Snyder wanted out.

"Nederlander started to get these irate calls from [Snyder,] who wasn't part of the deal, saying he was owed all this money," says someone close to the deal. Toboroff and Nederlander were baffled.

Eventually, a source close to Hoffenberg says, Hoffenberg paid Snyder off.

Eventually, a source close to Hoffenberg says, Hoffenberg paid Snyder off.

Just as Nederlander and Toboroff were growing wary of Epstein, he became increasingly involved with Leslie Wexner, whom he had met through insurance executive Robert Meister and his late wife. Epstein has told people that he met Wexner in 1986 in Palm Beach, and that he won his confidence by persuading him not to invest in the stock market, just as the 1987 crash was approaching. His story has subsequently changed. When asked if Wexner knew about his connection to Hoffenberg, Epstein said that he began working for Wexner in 1989, and that "it was certainly not the same time."

Wherever and whenever it was that Epstein and Wexner actually met, there was an immediate and strong personal chemistry. Wexner says he thinks Epstein is "very smart with a combination of excellent judgment and unusually high standards. Also, he is always a most loyal friend."

Sources say Epstein proved that he could be useful to Wexner as well, with "fresh" ideas about investments. "Wexner had a couple of bad investments, and Jeffrey cleaned those up right away," says a former associate of Epstein's.

Before he signed on with Wexner, Epstein had several meetings with Harold Levin, then head of Wexner Investments, in which he enunciated ideas about currencies that Levin found incomprehensible. "In fact," says someone who used to work very closely with Wexner, "almost everyone at the Limited wondered who Epstein was; he literally came out of nowhere."

"Everyone was mystified as to what his appeal was," says Robert Morosky, a former vice-chairman of the Limited.

Much of Epstein's work is related to cleaning up, tightening budgets, and efficiencies. One person who worked for Wexner and who saw a contract drawn up between the two men says Epstein is involved in "everything, not just a little here, a little there. Everything!" In addition, he says, "Wexner likes having a hatchet man.... Whenever there is dirty work to be done he'd stick Jeffrey on it.... He has a reputation for being ruthless but he gets the job done."

Epstein has evidently been asked to fire personal-staff members when needed. "He was that mysterious person that everyone was scared to death of," says a former employee.

Meanwhile, he is also less than popular with some people outside Wexner's company with whom he now deals. "He 'inserted' himself into the construction process of Leslie Wexner's yacht.... That resulted in litigation down the road between Mr. Wexner and the shipyard that eventually built the vessel," says Lars Forsberg, a lawyer whose firm at the time, Dickerson and Reily, was hired to deal with litigation stemming from the construction of Wexner's Limitless—at 315 feet, one of the largest private yachts in the world. Evidently, Epstein stalled on paying Dickerson and Reily for its work. "It's probably once or twice in my legal career that I've had to sue a client for payment of services that he'd requested and we'd performed ... without issue on the performance," says Forsberg. In the end the matter was settled, but Epstein claims he now has no recollection of it.

The incident is one of a number of disputes Epstein has become embroiled in. Some are for sums so tiny as to be baffling; for instance, Epstein sued investment adviser Herbert Glass, who sold him the Palm Beach house in 1990, for $13,444—Epstein claimed this was owed him for furnishings removed by Glass.

In 1998 the U.S. Attorney's Office sued Epstein for illegally subletting the former home of the deputy consul general of Iran to attorney Ivan Fisher and others. Epstein paid $15,000 a month in rent to the State Department, but he charged Fisher and his colleagues $20,000. Though the exact terms of the agreement are sealed, the court ruled against Epstein.

Wexner offers some insight into his friend's combative style. "Many times people confuse winning and losing," Wexner says. "Jeffrey has the unusual quality of knowing when he is winning. Whether in conversations or negotiations, he always stands back and lets the other person determine the style and manner of the conversation or negotiation. And then he responds in their style. Jeffrey sees it in chivalrous terms. He does not pick a fight, but if there is a fight, he will let you choose your weapon."

One case is rather more serious. Currently, Citibank is suing Epstein for defaulting on loans from its private-banking arm for $20 million. Epstein claims that Citibank "fraudulently induced" him into borrowing the money for investments. Citibank disputes this charge.

The legal papers for another case offer a rare window into Epstein's finances. In 1995, Epstein stopped paying rent to his landlord, the nonprofit Municipal Arts Society, for his office in the Villard House. He claimed that they were breaking the terms of the lease by not letting his staff in at night. The case was eventually settled. However, one of the papers filed in this dispute is Epstein's financial statement for 1988, in which he claimed to be worth $20 million. He listed that he owned $7 million in securities, $1 million in cash, zero in residential property (although he told sources that he had already bought the home in Palm Beach), and $11 million in other assets, including his investment in Riddell. A co-investor in Riddell says: "The company had been bought with a huge amount of debt, and it wasn't public, so it was meaningless to attach a figure like that to it ... the price it cost was about $1.2 million." The co-investors bought out Epstein's share in Riddell in 1995 for approximately $3 million. At that time, when Epstein was asked, as a routine matter, to sign a paper guaranteeing he had access to a few million dollars in case of any subsequent disputes over the sale price, Wexner signed for him. Epstein has explained that this was because the co-investors wanted an indemnity against being sued by Wexner. One of the investors calls this "bullshit."

Epstein's appointment to the board of New York's Rockefeller University in 2000 brought him into greater social prominence. Boasting such social names as Nancy Kissinger, Brooke Astor, and Robert Bass, the board also includes such pre-eminent scientists as Nobel laureate Joseph Goldstein. "Epstein was thrilled to be elected," says someone who knows him.

After one term Epstein resigned. According to New York magazine, this was because he didn't like to wear a suit to meetings. A spokesperson for the Rockefeller board says Epstein left because he had insufficient time to commit; a board member recalls that he was "arrogant" and "not a good fit." The spokesperson admits that it is "infrequent" for board members not to be renominated after only one term.

Still, the recent spate of publicity Epstein has inspired does not seem to have fazed him. In November he was spotted in the front row of the Victoria's Secret fashion show at New York's Lexington Avenue Armory; around the same time the usual coterie of friends and beautiful women were whisked off to Little St. James (which he tells people has been renamed Little St. Jeff) for a long weekend.

Thanks to Epstein's introductions, says Martin Nowak, the biologist finds himself moving from Princeton to Harvard, where he is assuming the joint position of professor of mathematics and professor of biology. Epstein has pledged at least $25 million to Harvard to create the Epstein Program for Mathematical Biology and Evolutionary Dynamics, and Epstein will have an office at the university. The program will be dedicated to searching for nature's algorithms, a pursuit that is a specialty of Nowak's. For Epstein this must be the summit of everything he has worked toward: he has been seen proudly displaying Harvard president Larry Summers's letter of commitment as if he can't quite believe it is real. He says he was reluctant to have his name attached to the program, but Summers persuaded him. He rang his mentor Wexner about it, and Wexner told him it was all right.

An insatiable, restless soul, always on the move, Epstein builds a tremendous amount of downtime into his hectic work schedule. Yet there is something almost

programmed about his relaxation: it's as if even pleasure has to be measured in terms of self-improvement. Nowak says that, when he goes to stay with Epstein in the Caribbean, they'll get up at six and, as the sun rises, have three-hour conversations about theoretical physics. "Then he'll go off and do some work, re-appear, and we'll talk some more."

Another person who went to the island with Epstein, Maxwell, and several beautiful women remembers that the women "sat around one night teasing him about the kinds of grasping women who might want to date him. He was amused by the idea…. He's like a king in his own world."

Many people comment there is something innocent, almost childlike about Jeffrey Epstein. They see this as refreshing, given the sophistication of his surroundings. Alan Dershowitz says that, as he was getting to know Epstein, his wife asked him if he would still be close to him if Epstein suddenly filed for bankruptcy. Dershowitz says he replied, "Absolutely. I would be as interested in him as a friend if we had hamburgers on the boardwalk in Coney Island and talked about his ideas."

EDITOR'S NOTE: The original version of this story stated that Jeffrey Epstein was a member of the New York Academy of Sciences. The academy has since notified Vanity Fair that it has no record of Epstein's membership.

1974 - Insight on Jeff Epstein and Dalton (from 2019 Daily Beast article)

"I'm teaching a bunch of little brats next year."—Jeffrey Epstein, 1974-75 Dalton School Yearbook

It took a clandestine FBI-NYPD joint sting operation to arrest the elusive convicted sex offender Jeffrey E. Epstein on Saturday July 6th on the tarmac of Teterboro airport in New Jersey (a story first broken by The Daily Beast). Simultaneously, a sledgehammer was used to break the entry to his massive $77 million New York City townhouse on East 71st Street. Police recovered hundreds, possibly thousands, of nude images of young women and girls—an automatic legal problem for a man who is on multiple sex offender registries. Epstein's case may be one of the most extreme cases of organized child abuse in modern history.

Epstein is without doubt the wealthiest individual on any sex offender registry in the United States (and he is at Level 3—at greatest risk of abusing more children). On his registry entry, the following residences are listed: his $7.8 million 70-acre private island in the U.S. Virgin Islands (his primary residence owned by his Delaware-based LLC, L.S.J.), his Paris apartment on Avenue Foch (one of the most expensive addresses in the world), his $15.5 million Palm Beach estate, his $77 million New York City townhouse (a gift from Victoria's Secret founder Leslie Wexner), and his $10 million castle/ranch in New Mexico. At the bottom of his residences is another island in the Virgin Islands, Great St. James. Epstein purchased it in 2016 for $18 million and was actively (and without permit) developing an even larger compound on its 165 acres—that is, until his arrest this past Saturday.

As far as vehicles, his offender registry entries list two Gulfstream jets (though his lawyers say he sold one of them in June), two helicopters, nine Mercedes-Benzes, nine Chevy Suburbans, three Cadillac Escalades, three Harley-Davidsons, one $375k Bentley Mulsanne, a jet-ski, and other assorted items. He has wined and dined American presidents, princes, elite academics, socialites, corporate CEOs and other VIPs. His alleged victims were little girls, often economically destitute or runaways or orphans—from sixth graders to high-school sophomores. Because his alleged crimes span multiple decades, his victims likely number in the hundreds—or more.

"Unnoticed by almost everybody, travelling with her was a greying, plumpish, middle-aged American businessman who managed to avoid the photographers." —Mail on Sunday, *Nov. 15, 1992 (London edition)*

That businessman was Jeffrey Epstein. In the early 1990s, British newspapers that followed British socialite Ghislaine Maxwell (alleged to be Epstein's chief procurer of victims) tried to figure out who Epstein was. The *Mail on Sunday* asked in 1992: "But what is he—property developer, concert pianist, math teacher, corporate treasure hunter, stockbroker, merchant banker or globe-trotting businessman?" No one seemed to know.

Given Epstein's apparent mystique, I checked New York City's birth, census, and marriage records to be certain about the facts. Epstein was born Jan. 20 1953 in Brooklyn, NY. His parents were Paula (nee Stolofsky, 1918-2004) and Seymour G. Epstein (1916-1991) and they were married in Brooklyn in 1952—shortly before Jeffrey Epstein's birth.

Epstein grew up during the 1950s and 1960s in the Lafayette neighborhood around Coney Island, as documented by James Patterson, John Connolly, and Tim Malloy in their 2016 book on Epstein, *Filthy Rich*. Epstein attended the now-shuttered Lafayette High School, a working-class high school that produced a significant number of professional baseball players. Epstein's mother, Paula, was a homemaker while his father, Seymour, worked for the New York City Parks Department as a groundskeeper and gardener. During their retirement years, Epstein's parents (as well as several maternal aunts) resided in nearby properties he purchased in West Palm Beach. In 1991, Epstein's father passed away at the Cleveland Clinic in Ohio at the age of 75. His mother passed away in 2004 at age 85 in Palm Beach.

Epstein has a younger brother, Mark ("Puggy"), who has joined him in real-estate deals throughout the years. Mark operates a real-estate business, OSSA Properties, which owns some of the properties—including the apartments in the 301 East 66th Street building—where Jeffrey Epstein's alleged sex slaves and other employees were housed (real-estate ownership between the brothers may have commingled).

"Most of Epstein's college study years were spent at NYU. I verified that he did not graduate from NYU with their registrar."

Jeffrey Epstein graduated from Lafayette High School in 1969 at age 16, having skipped two grades. He was "chubby with curly hair and a high, 'hee-hee' kind of laugh," according to *Filthy Rich*. In the fall of 1969, Epstein started at Cooper Union and studied there for two years until the spring semester of 1971. Many writers say he attended New York University (NYU) after Cooper Union, but they rarely give specific dates. I decided to verify exactly when Epstein went to college and where. It turned out that Epstein was enrolled at NYU between September of 1971 and June of 1974. Thus, most of Epstein's college study years were spent at NYU. I verified that he did not graduate from NYU with their registrar.

In a 2002 profile in *New York* magazine, Thomas Landon reported that Epstein studied at NYU's Courant Institute of Mathematical Sciences. It is not clear why Epstein attended two institutions of higher education but did not graduate from either. When Epstein joined the board of Rockefeller University, he misrepresented his educational and employment background; a press release stated that he had "studied physics at Cooper Union in New York and then joined Bear Stearns, becoming a Limited Partner until 1981." Between Cooper Union and Bear Stearns, Epstein studied at NYU and was a teacher for two

years (two unreported and significant events). When a convicted sex offender facing sex-trafficking charges was first employed as a teacher, it bears at least some scrutiny.

After the summer of 1974, Epstein began working as a teacher of mathematics and physics at the Dalton School in the Upper East Side of Manhattan. It has been reported that he began there in 1973, but this is incorrect. I searched the 1973-74 Dalton yearbook and there is no mention of Jeffrey Epstein. I then searched Dalton's school newspaper and found in the September 1974 issue that "... Mr. Epstein, who will also teach physics, [has] also joined the department this year." Epstein also confirmed that he taught there between 1974 and 1976 in a deposition.

In the United States, there are various schools that educate children from the social upper classes—Kent School, Horace Mann, Miss Porter's. Dalton is among that set. These schools are often restricted to children from the "old money" stratum in society, with a small number of scholarship students or athletes from non-elite backgrounds.

In 1974, Dalton was run by headmaster Donald Barr—father of Attorney General William Barr, whose Justice Department recently began a review of Epstein's 2007 non-prosecution agreement for the Palm Beach child sexual assault charges. Writers have noted the interesting coincidence. However, Donald Barr resigned in turmoil in February of 1974 (according to the March 14, 1974 issue of *The Daltonian*) which was seven months before Jeffrey Epstein began teaching there that fall. While it is possible that Donald Barr may have hired Epstein, if he made personnel decisions long in advance, the Dalton School lost four math teachers (according to *The Daltonian*) prior to the 1974-75 school year. Therefore the school may have hired Epstein, in part, out of an urgent need to fill vacant positions—even though Epstein did not have a college degree.

"The paper reported Epstein would be starting a 'math-track team' the following year due to his 'unique philosophy of integrating physical exercise with spiritual and mathematical stimulation.'"

Peter Branch was the acting headmaster after Barr's departure and he may have hired Epstein. Full verification would require access to Dalton's personnel records, if they still retain them. I put a Freedom of Information Law (FOIL) request into the State of New York Department of Education and they reported having no teaching license on file for Epstein—this may suggest that he was not planning on a career in teaching. Unlike public schools, it should be noted, a private school like Dalton does not require its teachers to possess a state teaching license or certificate.

Update: After publication, a reporter from the *Miami Herald* kindly provided me with Branch's phone number. When he spoke with me, he noted that he was upper school director before being appointed interim headmaster at Dalton. His appointment began on July 1, 1974 and Barr's contract at Dalton expired on June 30th. Branch does not recall hiring Epstein and he is relatively certain Barr or possibly the head of the Math Department hired Epstein because hiring decisions were typically made in the spring. He also noted that Barr liked to hire unconventional teachers to enhance the educational experience for students at Dalton.

While at the Dalton School, Epstein was the coach of the math team. In competitions with several local schools, Epstein led the students to victory in one instance and to second place in another. At a February 1976 math meet, the Dalton team competed against Ramaz and the Manhattan Talmudic Academy with "Boss Epstein watching from the sidelines…" (*The Daltonian* March 5, 1976). At another match up in April 1976, Epstein told his team "a victory would be as easy as Pi." The paper reported Epstein would be starting a "math-track team" the following year due to his "unique philosophy of integrating physical exercise with spiritual and mathematical stimulation." The Dalton School students and families are comprised of some of the wealthiest families in the United States—unlike Epstein's own. But this access may have created an opening for him.

As a young man from a working-class neighborhood in Brooklyn (equipped with a deep Brooklyn accent), Jeffrey Epstein at Dalton likely had to be a "quick study" to gracefully flow among the social upper class. Vicky Ward's 2003 *Vanity Fair* profile of Epstein deemed him "The Talented Mr. Epstein"—drawing a parallel to Matt Damon's character in the 1999 film *The Talented Mr. Ripley*, where Tom Ripley cons his way into the upper class through fraud and misrepresentation (and plenty of piano playing). To wit, the April 1975 issue of *The Daltonian* covered a Parent-Teacher Association event, "the first parent-faculty musical in recent memory," noting that "Mr. Epstein proved himself to be the ivory show man on the piano."

"The April 1975 issue of The Daltonian covered a Parent-Teacher Association event, 'the first parent-faculty musical in recent memory,' noting that 'Mr. Epstein proved himself to be the ivory show man on the piano.'"

Was Epstein wooing and dazzling the parents as a means of gaining access to their rarefied world? It seems to have worked because a parent wondered what he was doing there and put him in touch with the chairman of Bear Stearns, Ace Greenberg (whose children also attended Dalton; Epstein may have tutored them). After the 1975-1976 school year was finished, Epstein informed the school he was not returning and began his career on Wall Street at Bear Stearns.

UPDATE: Peter Branch does remember how Epstein left Dalton: The math and science faculty approached him and asked him what he was "going to do about Jeff." The science faculty were in the process of evaluating teaching and found that Epstein's teaching skills had not improved over the previous year. Branch then informed Epstein that it was time to move on.

After just four years, on August 1, 1980, Bear Stearns published an advert in *The Wall Street Journal* listing all the people who had made limited partner, including Jeffrey E. Epstein (along with people such as Larry Kudlow, former CNBC commentator and current director of the National Economic Council). Epstein, it seemed, was on the path, to accumulating the *economic* riches necessary for entry into the one percent. Obtaining the *social* graces required for acceptance by the social upper class would come much later with the help of several socialites, but mostly Ghislaine Maxwell.

Epstein was permitted to plead guilty to charges of soliciting prostitution in 2008 in the State of Florida. However, his victims were children, and it has been widely pointed out, cannot give consent, and therefore cannot be prostitutes. (Epstein's lawyers tried to tarnish and humiliate the victims at the time by calling them "prostitutes," and, as *Vanity Fair* revealed, Epstein reportedly smeared the underage girls in private as "prostitutes and strippers who'd already been indoctrinated into the sex world.")

Such lax charges in the Florida case, compared to what he is now facing, were hashed out in a deal with Florida State Attorney Barry Krischer, in conjunction with Alexander Acosta (who just stepped down as President Trump's labor secretary over his role in the Epstein saga). The deal was protested by the highly professional Palm Beach police led by Chief Michael Reiter and the late Detective Joseph Recarey.

Epstein's 2019 charges are for crimes committed in New York and Florida between 2002 and 2005. However, there are allegations against Epstein from earlier time periods (such as Maria Farmer's 2019 sworn affidavit that she and her 15-year old sibling were assaulted by Epstein and Maxwell in various locations in 1996—allegations that were reportedly nixed by an editor from Vicky Ward's 2003 profile of Epstein). One thing to keep in mind is Epstein was a school teacher and would have had possible access to victims there as well. There are no reports that he did anything at Dalton school, but he was asked about his relations with students in a deposition in 2009 and here is what he said:....

His answer about the ages of his students is noteworthy. He replies “Mostly old—mostly 17 and 18.” This tells us that Epstein thinks that the ages of 17 and 18 are “old.” He is asked what subject he was teaching, and he answers truthfully, physics and mathematics. The attorney asks if any of the girls he was teaching were under age 17 at the time, and Epstein answers that he does not know—this sounds genuine. Things take a turn when the attorney asks Epstein if he had any sexual contact with any students at Dalton. Epstein answers the first time with a question, “Again?” He is asked a second time and again answers with a question, “While I was a teacher?” The attorney says yes, let’s start with that question and Epstein gives a solid “no.” The attorney presses “How about after?” and Epstein says “Not that I remember.”

In summary, Epstein revealed that he feels high-school students aged 17 to 18 years are “old” and he that he does not remember if he had sexual contact with Dalton students after he was a teacher there. The final time he is asked, he reads from a statement in which he claims that the attorney’s law firm is engaged in fraud and then pleads his Fifth Amendment rights. Questions about sexual contact with Dalton students appear to be sensitive for him. Epstein depositions are extremely difficult to read because he pleads the Fifth to almost every question—as he eventually does here.

Julie Brown of the *Miami Herald* has done a significant amount of research on the Epstein case with her and her colleagues’ award-winning Perversion of Justice series. The extensive reporting in the *Miami Herald*, The Daily Beast, and by independent journalists like Ed Opperman, Pearse Redmond, William Ramsey and others has likely influenced law enforcement to consider the new evidence uncovered by the press—including possible new locations where recruitment or abuse might have occurred.

Related to Epstein’s deposition above, Virginia Roberts Giuffre, who accused Epstein of sexually abusing her as an underage girl and loaning her out to his famous friends, claimed that Epstein “lost interest” as she got older and sent her to Thailand to bring him another victim, at which point she says she escaped from Epstein.

Another alarming detail about Epstein is reported in Vicky Ward’s 2003 *Vanity Fair* article. She noted that Epstein left a paperback copy of the Marquis de Sade’s *The Misfortunes of Virtue* lying on a table at his 71st Street townhouse. Why would Epstein have left this book out in plain view? This obscene novel (even Napoleon ordered its author jailed) is about a 12-year-old French girl, Justine, who travels alone across France and winds up in a monastery and is forced to become the sex slave of monks where she endures repeated sexual assaults and is ordered to participate in orgies. She escapes but suffers similar abuses and encounters as the story follows her life until the age of 26.

“His answer about the ages of his students is noteworthy. He replies 'Mostly old—mostly 17 and 18.'”

Justine may have been a pedophile’s fantasy story in which the victim somehow learns “virtue” from what she endures. Justine almost parallels the life of some of Epstein’s alleged victims. What is even more tragic is that in the course of her reporting, Ward found two of Epstein’s victims and their mother. Ward says they detailed in 2003 how Epstein sexually assaulted them in the mid-1990s—including the time when one was allegedly held captive for 12 hours at mogul Leslie Wexner’s Ohio property after she says Epstein and Maxwell assaulted her. (Wexner has not responded to the allegations.) Perhaps their stories might have been able to deter or expose Epstein earlier, if they had been published when the girls first came forward.

We can expect a trove of information about Epstein to continue to emerge now that he is in jail. Indeed, the *Miami Herald* reports that at least a dozen new victims have come forward since his arrest. Epstein and his accomplices may have seen his victims as little girls—but now they are strong, brave women fighting back today.

Thomas Volscho is a sociology professor at the City University of New York, College of Staten Island. He has been researching the case of Jeffrey Epstein for a book he is writing.

Nowinski mentioned in multipls SVCPs, including #14 - multiple contracts as of 1975 to this fred hutch institute - See [https://sites.google.com/a/housatonicits.com/home/research/special-virus-cancer-program]... acgually 8, 11, 12, 13, 14 (maybe more but this is all we have now)

Charles A. Evans
1912 - 2008

Charles A. Evans, Ph.D., 96, Professor Emeritus and first Chairman of the Department of Microbiology, died on December 4, 2008.

Charles (Chuck) Evans, received his B.S., M.D. and Ph.D. from the University of Minnesota. **He devoted 36 years to the University, during which time he served as the chairman of the Department of Microbiology, chairman of the University Senate, associate director of the Fred Hutchinson Cancer Research Center, and as the first director of the Office of Minority Student Affairs.** He was the last surviving department chair of the original medical school faculty. He published over two hundred articles of his scientific research focusing primarily on the study of viral infections, poliomyelitis and tumor virology. His early research focused on the growth of poliomyelitis virus in cell and tissue culture. These underappreciated studies were reported in a series of papers were singled out by John Enders in his Nobel acceptance speech for their important contributions to the development of the field. Chuck then returned his attention to papillomavirus infections in rabbits, their oncogenic potential, and immune responses of the host. Finally, in his later years, he returned to a earlier interest, the ecology of skin microflora and its role in disease.

He not only was a very productive laboratory scientist, but also was a serious naturalist, amateur ornithologist, bird watcher and skilled photographer. Everything he undertook was pursued with passionate intensity and reflected his fascination and respect for the natural world.

Dr. Evans is survived by his wife of 70 years, Allie Ann Evans. His children are Nicholas (deceased), Susan (Bill Layman), Thomas (Julia Evans), and Carol (Bill McClain), grandchildren, Hillary and Alice Evans, Kevin and Kelsey McClain, Nathan and Genevieve Layman.

Donations in Dr. Evans' memory can be made by check (payable to UW Foundation) to:

UW Medicine Development , Box 358045 . Seattle, WA 98195-8045

The Charles Evans Award Fund was established when Dr. Evans retired, in June of 1982. Contributions to this fund are made by friends, colleagues, former students and members of his family. The fund provides an annual award for the graduating microbiology major with the highest cumulative grade point average.

1977-svcp-annual-report

Role of Friend and Nowinski / Fred Hutch institute both very important !!!!

1959

The Virology and Rickettsiology Study Section (V & R SS), the regular NIH Study Section that reviewed grant proposals in the area of virology, sponsored a meeting on September 16, 1958, on “The Role of Viruses in Relation to Human Malignancies.” Fifteen expert investigators were invited to the meeting. They were: Joe Beard; Ray Bryan; John Enders; **Charles Evans (Chairman)**; **Hilary Koprowski;** Salvatore Luria; Dan Moore; Alfred Prince; Stanfield Rogers; Harry Rubin; **Albert Sabin**; **Jonas Salk**; **Richard Shope**; and Jerry Syverton. Harvey Scudder, Executive Secretary, V & R SS, and Robert Backus, NCI, provided staff support from the National Institutes of Health (NIH). The group discussed expanding the research through technological, educational and institutional means. The members focused on four major categories:

NCI Tissue Culture Consultants Meeting One of the major tools in virology research is in vitro cultivation of cells and of viruses. The effects of viruses on cells can be studied with profit in such systems. However, because investigators had generally worked largely independently, the tissue culture cell lines had been developed with little coordination or standardization. Thus, cell line names were not always accurately applied, cultures could be contaminated with viruses or bacteria, and the cell lines might not be properly characterized and stored. **The staff of the NCI asked seventeen consultants to come to the NIH May 15-16, 1959, to discuss the need for, and possible technical problems involved in, coordinating the characterization activities of investigators working with cytological materials.** These consultants were selected for their competence in various aspects of cell growth, characterization and preservation. At the meeting, the consultants generally agreed that coordination was rapidly becoming necessary: an overwhelming amount of information had been accumulated, but the data was nearly impossible to correlate because researchers had used varying methods and nonstandardized resources. They agreed that a tissue culture bank should be organized around contributions that would be made available to investigators who were participating in the program. **This Consultants Conference was Chaired by Council member Dr. Charles Evans, University of Washington**. Dr. Jerome Syverton, University of Minnesota, presented an opening statement on the “Characterization, Preservation and Supply of Tissue Culture Cell Lines.” Most of the members of the Viruses and Cancer Panel attended the meeting. The Panel met the day after the Conference and concluded that a clear need existed for a coordinated cell-characterization program and that a program should be given sufficient impetus and administrative guidance and support to assure the success of a self-sustaining program. A second Conference of the expert consultants was called for to determine how best to undertake a cooperative effort for initiating and sustaining a mammalian cell bank with insurance of quality control (Minutes of the Virus and Cancel Panel, May 1959).

APRIL 18, 1986 - Probe into Capitol Hill slaying continues

See [HM001A][GDrive]

ByJULIE BRIENZA

WASHINGTON -- The bloody body of a Capitol Hill press secretary was nude when it was found in the living room of her apartment, the victim's assistant said Friday.

Monica Thompson, assistant to press secretary Sally Heet, 35, said she has no idea who would want to kill the aide to Sen. Daniel Evans, R-Wash.

'I can't imagine anyone she knew who would want to do that, but then I don't know all of her friends,' said Thompson. An autopsy by the D.C. Medical Examiner's Office Friday showed the woman died from multiple stab wounds. The office said her death was ruled a homicide.

Although Heet's body was nude, police would not say whether she had been sexually assaulted.

Thompson was with Heet's brother, Jim Hudson, when they found her body at her third-floor Capitol Hill apartment around 10:30 a.m. Thursday. They had gone to her house when she failed to show up for work.

'She was in the living room,' Thompson said, adding that she immediately left the apartment once she saw Heet's body on the floor.

District of Columbia police said they have no suspects and no motive in the slaying.

Police said Heet's mailbox was swung open in the building's lobby, with the mail still in it. Her car was parked in front of the building.

'The police told us they've been working on it all night long, but they're not saying much else right now,' Thompson said. 'It seems to be a large priority to them. I've heard they (police) think it might be somebody she knows, but then there's the mailbox thing. So there's two conflicting stories.'

Evans' administrative assistant, Bill Jacobs, said at a Thursday news conference that it appeared that someone had met up with Heet at the mailbox.

Marian Friedman, who lives above Heet's apartment, told the Washington Post she heard no unusual noises the night before Heet's body was found.'

Heet had been the press secretary for Evans since he joined the Senate in 1983 upon the death of Sen. Henry 'Scoop' Jackson, D-Wash.

Thompson said the staff at Evans' office is trying to continue working despite their grief over the incident.

'We're a really close office,' she said. 'This is where I'd really rather be right now.'

Daniel Jackson Evans (born October 16, 1925) is an American civil engineer and former politician who served three terms as the 16th Governor of the State of Washington from 1965 to 1977, and as United States Senator represented Washington State from 1983 to 1989.[1]

Evans was seriously considered for the Republican vice presidential nomination in 1968 and 1976. At the 1968 Republican National Convention (where he gave the keynote address) Evans refused to endorse Richard Nixon for the presidential nomination, remaining a supporter of the unsuccessful candidacy of Nelson Rockefeller.[2]

Early life

Evans was born in Seattle, Washington (where he has lived as of 2007),[1] descended from a family that had first arrived in the Washington Territory in 1859; his grandfather had served in one of Washington's first state senates. He grew up in the Laurelhurst neighborhood and attended Roosevelt High School.[3]

As a young man, Evans was an Eagle Scout,[4] and served as a staff member and Hike Master at Camp Parsons, a well known Boy Scout camp in Washington State. As an adult, he was awarded the Distinguished Eagle Scout Award from the Boy Scouts of America.

After high school, he served in the United States Navy 1943–1946.[1] He first entered the V-12 Navy College Training Program and was stationed at the

University of Washington (UW), but was transferred eight months later to an ROTC program at University of California, Berkeley. He did not see combat; he was deployed to the Pacific shortly after the end of World War II as a commissioned ensign on a succession of aircraft carriers, before returning to UW in 1946.[3]

Evans graduated from the University of Washington with degrees in civil engineering (BS, 1948, MS, 1949);[1][3] the UW later (in 2007) gave him the distinction of Alumnus Summa Laude Dignitatus, the highest distinction the university confers on its graduates.[3] He returned to the United States Navy (1951–1953)[1] before working as a structural engineer[1][3] (1953–1956); in the latter capacity, he helped draw up the plans for the Alaskan Way Viaduct.[3]

Political career

Having attended Toastmasters to improve his initially abysmal public speaking style,[2] Evans served in the Washington State House of Representatives from 1956 to 1965 before being elected governor.[1]

Evans during his tenure as governor

Despite being a Republican and a self-styled conservative, Evans became known for his administration's liberal policies on environmental protection (he founded the country's first state-level Department of Ecology, which became Nixon's blueprint for the federal EPA) and strong support of the state's higher education system, including founding Washington's system of community colleges. He fought unsuccessfully for a state income tax.[4]

Evans served as governor from 1965 until 1977,[1] still the only governor to serve three four-year consecutive terms and the second to be elected to three terms after Arthur B. Langlie in Washington state history. A 1981 University of Michigan study named him one of the ten outstanding American governors of the 20th century.[4] He declined to run for a fourth term.[5] Serial killer Ted Bundy served as a campaign aide for Evans and maintained a close relationship with the Governor. During the 1972 campaign, Bundy followed Evans's Democratic opponent around the state, tape recording his speeches and reported back to Evans personally. A minor scandal later followed when the Democrats found out about Bundy, who had been posing as a college student.[*citation needed*]

From 1977 to 1983 Evans served as the second president of The Evergreen State College in Olympia,[1] which Evans had created in 1967 by signing a legislative act authorizing the formation of the college. The largest building on the Evergreen campus is named the Daniel J. Evans Library in his honor.[6] In 1983, Governor John Spellman appointed Evans to the United States Senate to fill a seat left vacant by the death of longtime senator Henry M. "Scoop" Jackson. Evans won a special election later that year against Mike Lowry and filled the remainder of Jackson's unexpired term, retiring from politics after the 1988 elections.[1][7] He was not happy as a U.S. Senator; he wrote an April 1988 piece in *The New York Times Magazine*, "Why I'm Quitting the Senate", in which he complained of "bickering and protracted paralysis".[4]

Evans voted in favor of the bill establishing Martin Luther King Jr. Day as a federal holiday and the Civil Rights Restoration Act of 1987 (as well as to override President Reagan's veto).[8][9][10] Evans voted in favor of the nomination of Robert Bork to the U.S. Supreme Court.

Later life

After leaving the Senate in 1989, Evans founded his own consulting firm, Daniel J. Evans Associates.[1] Governor Mike Lowry appointed him to the Board of Regents of the University of Washington in 1993; Evans served as the board's president from 1996 to 1997,[1] and in 1999 the Daniel J. Evans School of Public Affairs at the University was named for him. Evans also went on to work in media doing an editorial weekly on the KIRO-TV newscasts from the early to mid 1990s. Evans is a director of the Initiative for Global Development.[11]

Wilderness Preservation Efforts

Evans was a Boy Scout whose early experiences hiking in the Olympic Mountains nurtured a lifelong love of wilderness. [12] Throughout his career, Evans has proven his dedication to the great outdoors in Washington State through his action. [13]

Evans was a crucial supporter in 1968 when Congress created the North Cascades National Park. The then-governor persuaded President Gerald Ford to sign 1976 legislation creating the Alpine Lakes Wilderness Area, when the U.S. Forest Service was urging a veto. [12]

As a U.S. senator, Evans sponsored the million-acre Washington Park Wilderness Act, and legislation creating the Columbia Gorge National Scenic Area. [14] [15]

In 1989 Evans co-founded the Washington Wildlife and Recreation Coalition with Mike Lowry. [13]

In 2017, Olympic Wilderness was renamed to Daniel J. Evans Wilderness in honor of Evans. [12]

In 1968, Seattle was just one stop on the Norwegian monarch's tour of the United States. King Olav arrived from San Francisco on Wednesday afternoon May 1 and had dinner that evening at the Rainier Club with Governor Daniel J. Evans (b. 1925) and Mayor Dorm Braman (1901-1980).

https://wnpf.org/people/daniel-evans/

Daniel J. Evans

Dan Evans by Mitch Pittman

Honorary Board of Directors

Honorary Board Member | Founder and Former Washington State Governor and Senator

May this wilderness always be protected, and always be enjoyed, for generations who follow us.

Daniel J. Evans ranks as one of the most distinguished leaders in the history of the State of Washington. Perhaps best known as governor from 1965–1977, he has demonstrated a lifelong commitment to public service. Before entering politics, Evans was a civil engineer. After graduating from UW with degrees in civil engineering, he worked as a structural engineer for the City of Seattle, Associated General Contractors, and in private practice. In 1956, he entered politics as a member of the Washington State House of Representatives, where he served from 1956–1965.

He became governor of the State of Washington in 1965, ultimately serving an unprecedented three consecutive terms. He was recognized as “One of the Ten Outstanding Governors in the 20th Century” (University of Michigan study, 1981). After declining to run for office again, he assumed the presidency of Olympia’s Evergreen State College in 1977.

Evans is actively involved in a large number of community and nonprofit organizations. He chaired the National Academy of Science’s Commission on Policy Options for Global Warming and co-chaired a delegation to monitor elections in Nicaragua with former President Jimmy Carter. From 1989–1994, Evans also served as a political analyst for KIRO radio and TV. He taught as a part-time lecturer at the Evans School from March 1989–1990, and currently heads his own consulting firm, Daniel J. Evans Associates.

Born in Seattle in 1925, Evans learned an appreciation for wilderness early, summiting Silver Peak in the Cascades at age 12. In 1993, alongside legendary mountaineer Lou Whittaker and **Melinda French Gates**, he founded Washington’s National Park Fund, and he remains involved as an Honorary Board Member and friend of the Fund to this day.

HistoryLink profile for Evans, Daniel J. (b. 1925) and Nancy Bell Evans (b. 1933)

See [HL005P][GDrive]

By Cassandra Tate ; Posted 12/15/2004

Dan and Nancy Evans have devoted more than half a century to public service, in and out of political office, with a level of commitment matched by few of their fellow citizens. As a three-term governor of Washington and later United States senator, Dan Evans earned the nickname "Straight Arrow." He was so widely admired and his administration so untouched by scandal that a prominent columnist once joked he was "no fun." Nancy Evans served on the boards of innumerable educational and nonprofit organizations, including the Board of Trustees of her alma mater, Whitman College. The Evanses are known for the heft of their Rolodex and their willingness to tap into it in support of various good causes. Together they personify the term "power couple" in Washington. Among their many honors are the First Citizens award from the Seattle-King County Association of Realtors in 2003 and the A. K. Guy Award from the YMCA of Greater Seattle in 2013.

Deep Roots

Both Daniel J. Evans (born in Seattle on October 16, 1925) and Nancy Bell Evans (born in Spokane on March 21, 1933) have deep roots in the Northwest. Evans’ great-grandfather settled in Port Gamble in 1859. His maternal grandfather represented Spokane in the Washington State Senate in 1893. His father once served as King County Engineer. Nancy Bell’s father, a mining engineer and native New Yorker, settled in Spokane after a stop in Vancouver, British Columbia.

Dan Evans grew up in Seattle, Nancy Bell in Spokane. Both had politically active, civic-minded parents who engaged them in the broader world. Nancy once said that one of the lessons of her Depression-era childhood was that even if you didn’t have much money, you could still donate your time, and in any case, you had an obligation to care. “I think there was far more philanthropy than people think back then," she added. "There was not a lot of big giving like there is now, but people helped" (*Puget Sound Business Journal*).

Evans was a Boy Scout whose early experiences hiking in the Olympic Mountains nurtured a lifelong love of wilderness. He put his toe into politics for the first time in 1942, when he ran for junior class president at Roosevelt High School. He lost. It was the last election he would ever lose.

After graduating from Roosevelt in 1943 -- in the midst of World War II -- Evans served as an ensign in the U.S. Navy. He studied engineering at the University of Washington after the war, graduating with a bachelor’s degree in 1948, followed by a master’s in civil engineering a year later. He spent the next two years as a member of the City of Seattle’s structural engineering design team. When the Korean War began in 1951, he returned to the Navy as a lieutenant. At the end of that war, in 1953, he went into private practice as an engineer.

Evans’ political career began in 1956, when he was elected to the Washington State House of Representatives, a Republican in a predominately Democratic state government. He campaigned on a platform that called for better roads, bridges, and “metropolitan planning.” Quiet and unassuming, he showed an early knack for forming bipartisan coalitions, a characteristic that would mark his entire tenure in politics. His fellow legislators voted him outstanding freshman. He was later elected GOP minority floor leader.

Meanwhile, Nancy Bell was studying music at Whitman College in Walla Walla. She graduated with a bachelor of arts degree in music in 1954 and did graduate work at Eastern Washington University in Cheney before becoming a music teacher and librarian in the Shoreline School District near Seattle. She met Dan during a ski trip arranged by mutual friends. The Spokane girl and the Seattle boy married each other in 1959.

Three-Term Governor

Three-Term Governor

In November 1964, Dan Evans defeated two-term Washington Governor Albert D. Rosellini (1910-2011) in the gubernatorial race, one of the few Republicans to survive a Democratic landslide led by President Lyndon Johnson. Evans, ever the engineer, offered voters a "Blueprint for Progress." At 39, he was the youngest governor in state history. He would go on to become the only one (thus far) to serve three consecutive terms. (He won his third term, in 1972, by defeating Rosellini once again, in the latter's final attempt at a political comeback.)

Dan and Nancy moved into the governor's mansion with their two young sons, Daniel Jr. and Mark. A third son, Bruce, was born in 1966.

Evans set the tone for his administration in his first inaugural address, when he declared, "This administration is not ashamed of the word conservative and it is not afraid of the word liberal" (*The Seattle Times*, 1993). Like Teddy Roosevelt, one of his political heroes, he frequently crossed party lines. He once said he would "rather cross the aisle than cross the people," adding that there are "no Republican schools or Democrat highways, no liberal salmon or conservative parks" (*The Seattle Times*, 2002).

As governor, he pursued an agenda that has often been described as "passionately moderate." He championed the cause of education, working with the 1967 Legislature to create the state community college system, launch The Evergreen State College, and provide higher levels of support for four-year colleges and universities. He used his executive authority to establish the Washington State Indian Affairs Commission in 1967 and the Washington State Women's Council in 1971. He pushed for tax reform, supporting unpopular (and ultimately unsuccessful) efforts to implement a state income tax in 1970 and 1973. He was a strong proponent of legislation to clean up the state's air and water, restore areas damaged by strip mining, limit development of oil ports in the Strait of Juan de Fuca, and protect endangered species. During his administration Washington became the first state to create a Department of Ecology (in 1970) and the first to adopt a coastal management program (in 1976).

Evans held office during one of the more challenging periods in Washington state history. The Boeing Company, then the largest employer in the Puget Sound region, lost several important defense contracts in the late 1960s, triggering what became known as the "Boeing Bust." Boeing laid off more than 60,000 employees, cutting its workforce from 100,800 in 1967 to fewer than 40,000 in 1971. The unemployment rate rose to nearly 14 percent. Meanwhile, frustrations over the Vietnam War, civil rights, poverty, and other social issues occasionally boiled over into urban riots. Protest became almost a way of life on college campuses. "It was a heady time to be governor," Evans recalled, wryly (*Seattle Post-Intelligencer*, 2002).

A self-described "contrarian," Evans steered an independent course through those tumultuous times. He responded to a series of demonstrations by black students in 1969 by appointing the first African Americans to the boards of the Seattle Community College and the University of Washington, despite warnings that he was risking political capital by "giving in" to the demands of protestors. He offended some of his constituents by endorsing the legalization of abortion and **he dismayed others with his enthusiasm for nuclear power.**

When California Governor Jerry Brown said he didn't want any Vietnamese refugees in his state, fearing they would take jobs away from Californians, Evans invited them to come to Washington. He and Nancy personally greeted the first group of refugees to arrive. Among them were Chuong Huu Nguyen, his pregnant wife, Xuan Hoa Pham, and their five children. The Nguyens were so touched by the gesture that when their son was born a few months later, they named him Evans. When Evans Nguyen graduated from the University of Washington in 1998, former Governor Evans was in the audience to cheer him on.

During his 1972 reelection campaign, Evans also promoted a group of five ballot measures to support a plan he called "Washington Futures." Four passed. Referendum 27 improved residential, industrial, and irrigation water systems. Referendum 28 financed the development of existing recreational properties and the acquisition of new ones. Referendum 29 expanded public health and rehabilitation facilities. Referendum 31 funded construction at the state's community colleges. The only measure that did not pass -- Referendum 30 -- would have developed new public transportation infrastructure and improved existing systems. Still, with this burst of activity, "Republican Gov. Dan Evans and the Democratic Legislature were launching the environmental movement," political reporter David Ammons recalled, nearly 40 years later (*The Seattle Times*, 2008).

As First Lady of Washington, Nancy Evans helped oversee the restoration of the Governor's Mansion and the creation of the Governor's Mansion Foundation, which decorates the building's public rooms with furniture and art from the eighteenth and nineteenth centuries. She also served as a trustee of the Patrons of South Sound Cultural Activities, the State Capitol Museum, and was co-founding director of the Governor's Festival of the Arts -- all this in addition to raising three young sons.

Head Geoduck

By the late 1960s, Dan Evans was attracting national attention. He was the keynote speaker at the 1968 Republican National convention; chaired the National Governors Conference in 1974; and both Richard Nixon in 1968 and Gerald Ford in 1976 considered him as a vice presidential running mate. Nevertheless, in 1977 Evans left politics to take on what many thought was a doubtful assignment, as president of the fledgling Evergreen State College in Olympia.

Evans had long had a soft spot for Evergreen. He had supported the legislation that created the school and he had been on hand when its doors opened in 1971. An innovative four-year college, Evergreen emphasized collaborative learning and interdisciplinary studies. Students designed their own academic programs. They received narrative evaluations instead of grades. They called themselves Geoducks, adopted "Let It All Hang Out" as a school motto, and articulated their values in "The Evergreen Social Contract -- A Guide for Civility and Individual Freedom."

However, neither Evans' successor as governor, Dixy Lee Ray, nor the Legislature shared his fondness for the school. Ray tried to close it in 1981, and conservative legislators tried to do the same in 1983. Evans helped fend off both efforts. He played a key role in stabilizing the institution and improving its reputation both within the state and nationally. By the time he left, in late 1983, Evergreen was a fixture on various lists of the best liberal arts schools in the West.

While at Evergreen, Governor John Spellman appointed Evans to the Pacific Northwest Electric Power and Conservation Planning Council (later known as the Northwest Power Planning Council). The council, created by Congress to plan for the future of the Bonneville Power Administration, was charged with preparing a regional energy conservation and electric power plan and determining how to mitigate the losses of fisheries due to the federal dams on the Columbia River system, and to enhance fish and wildlife habitat. At the first meeting in April 1981, the council elected Evans its chair. **His work with the council was cut short in 1983, when Spellman appointed him to fill the Senate vacancy created by the death of Senator Henry M. ("Scoop") Jackson (1912-1983).**

Senator Evans

The former engineer, legislator, governor, and college president added another section to his resume in September 1983, when he took Jackson's seat in the

Senate. Two months later, he won a special election to complete the remaining five years of Jackson's term, defeating Democratic Congressman Mike Lowry (1939-2017). The left-leaning Lowry and the centrist Evans differed on a few key issues, but were even more markedly separated by style. As one reporter put it, "The bearded Lowry's eye-rolling, arm-waving, emotional, stump-preacher brand of rhetoric" stood in stark contrast to Evans' "cool, voice-of-reason speaking style" and "distinguished, senatorial appearance" (*Seattle Post-Intelligencer*, 1983).

Evans was assigned to two important committees in the Senate -- Energy and Natural Resources and Foreign Relations -- and he also served as vice chair of the Select Committee on Indian Affairs. But as a former governor and university president who was used to decisive action, he found the Senate more frustrating than rewarding. He complained about the lack of real debate, the influence of special interest groups, the venomous infighting, and the need for incessant campaigning. Senators no longer engaged in meaningful debate, he said, but merely delivered set speeches to a largely empty chamber; and committee meetings were often stalled by lack of a quorum.

In October 1987, he announced that he would not be a candidate for re-election. He told one interviewer that he had come to the Senate too late (at age 63) to build up enough seniority to have any real influence. But he was also deeply disappointed with the institution itself. In a lengthy article for *The New York Times*, he said he had come to Washington with romantic ideas about "the duel of debate, the exchange of ideas," and had found instead "a legislative body that had lost its focus and was in danger of losing its soul." Senators were quick to speak out on issues but slow to listen to each other or agree to compromise. "I have lived through five years of bickering and protracted paralysis," he wrote. "Five years is enough. I just can't face another six years of frustrating gridlock."

Home Again

After a brief stint as a fellow at the Institute of Politics at Harvard University, Evans returned to Washington. He and Nancy lived for a while on Bainbridge Island and then built a home in Seattle. He opened a small consulting firm, Daniel J. Evans Associates, with an office on 3rd Avenue overlooking the Alaskan Way Viaduct. He never held elective office again, although he freely shared his political viewpoints, as a commentator for KIRO-TV (from 1989 until 1994) and as a frequent contributor to newspaper editorial pages. Evans continues to write articles and speak out on issues that concern him, from global warming to Indian treaty rights to the "nasty partisanship" that he thinks characterizes politics today.

Evans joined forces with former representative (and future governor) Mike Lowry in 1989 to found the Washington Wildlife and Recreation Coalition. The coalition, a non-profit citizen group, works to identify and secure state funding for land that needs to be preserved for wildlife habitat and recreation. In 1990, the coalition "persuaded the state legislature to create the Washington Wildlife and Recreation Program," a state grant program administered by the Recreation and Conservation Office and funded by the state legislature to purchase land, restore wildlife habitat, and develop recreational facilities (Coalition website). Since 1990, the program has awarded $620 million in grants and purchased more than 350,000 acres.

In 1993, Evans put on yet another hat, when then-Governor Mike Lowry appointed him to the University of Washington's Board of Regents. At the outset of what could be considered a sixth career, Evans said, "I have been absolutely blessed to have five different careers. Each one has been absolutely marvelous because you learn new things" (*The Seattle Times*, 1994).

He quickly began to make his presence known at the UW. "At regents' meetings, where everyone is exceedingly polite, Evans pokes for answers in a booming, made-for-television voice," *The Seattle Times* reported in an article published six months after he joined the board. "Administrators noticeably squirm when he's around." Still, Evans drew wide praise for his contributions to the board. His fellow regents chose him as president in 1996-1997, and then-Governor Gary Locke reappointed him to another six-year term in 1999. *The Seattle Times* was among the many regional newspapers that endorsed the reappointment. "As a governor, former U.S. senator and one-time president of Evergreen State College, few can match Evans' breadth and depth of knowledge, experience and commitment to public service," the paper's editors concluded.

Both Dan and Nancy Evans have maintained daunting schedules during their "retirement" years. Evans' official biography lists him as a current (2004) member of a dozen corporate, educational, or non-profit boards, from Voicestream Inc. to the National Information Consortium to The Evergreen State College Foundation. Since returning to Seattle from Washington D.C. in 1989, he's been involved with more than two dozen organizations of one kind or another.

Among his more recent activities, he has joined philanthropist William H. Gates Jr., former administrator of the Environmental Protection Agency William Ruckelshaus, and chairman of Global Partnerships Bill Clapp in founding the Seattle Initiative for Global Development, an alliance of business and civic leaders who hope to make the elimination of global poverty a priority for American foreign policy.

Nancy Evans, too, has been involved with a significant number of civic and philanthropic endeavors, including serving on the Board of Trustees of Whitman College, the Seattle Symphony, Seattle's public television station KCTS, the Friends of Cancer Lifeline, and the Northwest Parkinson's Foundation. Former Seattle Symphony executive director Deborah Card credited her with building critical support for the construction of Benaroya Hall, which opened in 1998. As a trustee at Whitman, she has been an active fundraiser, and she also served as a member of the search committee to find a new president for the college. "She's just terrific at making connections and introducing people," said Tom Cronin, outgoing president of Whitman (*Puget Sound Business Journal*). (Cronin retired at the end of the 2004-2005 school year and George S. Bridges, dean and vice provost of undergraduate education at the UW, replaced him.)

Their long years of community service earned Dan and Nancy Evans a veritable bushel of awards and honors over the years. The University of Washington memorialized their names by renaming its Graduate School of Public Affairs the Daniel J. Evans School of Public Affairs in 1999 and establishing the Nancy Bell Evans Center on Nonprofits and Philanthropy at the school in 2004. The school became the Daniel J. Evans School of Public Policy and Governance in 2015. The Fred Hutchinson Cancer Research Center in Seattle made the couple one of its Business Alliance honorees for 2001. The Seattle-King County Association of Realtors honored them with its First Citizen Award in 2003. Other accolades included a Legacy Award from the Rainier Institute in 2004 and the A. K. Guy Award from the YMCA of Greater Seattle in 2013.

Announcing the Rainier Institute award, Booth Gardner, Washington governor from 1985 to 1993, and Sid Morrison, Fourth District congressman from 1981 to 1993, wrote:

"Thousands of civic and corporate leaders entered public service through the Evanses' model of leadership, one that aspires to greatness through discourse, wisdom and respect ... Many of us don't remember a time when the Evanses weren't prominent voices in our community. ... Both Dan and Nancy have been known to roll up their sleeves to help — whether it's for local charities, higher education or a family friend. ... It is that kind of diligence and commitment that has made this community a better place to live" (*The Seattle Times*, 2004).

Nancy Evans: First-rate First Lady

She takes the winter and she makes it summer

And summer could take a few lessons from her;

Picture a tomboy in lace: That's Nancy with the laughin' face!

- Phil Silvers & Jimmy Van Heusen

Bright, pretty and lots of fun, Nancy Bell, a grade-school music teacher, had no shortage of suitors. In fact, two fellas proposed to her on the same Seattle park bench in the space of a week. One was a handsome engineer named Dan Evans. That was a half century ago, and although Nancy told Dan she wanted three days to think about it - "The worst three days of my life," he says - there's never been a day when she regretted saying "Yes."

Well, there was the muggy day in August of 1966 when she was eight months pregnant with their third son. Barefoot and wearing a maternity smock, she was scampering around the yard of the Governor's Mansion, trying to corral their enormous Irish wolfhound, Peggy, who was in heat. Her spouse and his State Patrol aide, Bill Lathrop, happened to be driving by. They waved gaily and kept right on going, not realizing their services were urgently desired. When the governor strolled into the mansion a half hour later, she was livid. "You saw me chasing that damn dog. Why didn't you stop?!" Dan stammered that he was oblivious. Nancy tried to keep scowling. Then they erupted in laughter. What a sight: The First Lady, great with child, in hot pursuit of the First Pooch. Good thing a news photographer hadn't happened by. They tell the story with relish because it is a classic slice of the sometimes goofy lives they led for the 12 years they were governor and first lady. They strived to be a normal couple - hiking, biking and skiing with their three live-wire sons, playing Pickleball and Bridge with friends between bouts with legislators and visits from presidents and premieres. Nancy also welcomed hundreds of townspeople who told her they had lived in Olympia all their lives and never been to the Governor's Mansion. During their first six months in the mansion they had 10,000 visitors. Asked how she mustered the courage to entertain all those people, Nancy says, "Ignorance is bliss!" (For the record, they did discover later on that five-year-old Dan Jr. had signed his name in the guest book a dozen times in big letters.)

Nancy and Dan: still best friends after 50 years. Evans family album Nancy and Dan: still best friends after 50 years. Evans family album.

They'd been married for only five years before pulling off one of 1964's biggest political upsets. In a Democratic tsunami, Lyndon B. Johnson trounced Barry Goldwater, the hero of the Republican Right. But in Washington State, a Eagle Scout bucked the tide to defeat two-term Democrat Al Rosellini. Nancy Bell Evans, 31, the daughter of a spunky suffragist and the pride of Spokane, became the youngest First Lady in state history. Her husband, Daniel J. Evans, was 39 - the youngest governor ever.

Dan Evans served an unprecedented three consecutive terms and Nancy became one of the state's best-loved first ladies. Along the way, she saved the Governor's Mansion from being replaced by some characterless rambler, championed its renovation and redecoration and created a Mansion Foundation with a corps of dedicated volunteers. She was "a vivacious hostess, a serious leader and one hell of a mother, all at the same time - plus a remarkable wife," her husband says, adding that it's all still true. After 50 years together, they're still best friends, and Nancy is also the person Dan most trusts to give him a reality check.

"She really is the ying to dad's yang," says their son Bruce. "The degree to which they go back and forth on stuff is remarkable - not because they fundamentally disagree but because they just like to debate things. More than a lot of married couples, they still communicate in a very open way, which is a testimony to their marriage and why it has lasted so long."

Not-so-secret weapon

A few months after Dan was elected governor, the Legislature went into overtime and Nancy had to go it alone on an important trade mission to Tokyo. She'd never been away from her children for three weeks, but she dutifully packed her bags. The trip was a crash course in international diplomacy. "Japan was a very male-oriented society," Dan notes, but Nancy was a hit with everyone she encountered and made lasting friends. "It was an enormous boost to her confidence."

The first lady was the governor's not-so-secret weapon, according to campaign workers and members of his staff. "Nancy is very smart, even-keeled and politically very savvy," says Jay Fredericksen, who was Evans' press secretary in the 1970s. "As a bonus, she has this great sense of humor." She met kings and queens, "but never let anything go to her head. In 1973, we were all back East for the Republican Governors' Conference, which Nelson and Happy

Rockefeller were hosting. It was my first trip to New York City, and we were staying in an upscale hotel, so I was sort of awe-struck. I remember Nancy talking about having dinner at Rocky's town house. She said, 'My God, there's a Picasso in the bathroom!' "

Dan and Nancy with their namesake immigrant son, Evans Nguyen. Evans family album Dan and Nancy with their namesake immigrant son, Evans Nguyen. Evans family album.

Back in Olympia, Nancy had bats in her attic, although by then her campaign to make the drafty old mansion a livable place of pride for the state and its occupants was finally making real headway. Today, the mansion is the cornerstone of her legacy as first lady. When Gov. Mike Lowry and his wife Mary welcomed visitors in the 1990s, he always quipped that they were "really enjoying public housing."

Nancy Evans also sparked new interest in history and the arts in Olympia and was a founding trustee of Planned Parenthood of Thurston County. Although abortion is "not something we would ever choose," she says she has "always felt it's a woman's right, prerogative, to make that decision." She supported the 1970 statewide referendum to make abortion "legal and safe" in the early months of pregnancy. She also backed the Equal Rights Amendment and has been a longtime activist for the mentally ill and developmentally disabled. She and Dan welcomed Vietnamese refugees to Washington in the 1970s after the governor of California said there was no room at the Golden State Inn. One young immigrant couple was so grateful for their support that they named a son Evans.

Nancy at a Whitman College trustees' dinner, 2007. Whitman College. Nancy at a Whitman College trustees' dinner, 2007. Whitman College.

Nancy's "retirement" years are devoted to an ambitious array of public service, philanthropic and cultural causes. She is vice chairman of the board of KCTS, the Seattle affiliate of the Public Broadcasting System, and active with the Northwest Parkinson's Foundation. Dan's brother and Nancy's two sisters-in-law, as well as their friend, former governor Booth Gardner, have suffered from the disease. A cancer survivor, as is her husband and their granddaughter, Eloise, she helped found the Friends of Cancer Lifeline in the late 1980s and was its first chairwoman. "She takes her responsibilities to her family, her friends and her community to the nth degree," says Barbara Frederick, Cancer Lifeline's retired executive director. "Her 'community' has reached to every corner of our state. And every single thing she's involved with she does with all her energy. Her attention to detail is just remarkable."

At Whitman College, her alma mater, she has been an overseer, trustee, fundraiser and talent scout since the early 1970s. In 2009, Whitman presented her its Scribner Award for Distinguished Service.

Involved with the Seattle Symphony since the 1960s, Nancy played a major role in generating support for the world-class Benaroya Hall, and headed the search committee for a new conductor in 2009. Her husband marvels at her moxie, and willingness to take on jobs like that. Dan and a throng of others will tell you that if you pass muster with Nancy, you're bound to be all right. She is financially savvy and a good judge of character. She makes friends and forges alliances everywhere she goes. "She's just terrific at making connections and introducing people," says former Whitman president Tom Cronin.

A natural-born campaigner

Sporting a hat he was given at a Western-wear shop, Dan Evans campaigns for the U.S. Senate in 1983 with Nancy at his side. Matt McVay, Seattle Times Sporting a hat he was given at a Western-wear shop, Dan Evans campaigns for the U.S. Senate in 1983 with Nancy at his side. Matt McVay, The Seattle Times.

After deciding against a bid for a fourth term, Dan became president of The Evergreen State College during a critical period in its existence and went on to serve in the U.S. Senate. He is a bipartisan political icon in Washington State, and when he emphasizes that he couldn't have done it without his wife he's not just being gallant. Evans started his 1964 campaign for governor "with all the warmth and charisma of an iced halibut," according to historian Gordon Newell. He got a lot better, but Dan's handlers still sometimes called him "Old Gluefoot" because he dawdled and was bad at gripping and grinning. Nancy was a natural-born campaigner.

Dan often took his cues from Nancy - sometimes literally. He gave good speeches, but tended to talk too long. "They worked up this code, where Nancy would cough and Dan would realize he had to wrap it up," says Bill Jacobs, Dan's chief of staff when he was governor and later in the Senate. "One time he was just getting going and she coughs. He couldn't understand why because he thought he was doing pretty well. But he wrapped it up. Afterwards, she said, 'Why did you quit, Dan? That was really good.' And he said, 'Well, you coughed.' She laughed and said, 'Well, I really had to cough!' While that's sort of a frivolous thing, it's an example of how they related to one another and the trust that they had."

Wendy Pugnetti, who worked closely with the first lady when she was assistant press secretary in 1973, says, "Nancy is warm, gracious and smart. In today's political world, she would be a shoo-in for elected office. I admired her greatly because she juggled all those roles so well and remained just Nancy."

Former U.S. Senator Slade Gorton, one of Dan's housemates in Olympia when they were young legislators, says he concluded early on that "Nancy Evans is a very strong woman. The influence she had over her husband was both significant and positive. She certainly deserves credit for saving and restoring the mansion, for which she is best known, but her political instincts and achievements go way beyond that."

Lawmakers visiting the mansion were frequently lobbied by the first lady on her favorite causes. Nancy referred to the recalcitrant ones as "some of our 17th Century legislators." Watching his wife in action, the governor would sometimes roll his eyes. And when the guests had gone, she says he might scold, "Did you have to buttonhole that one?"

While possessed of a deft touch, Nancy Evans was also her mother's daughter. Lilith (pronounced "Lie-lith") Bell, who lived to be 94, marched for suffrage as a young woman and had a "protester's streak." Mrs. Bell once told reporters that her feistiness dated to her childhood in Kansas. "I was a preacher's kid, and I resented the feeling other people had that I should be some kind of a model child."

What's in a name?

Nancy in her baby buggy in 1933. Evans family album Nancy in her baby buggy in 1933. Evans family album.

Shakespeare's immortal Juliet declared that a rose "by any other name would smell as sweet." But it's a good thing Nancy's father was joking when he suggested she should be named Vernal Equinoxia since she was born on the first day of spring in 1933. "We're going to call her 'Vernie' for short," he told the children. "Oh, Dad, you can't do that!" they said.

Her mother wanted to name her Elizabeth Ann, but the obstetrician said "she looks like a Nancy." It's a straightforward name with a dash of playfulness. She has wonderful blue eyes, a warm smile and a contagious laugh. She is simultaneously down to earth and sophisticated, and she always reminds herself that no matter where she is or who she's with, she's still just Nancy Bell from Spokane.

"It's easy to get absorbed in whatever life you're doing without remembering how you got there," Nancy says, recalling the social whirl in Washington, D.C., when Dan was a U.S. senator. "You go to a lot of embassies and on and on. So you can quickly forget who you are and where you come from. ... I tried very hard not to." Nor did she ever want her boys afforded special treatment just because their dad was governor. As a former teacher and diligent mom, she closely followed their schoolwork. One day, Dan Jr. brought home a report marked with an "A." Nancy was dubious. "I said, 'Why did you get an 'A'?' And he said, 'Well, that's what they gave me.' Well, I know it was because he was Dan Evans' son, and he didn't deserve an 'A.' "

She was a surprise

Nancy, left, and a friend enjoying a pony ride while visiting her dad in Montana one summer in the 1930s. Evans family album Nancy, left, and a friend enjoying a pony ride while visiting her dad in Montana one summer in the 1930s. Evans family album.

Nancy's father, William L. Bell, a Stanford-educated mining engineer, was often without work during the Depression. But her parents persevered, and they loved the sound of children's laughter. Nancy was the youngest of four and a surprise. "My father was 54 when I was born," Nancy says, adding with a chuckle, "He was a very proud man, my mother said, and she was furious."

In truth, her parents and siblings - Barbara, 12 years older; Bill Jr., 9 years older, and Mary, seven years older - were all delighted with her. "I was a spoiled brat. I was doted on, and I loved it. I don't deny it," Nancy says, laughing at the memory. Some summers, when her father was working in Montana, Nancy would visit him. "Mother would put me on the train at night. We knew all the porters, everybody who worked on the trains. ... I'd be by myself, at age 6, and they'd put me in a sleeper. In the morning, they'd get me up and make sure I got dressed and everything. And my father would be there to greet me at Butte. ... They had a house up in the mountains, and I had a little Shetland pony that I rode all the time."

There are sad memories, too. Her brother contracted trench mouth, likely from a public drinking fountain, "and in those days, before antibiotics it ate away at his lower lip." The popular teenager endured several skin grafts. Without medical insurance their parents were hard-pressed. "It was a hard time anyway in mining - a hard time everywhere in America," Nancy says, noting that there were "many mouths to feed" at the Bell house. But her parents loved having young people around. One of Bill Jr.'s friends from college moved in when he was attending law school at Gonzaga. "I never knew how many people were going to be at the dinner table because my brother and sisters would often bring people over, and my mother would say, 'Stay for dinner.' She could take nothing and make it something." Father, meantime, never lost his droll sense of humor while Mother was "always encouraging" and the enforcer. "My parents brought me up to believe that you could do anything you want to do if you work hard," Nancy says. "There was no sense that I couldn't do things." Like many who grew up in that era, she's thrifty. "To this day I turn off the lights and scold my husband and my children for not doing so."

Nancy and brother Bill during World War II. Evans family album Nancy and brother Bill during World War II. Evans family album.

Then came World War II. Her brother was wounded in the Battle of the Bulge, the Nazis' go-for-broke offensive in the winter of 1944-45. "In the den, my father had on the wall a big map of Europe," Nancy recalls, "and we would try to follow Bill through his letters. You couldn't say exactly where you were because of wartime censorship. Then we learned my brother was coming through Spokane on the train on the way to Madigan Army Hospital near Tacoma. So we all went down to the train station, and I still remember this gaunt young man standing in the doorway of the train on crutches. And I thought, 'Oh my gosh, is that my brother?!' I couldn't believe it was, because he was so thin. He was so haggard looking."

Bill Bell Jr., who inherited his father's sense of humor, always said he was grateful to the Army because he was no longer self-conscious about the trench mouth scars on his lip. "People assumed it was part of the injuries he had received in the war," Nancy says, adding that "he always was a slobbery kisser." That line gives you a good idea of the Bells' upbeat outlook on life.

Nancy was "a very typical teenager," with a lot of chums, many of whom she has stayed in touch with over the years. She had been taking piano lessons since grade school from a gifted German immigrant and played for the choir and other musical productions. She was a cheerleader and rarely without a boyfriend. Many of her brother's friends were also veterans, and Nancy was impressed by their "more sophisticated" humor. "I just ate it up," she says.

Whitman calls

Evans family album Evans family album.

With graduation from Lewis & Clark High School looming in 1950, Nancy applied to several colleges. She had her heart set on Whitman, where her brother and sisters had gone. But Whitman was expensive, and Nancy was entering college on the heels of the Depression and the war. "There was financial difficulty at our house during my teens, but Mother kept saying, 'Well, don't let this detour you. There is always a way to get what you want to get.' It was always that way with Mother," Nancy recalls. "She said, 'Work hard, study hard. Maybe you can get a scholarship.' And that's what happened." Nancy competed in a classical music recital to win a music scholarship and was off to Walla Walla. "Even with a scholarship, I'm sure my mother was thinking, 'Oh, how are we going to do this?'" Nancy worked in the post office at the Student Union Building and served as an assistant to professors to help pay her tuition and expenses.

She loved Whitman's close-knitness and the whole feel of the town. Whitman has always been regarded as a very good college, but Nancy says it's now nationally recognized as "a great school" that draws extraordinary students. "I couldn't get into Whitman now," she says. "It's a wonderful school, and they really believe that the teachers are there to teach and not just do research. The faculty now, as then, spends a lot of time with the students. A lot of mentoring goes on besides the classroom stuff." Her affection for her alma mater and gratitude for the scholarships that allowed her - and thousands of others since - to get a first-rate liberal arts education are boundless. Her years of service as an overseer and trustee represent her commitment to keeping the doors open to bright young people. Dan Evans Jr. graduated with the Class of 1983.

Whitman grads, in other words, are loyal, which a certain University of Washington Engineering School graduate came to appreciate. When Nancy and Dan drove into Walla Walla in 1964 for her 10-year class reunion, the race for governor was in full swing. Everywhere they looked there were "Dan Evans" yard signs and bumper stickers. The only things they knew about him were that he had the good sense to marry a Whitmanite and that he was a Republican - in that order. Nancy says that support helped fuel Dan's upset victory.

Evans family album Evans family album.

Nancy grew up in a household where everyone talked politics. After FDR closed the gold mines during the war, her father fumed about "Roose-a-velt." (In Seattle, Dan Evans' dad, Les, was doing likewise.) However, Mr. Bell wasn't much for meetings. He liked to play devil's advocate in dinner-table debates. Mother was a Republican poll-watcher every election day, and Nancy's siblings - being much older - were active in the party. Bill Jr. managed some campaigns and Barbara Bell was a precinct committeewoman. "Everybody would enter into the discussions, so it was very much a part of our family life."

Nancy was a free-thinker, intellectually feisty like her mother, but not much of a political animal and no public speaker. When she was elected president of her sorority, Delta Gamma, her senior year, she was obliged to give the annual report for the spring alumnae banquet at the grand Marcus Whitman Hotel. "I didn't think I would get through it. I remember just gulping - ah, it was dreadful - and swallowing and not being able to go on with the words. … I remember somebody afterwards leaning over and saying, 'Gosh that was tough, wasn't it?' And I said, 'Yes, that was very tough!' It was very memorable to me because I was so bad. I could get up and play the piano … but to speak was a real challenge. I never have been a very good public speaker, but I'm better at it now than I was."

One of the fellas she dated during her college years was Bill Cowles, heir to Spokane's two leading newspapers, The Spokesman-Review and Chronicle, and considerable real estate in the Inland Empire. "We were just friends; nothing ever serious," Nancy says, but he was a good-looking guy and a great catch for any girl. "He came to the door to pick me up, and, looking down his glasses, my father said, 'What are your prospects, young man?' I was just, 'Oh, God, Daddy!' He knew full well who Bill Cowles was, but he would do that to any man who came to the house to pick up any of his daughters."

Camas or Seattle?

Graduating from Whitman in 1954 with what amounted to a dual major in music and education, Nancy received several job offers. The two most enticing were at Camas, where she could head up the music education department, and in the Shoreline School District north of Seattle, where she would be a grade-school music teacher. The Camas job paid a lot more, but it was a rural mill town. Seattle had more attractions, including concerts and thousands of college-educated people her own age. On indoctrination day for new teachers, Nancy and a pal from Whitman met two freshly minted teachers from the University of Puget Sound. The four girls rented a house in the University District from "a wonderful little old lady." Over their front door they hung a sign that combined the names of their sororities: "Chi Chi Delta Tri."

Miss Bell with a student in 1957. Evans family album Miss Bell with a student in 1957. Evans family album.

Shoreline Elementary School was brand new in 1954. In addition to a music teacher, they needed someone to set up a library. Miss Bell, who loved books, promptly volunteered and winged it for the first year. She returned home to Spokane for the summer break and took graduate courses at Eastern Washington State College in Cheney to fulfill her teaching credential requirements and learn more about librarianship and storytelling for grade-schoolers. "Another new school came along later, so I was teaching music at two schools and being the librarian as well. They gave me a budget and I got to order all these books." The storytelling was fun, but she really enjoyed teaching music to every class - kindergarten through sixth grade.

"One day the principal asked me to give a little talk at one of the PTA meetings. And I thought, ‘Oh my God, what am I going to talk about?' " She collected an armload of tambourines, cymbals, triangles and wood blocks - the stuff she routinely handed out to kindergartners to get them enthused about making music. "I passed those out at the PTA meeting because I'd been hearing parents say, ‘Well, I can't sing, so I'm sure that Johnny can't sing at all.' That was my lesson for the night. I said, ‘Don't ever say to your children, ‘I can't do this, therefore you probably can't either,' because you don't know that for a fact. Give them a chance.' " That's the Nancy Evans Theory of Elementary Education in a nutshell.

An intriguing young man

Her social life was also blossoming. "When I arrived in Seattle, I met a lot of new people and really had a wonderful time. I met a lot of great guys." One was a 32-year-old civil engineer named Dan Evans. A former naval officer, he was interested in politics and had been named the "Outstanding Freshman Legislator" of 1957.

That summer, one of Nancy's ski pals was crewing on a sailboat with Dan. She still remembers his exact words: "Nancy, I've got a young man I think you should meet." Dan joined the group for a weekend jaunt to Stevens Pass in January of 1958. He was quiet, attentive and "very good looking," Nancy says. "He kept coming along on our ski trips. Then one time I fell. All the other guys, they'd just go on, but Dan stopped. And then he asked me out."

Skiing at Sun Valley in 1956. Evans family album Skiing at Sun Valley in 1956. Evans family album.

Dan's version: "She only learned to ski because she was trying to keep up with all the guys she was dating or went skiing with. They were all pretty good skiers who wanted to go right to the top of the mountain" but "she stayed down below." Immediately smitten, Dan decided he would stick with her. Good decision. When she veered under a clump of trees "I had to get in there and pull her out. So we skied together. Then we all got together at lunch." At day's end they stopped for burgers at a diner. "It was just a place with eight or nine stools all along the bar … and I made darn sure that I sat next to her."

Nancy's first impression? "He was very quiet and shy. … He hadn't dated much. The thing I remember most, other than that he was a very nice person and a very handsome man, was his intrigue. Each time I went out with him I learned something new. I saw a man of depth. He grew on me. … He was not one of these people who just came on the first time and you learned it all. I found that very intriguing. ... I loved everything I learned. … He already had done a lot of interesting things: He was an engineer, interested in politics, athletic, very competitive … served in the Navy. There were all these things that he'd done. He had a wooden sailboat that we ended up spending a lot of time sanding and waxing and varnishing. … I learned to love sailing. We would often go over to his house and sometimes have dinner."

The sailor was making headway, but the competition was fierce. One night when he arrived at Nancy's apartment to pick her up, Dan had to make a phone call. There was a datebook by the phone, so he used some naval intelligence. "It had a little rubber stamp chained to it, with the name ‘Bob.' It was one of her boyfriends. … She was really very popular. So I opened it to see what was there and here's ‘Bob,' ‘Bob' and ‘Bob.' And then there's other dates that she had (made as well). So I carefully marked down all of the free nights I could find and made sure that I asked her out on those free nights. I really wanted to see her more frequently. And I figured, well, if she says ‘no' because she's busy and it was a free day I'll know I'm in trouble."

That spring, Nancy learned just how persistent he was. On the opening day of boating season, Dan was at the wheel of his sailboat, stopwatch in hand, ready to race. "We were about 45 seconds from the start and she decided that was the time to jump into my lap and put her arm around me. I just pushed her away. … And I said, ‘Nancy, we're only 30 seconds away from the start!' She was just really upset, but she found out how competitive I was."

In October, they took a weekend trip to Victoria with Nancy's sister Barbara and brother-in-law, Bill Ludders. They stayed at the Empress - the guys in one room, of course, and the girls in another - and had a wonderful time. "And then we came home to Seattle - back to my apartment. Dan said, ‘Well, let's go for a walk.' And I thought, ‘Well, OK, Sunday night.' So we walked up to the playfield … and we sat on the bench, and he proposed! On Saturday night of the week preceding, I had been proposed to on that same bench."

She had said "no" immediately to the earlier proposal, even though it was "very sweet." Then when Dan proposed, "all I could think of was the week before. I was so stunned because I really had not expected it. I just couldn't say 'yes' right then. I said, "Well, I've just got to think about it. Give me three days."

Evans family album June 6, 1959: The newlyweds toast one another as their parents look on. At left , Les and Irma Evans; at right, Lilith and Lawrence Bell. Evans family album.

Dan was crestfallen. Nancy was confused. He slunk home. She called her mother in Spokane. "I said, 'Dan proposed and I don't know what to do!' And Mother started laughing. She'd never even met Dan, of course. I said, 'Mother, don't laugh. It's serious.' And she said, 'Well, of course it is. I'm laughing because how can I tell you what to do?' So she was no help. I just had to assimilate the whole idea. Then Dan came over Wednesday night and I said, 'Yes.' I knew, you know. It was just 'bingo!' "

Dan says, "I was so excited I just couldn't handle it: 'I've got to tell somebody. I've got to tell somebody!' " He still had a key to his parents' house, which was only a few blocks from Nancy's apartment. Even though it was close to midnight, he "charged up the stairs," knocked on his parents' bedroom door and woke them up. Startled, they sat bolt upright in bed and said almost in unison, "What's going on?" Little wonder. That sort of exuberance - nocturnal or otherwise - was way out of character for their son.

Dan's mother "just broke into tears, she was so happy." His father, more reserved even than his son, just beamed. Nancy quips that Irma Evans "was just delighted that her oldest son was dating. It didn't matter what the girl was like." In truth, Dan's parents adored her and the feeling was mutual.

Nancy with her proud father. Evans family album Nancy with her proud father. Evans family album.

They were engaged on October 28th, 1958. Her parents came over from Spokane to meet Dan for the first time. Nancy was cooking dinner. Mother and daughter immediately repaired to the kitchen, leaving Daddy to work over Dan. "So there I am sitting with this kind of big, very impressive-looking man, and he says, 'Well, young man, my other sons-in-law always came to me and asked for my daughter's hand in marriage.' I'm, 'Ga, ga, ga.' I thought he was completely serious. And I really had a tough time even responding. It wasn't until later that I found out he was just putting me on."

Evans family album Evans family album.

Dan passed another test: He sat attentively through Nancy's nemesis - the grade school Christmas program, a command performance of her charges' musical skills to the tune of "O Little Town of Bethlehem" and "Frosty the Snowman."

"I'd arrange it so that we would have something on the stage of the lunchroom/auditorium/gym - a production. Somehow we got all the kids, plus all the parents, in that room." The future governor took note of the future first lady's organizational skills and grace under pressure. The show came off without a hitch. "I was quite pleased with myself afterwards, and Dan was very impressed. Each class had its own number and we had soloists. It was a lot of work."

They were married on June 6, 1959, at the Congregational Church in Spokane. The day's loveliest photo features Nancy, gorgeous in white lace, adjusting her proud 81-year-old father's boutonnière.

Dan took his bride on a honeymoon trip to Carmel and San Francisco in the first new car he'd ever owned - a "big-finned, gold Plymouth" - and took movies all along the way with his trusty Bolex.

Passionately moderate

Early on, Nancy had met most of the Dan Evans rat pack of bright young Republicans - notably Joel Pritchard, Chuck Moriarty, Jimmy Andersen, Slade Gorton, Don Moos and Tom Copeland. Dan was a classic progressive Republican in the Teddy Roosevelt mold. An Eagle Scout, he was a vigorous

Gorton, Don Moos and Tom Copeland. Dan was a classic progressive Republican in the Teddy Roosevelt mold. An Eagle Scout, he was a vigorous outdoorsman who loved to hike and sail. Early on, he was concerned about the environment and social justice issues. When he became governor, someone aptly described his agenda as "passionately moderate." The best thing about Dan, Nancy says, is that he always "tried to bring people together." His most famous quote is "I would rather cross the aisle than cross the people." Nancy was his political soul-mate - more liberal, perhaps, in some ways, but with solid instincts about social justice issues and fiscal responsibility. Best of all, the earnest engineer dubbed "Straight Arrow" now had a wife who turned out to be a natural-born campaigner.

"Remember," Nancy says, "I grew up listening about politics. … My parents loved to talk politics. In fact, later when she came to live with us, my mother would say, "Now Dan, I think you ought to think about this." And he'd say, "Yes, yes 'Gom.' That's our nickname for my mother because that was what her first grandchild called her. So politics came very easily to me. When I went down to Olympia the first time I was younger than they were. So they all sort of took me under their wing."

When they were getting serious, did Dan ever say, "Well, someday I'm going to be governor; we'll have three kids, and we'll live in a mansion and have teas and receptions"? Nancy guffaws: "Obviously not! I probably would have said 'no.' … There was no talk about anything like that. I didn't know what I was getting into. At that time, the Legislature was two or three months every two years. I had no idea he would ever run for governor, and I don't think he did either."

Trip of a lifetime

Nancy quit teaching after their marriage. That September, Dan came home from the engineering office with a surprise announcement: "Well, I quit my job. Why don't we plan a trip?" Flabbergasted, Nancy said, "Well, jeepers, don't you have to get a job first?" Dan said they could afford it and they'd never regret it. "We had some money because we had both been out of school for long enough, and Nancy was very frugal," Dan recalls, "even though she didn't earn much as a teacher. And I had saved some money. So why not?"

They wrote letters to tourist bureaus all over Europe, and ordered a car to pick up over there. On December 30th, they flew to Los Angeles, saw the Huskies shellac Wisconsin in the 1960 Rose Bowl game, then flew nonstop to Copenhagen on SAS. They proceeded to have the time of their lives, skiing for a month before wandering at will - Germany, Spain, Portugal and Paris - Europe for two on $10 a day, literally, except for lift tickets and gasoline. Not only will they always have Paris, Nancy was pregnant with Dan Jr. by the time they were homeward bound on a new ocean liner. "I can tell you where and when, but I'm not going to," she says with a wink and a laugh. "Our son knows."

Dan entered into a happy engineering partnership with Vic Gray. Daniel Jackson Evans Jr. was born on November 25, 1960. They moved from a one-bedroom apartment at Madison Park to their first house in Laurelhurst, atop a hill east of the UW campus.

Speaker John L. O'Brien glares at Dan Evans as the coup unfolds. Seattle Argus Speaker John L. O'Brien glares at Dan Evans as the coup unfolds. Seattle Argus.

Daniel Jackson Evans Sr., representing the 43rd District, was chosen House Republican floor leader in 1961. The braintrust of Evans, Pritchard, Gorton et al, had bigger things in mind. In 1963, they put together a coalition with dissident Democrats to oust Speaker John L. O'Brien, a quintessential Irish Catholic pol who since 1955 had wielded the gavel for a record four terms. They replaced him with a conservative "D," William S. "Big Daddy" Day, a Spokane chiropractor who was "absolutely" willing to give the Republicans some committee chairmanships. O'Brien was out-foxed, out-maneuvered and "out-flummoxed," as Jim Dolliver, the GOP consigliere, put it. "He didn't realize what was happening until the knife was going in. … He came storming down the center aisle," but it was too late. The young R's had staged a coup. The enduring image of a decisive moment in the history of the Washington Legislature is O'Brien standing in the aisle glaring down at young Dan Evans, sitting stony-faced in the front row.

With his clean-cut image, Dan Evans was getting noticed around the state. In the spring of '63, after the Legislature adjourned, State Rep. Herb Hadley of Longview decided Dan ought to be governor and helped launch a "Draft Dan Evans Committee." Hadley had won election to the House in one of 1962's biggest upsets and was thinking big during a coffee hour with some of his Cowlitz County pals. Hadley was a real estate man and the descendant of one of Longview's first families - "a classic go-getter in the Jaycees mold," says ex-senator Sid Snyder of Long Beach, one of the Legislature's foremost historians.

That May, Dan was at work in his engineering office when an AP reporter called. "She says, 'What's this about a Draft Dan Evans Committee?' I just laughed and I said, 'Draft Dan Evans for what?' And she said, 'Well, governor, of course.' And I said, 'I don't know anything about it.' And I didn't. They didn't check with me; they just decided to do it. … Herb was an enthusiast. He wanted me to run, so those guys just thought, 'Well, we'll goose this thing along.' That got me to thinking about it enough that I got Slade, Joel Pritchard, Jim Dolliver, all of those guys, together and we met at my house."

Nancy was rolling her eyes. "He'd come home saying, 'Well, they're talking about this.' And I'd say, 'Oh God!' Initially I was very skeptical of the whole prospect. I just didn't think he had a chance. I had good reason to think that way and I was pregnant with number two, Mark. That was my focus."

Bucking the tide

It was shaping up to be a Democratic year, with Lyndon Johnson looking unassailable. John F. Kennedy had been murdered in Dallas, and Americans were likely disinclined to have three presidents in the space of 14 months. Johnson was also running against a Republican Party that was busy choosing up sides -

Goldwater conservatives vs. Rockefeller progressives. In Washington State, Democrat Al Rosellini was seeking a third term as governor. Conventional wisdom was that LBJ would have long coattails. Dan Evans barely registered a blip on the pollsters' radar. Nancy Evans told her husband something she would always say over the years whenever they were at a crossroads: "Look - you do what you think you ought to do, and I'll be there."

The other potential Republican candidates for governor included former congressman Tom Pelly, Congresswoman Catherine May, Seattle Mayor Gordon Clinton, well-known Seattle businessman Joe Gandy and Richard G. Christensen. Only 33, Christensen was a hard-charging Lutheran minister fresh from a narrow loss to U.S. Senator Warren G. Magnuson. The Republican Central Committee took a poll that June, Dan recalls, "and I was sixth out of six. I was dead last with, I think, four or five percent. And the only good news in the poll was that when they asked, 'Are these names familiar to you,' or some question like that, I was one percent less on who knew me than who would vote for me. And we said, 'Well, there's something in there!' "

Nancy with Danny and Mark in 1964. Evans family album Nancy with Danny and Mark in 1964. Evans family album.

Dan and Nancy's dear friend, State Rep. Joel Pritchard - a future congressman and lieutenant governor - was the strategy guy. He told Dan, "What you've got to do is invite 200 of your best friends to a 7 a.m. breakfast, ask them for money and see what happens." Dan said, "Well, geez, Joel, 7 o'clock - how about 7:30?" "Nope," said Pritchard. "Make it tough because you want to see who your friends really are." Some 140 Evans fans showed up with checkbooks. "We ended up with a second breakfast because I kept getting calls from people saying, 'Hey, Why didn't you invite me?' We asked them to pledge or raise $50 apiece." In short order, the fledgling campaign had a $12,000 war chest. Even Nancy was impressed - still dubious, but impressed nevertheless. Besides, Dan had made two things clear from the get-go: "I will not run a deficit. I don't want to owe anybody. And I won't contribute any of my own money to the campaign, mostly because I don't have any, and I don't believe in it anyhow."

Mark Lawrence Evans was born on September 20, 1963. Nancy was now the busy mother of two. Dan was an engineer by day, politician by night and weekend, although he always carefully blocked out family time. By January of 1964, despite its enthusiasm, the Evans campaign was flat broke and "just gasping." Then two members of the Weyerhaeuser family contributed a total of $5,000, "which was huge," Dan recalls. A second poll showed him up to 11 percent. Christensen's lead had shrunk but it was still commanding. "Gandy was below us but pretty close. I was disappointed because we had worked hard for six months. But Joel Pritchard said, 'No, no, no, don't worry. This kind of thing builds. It's going to come faster and faster as time goes on. We've got a lot better campaign organization than anybody else and a lot more volunteers.' "

No deals

By the spring of '64, the Evans campaign was gaining steam and the Gandy people wanted to cut a deal. "They tried to say, 'Well, Joel, he'll only run for one term. Why don't you have Dan run for lieutenant governor and then we'll turn it over to you?' " Pritchard said, "Nothin' doin'."

The state GOP Convention was at the University of Puget Sound in Tacoma. Cannily, Evans and Pritchard arranged with Don Moos, the permanent chairman of the convention, to have their demonstration last so they could gauge how all the other candidates had done. Gandy, the mover and shaker behind Seattle's Century 21 World's fair, had a brass band. Christensen had "women on the warpath" in Indian costumes.

"There was this huge Christiensen contingent," Nancy recalls. "And that's the part I hate about conventions - all that hoopla. I just don't like it. I can still remember standing outside the foyer of the center. Somebody on the stage was announcing, 'And now here we have Joe Gandy and Mrs. Gandy!' Laurene Gandy was just a lovely lady, and I can still see her, just putting her chin up saying to herself, 'OK, I'm going to do this!' And here was this lovely lady walking down amid the hoopla, hoopla, hoopla. Then they announced Dan, and it wasn't quite as much hoopla." But Dan told her there was a key difference: "The delegates were the ones that erupted into the aisles for us. Joel Pritchard had all the smarts." He'd ordered signs with "Evans" spelled out vertically so that when the delegates bobbed them up and down everyone could read what they said and they wouldn't get in anyone's way. "They had all these signs hidden down under the seats. When they started (waving them and hollering) it was so amazing! Nancy and I stood up there on the stage waving at friends as they went by. And I almost wept when I saw my father, who was the epitome of the old reticent engineer. He had a twinkle in his eye and there he was down on the floor with two signs - not one." Nancy says, "This quiet, dignified person was waving as wildly as he could. Dan had never seen his father doing anything like that." They both savored the moment.

Nancy's mother was watching the boys. Sadly, William Bell had died in 1962 at the age of 83. (His friends all called him by his middle name, Lawrence; the grandkids called him "Bompa.") But he knew Dan was going places and he was enormously proud of his son-in-law. Had he lived, Nancy says he would have been right next to Dan's dad - two old Republican engineers, whooping it up.

1964 State Republican Convention erupts with Evans signs. Washington State Library 1964 State Republican Convention erupts with Evans signs. Washington State Library.

On the road

"We did hundreds of hours of coffee hours," Dan says, "and having Nancy along was a huge asset to me." With a second child on the way they had invited her widowed mother to come over from Spokane and stay with them. Lilith Bell had said, "Well, OK, I will for just a couple of months." She lived with them for the next 20 years and enriched their lives enormously. With "Gom" as much more than a babysitter, Nancy could hit the campaign trail with enthusiasm, confident that the boys were in good hands.

Pin-Christensen

"We stormed out of (the convention) just really on a high," Dan says. In the next poll, Christensen was down to 42 percent and Evans was up to 29, leaving Gandy in the dust. Gandy's handlers made one last stab at cutting a deal before throwing in the towel. That made it a two-man race for the Republican nomination. Evans, ever the engineer, had been tracking his progress on a graph that he still has. Joel Pritchard kept saying, "Just watch - We're going to accelerate!" They calculated they were going to catch and pass Christensen around August 15th.

Dan Evans first election pin

No one knows for sure when it happened. In fact, with Pritchard a notable exception, Dan recalls everyone saying, "This is going to be a tight race. It's going to be right up to the end."

On Primary Election Day, Dan Evans crushed Christensen by 100,000 votes. Christensen, like Joe Gandy before him when the jig was up, conceded gracefully, pinning on a bright red Evans campaign button and declaring, "My task now is to join with this man and make him the next governor of this state…" The Rosellini camp, meantime, had tried to woo crossover votes in the primary with ads that said "Thinking Republicans CANNOT: 'Go with Goldwater,' 'Crusade with Christensen' … or 'Endure with Evans.' "

Over the next eight weeks, Joel Pritchard was the James Carville of the 1964 governor's race. They emphasized Evans' Eagle Scout image and characterized Rosellini as an old pol who'd had his turn. In Washington it was as if Dan Evans was the new frontier, with a platform dubbed a "Blueprint for Progress." "Let's get our state moving again," the Evans brochures and ads declared, promising "a new legislative program designed to end the drift and stagnation of the Rosellini administration."

The emerging Evans wing of the party - which would come to be called "Mainstream Republicans" - was taking care to not hitch its bandwagon to Goldwater's. To borrow a phrase from George W. Bush, the Arizona senator was "a divider, not a uniter." Goldwater had once wished out loud that he could just lob a nuclear missile "into the men's room of the Kremlin." The right-wing John Birch Society loved that line, and it was already suspicious of Dan Evans. With good reason. (In a famous speech to the Republican State Central Committee in the fall of 1965, Evans took stock of the GOP debacle he had managed to survive, declaring: "It is now time to discard hyphenated Republicanism. The Republican Party did not achieve greatness nor will it regain greatness by being the party of radicalism or of the lunatic fringe. Extremists of neither the Right nor the Left contribute to the strength of America or her political institutions. Both feed on fear, frustration, hate and hopelessness. … The John Birch Society and its frightened satellites … meet none of the tests and follow none of the traditions of the Republican Party.")

Always positive

Dan was the underdog but increasingly upbeat as the final two months evaporated in a blur of speeches, coffee hours and commercials. At mid-October the press reported that he was being outspent by more than 4 to 1. His expenditures since the primary were estimated at $100,000, while "ad agency observers" calculated that Rosellini had spent $450,000.

"He was always positive," Nancy says. "He was always very good at understanding what the numbers meant at that moment in time. So he wasn't often surprised about things." Pretty soon, "I had a feeling 'this may happen.' Then I think I began thinking, 'But what if it does? What will I do then? What's going to happen to us?'

"The one thing about that campaign that I loved was not just the people we met out in the communities; it was the people here in Seattle, our friends, and others who became really good, life-long friends. You could just feel they were working for Dan because they really wanted to be there. It was sort of like the Obama campaign: They really wanted to be a part of it. I'm not comparing Dan to Obama in any way, but this was really a mission that they were on - and they were having fun. And we had fun. It was so personal. We really were with the campaign workers a lot - and you just enjoy being together. …I have really good memories about that campaign."

Emmett Watson, the Seattle P-I's popular columnist, called Evans "a first-rate legislator … with a sincere abhorrence of political lunacy." Ross Cunningham of The Seattle Times said Dan represented "a combination of pragmatism and idealism," and The Raymond Herald & Advertiser, the leading paper in a solidly Democratic county, opined that "If anyone can restore harmony and respect between the executive and legislative branches of state government it is Evans."

Dan never wanted to be with a lot of people on election night - at least not before the ballots were all counted. "He wants to sit and watch that television and keep track of the numbers," Nancy says. "So conversation is not in there. And that has no exception. So my memory of Election Night 1964 is that we had a room at the Olympic Hotel with his family and my family, all the brothers and sisters and that sort of thing … And of course things were a little slower in counting the results in those days. But then when we knew he had won we went to the campaign office downtown."

Dan Evans had been elected Washington's 16th governor with 140,000 votes to spare. He was 39. Nancy was 31. They'd been married five years. The campaign headquarters was going bonkers. "I remember that Dan was talking with KING-TV up on the stage … And then the reporter had his microphone right in front of my mouth. But I couldn't hear his questions because it was so noisy. And I know I stood there looking like 'Duh.' I think I was actually in a bit of a daze. I just sort of went, 'What did you say?' … I felt so stupid standing up there. Then I was overwhelmed - in a good way."

Did she learn anything new about her husband by watching him on the campaign trail? - see him evolve? "Absolutely. … I really saw him grow with his understanding of issues in a broader sense. Being around the state so much more and talking to so many more people, getting different sides to every issue. I think he had a wonderful understanding of the major issues for our state, and he learned how to articulate them in front of people. …Environmentalism came very easily to Dan because of his old Boy Scout days," Nancy says. "Ever since he was a kid at Camp Parsons he had been hiking in the Olympics. To this day he takes a hike every summer in the Olympics or the Cascades. … But it was never defined in those days as the 'environment' and 'ecology,' and all those words that we are so accustomed to today. But when that whole movement came along, he was at the forefront because he felt so strongly about it."

She barely made it

Inauguration Day, January 13, 1965, dawned with Dan in Olympia, where the smoke was just clearing from a late-night battle over redistricting. Nancy was in Seattle, hustling the kids through their Cheerios and schlepping stuff into the station wagon. For a while the night before, the Republicans were threatening to swear in Dan at midnight to thwart any fast moves by the Democrats. Neither of them got much sleep. "I had to dismantle the crib that Mark slept in and put it in the trunk, and get everybody up and dressed and fed and ready to drive to Olympia to see Dan sworn in at noon."

Up and down the block, their neighbors had gathered to say goodbye. "It was wonderful. … So we say goodbye, and I'm putting my inaugural gown on top of everything, over the crib in the back. The boys are in the back seat." She glanced in the rear-view mirror as they headed up the hill and saw people waving their arms, yelling, jumping up and down. "The trunk door was open and everything is falling out, including my dress," which, fortunately, was in a plastic bag. Tire tracks on a ball gown would have been quite a fashion statement.

Nancy with Mark and Danny at the Governor's Mansion in 1965. Evans family album Nancy with Mark and Danny at the Governor's Mansion in 1965. Evans family album.

She stuffed everything back in and high-tailed it to Olympia, arriving about an hour before the ceremony. The Rosellinis had finished moving out just before she arrived. "I had arranged for some high school kids to be there at the mansion to help carry in suitcases and to do the crib." But they couldn't figure out how it went together, so Dan's father, another engineer, came to the rescue. "Then I had to get the kids something to eat! At least I was dressed. I had just worn whatever I was going to wear for the ceremony. But the kids, we had to get them dressed. Mark was just 16 months old, and we had to get him down for his nap, and then be over there at noon. Ah, it was amazing! But we made it."

In his inaugural address, the new governor declared, "We cannot be blind to the growing requirements of health and welfare. Nor can we be indifferent to the dangers of stifling competitive spirit. We cannot solve the problems of the present with the outworn dogmas of the past. We must be bold in charting our course, resolute in our determination, compassionate in our assessment of human needs, firm in our policies, just in our laws and efficient in our administration. … This administration is not frightened by the word 'liberal,' nor is it ashamed of the word 'conservative.' It does not believe that the words 'fiscal responsibility' are old fashioned, nor will it ever fear to spend money if money needs to be spent."

As usual, Nancy had read the speech in advance and felt it was both eloquent and "very timely," given the turbulent currents sweeping America. "I don't remember if I offered any suggestions. I sometimes did. But I was very proud of him and loved sitting in the audience and watching him deliver that speech, even though it was after a very long day."

In addition to multiple receptions, there had been a celebratory banquet before the Inaugural Ball. The governor and first lady came back to their new home to change into formal clothes. Mark was sound asleep, but 4-year-old Danny, still excited from the hubbub of the day, greeted them in his pajamas and bathrobe - together with a crew from KING-TV. Not realizing what she was getting into, Nancy had agreed weeks before to give KING's Chuck Herring an exclusive Inauguration Day interview. When the time came, however, she was feeling more like Lucy Arnaz than Jackie Kennedy. "I don't know why we ever even allowed it," Dan recalls, shaking his head at the memory of how hectic things were.

"So we're sitting in the living room being interviewed," Nancy says - she in her ball gown, Dan in his white tie and tails, with Danny between them, squirming with excitement at the prospect of being on TV. "Dan always remembers it so well because Chuck Herring said, 'And, Mrs. Evans, you are the youngest First Lady at 32.' And I say, 'I'm 31.' Dan always thought that was very funny." Then Herring said, "Can I have a tour?" And Nancy goes, "Sure Chuck, come with me!" Danny gleefully scampered ahead. "I'm trying to take his hand and be a mother. I can look back at it and smile, but at the time I was just thinking, 'Couldn't you just stand here and be a nice, quiet little boy for a few moments?' But, no, he was very excited in this new big house, with a new big playroom."

Dan says she pulled it off with aplomb. "She explained everything beautifully. 'Here is this silver service from the battlecruiser Olympia,' and all that sort of thing. After it was all over I said, 'Nancy, how did you know all of that stuff?' And she said, 'Well, I just listened when I'd come to receptions' " when he was in the Legislature. "When I look back on all that I think of what a miracle it really was. We had been married for about four years; we lived in a small little house in Laurelhurst. If we had more than six people for dinner you had to turn the table 90 degrees and move it out into the living room. And suddenly you're into a huge mansion with all of the formality and all of the people." Nancy clearly was up to the challenge. "She didn't miss a step."

The first couple did more hand-shaking than dancing at the Inaugural Ball. They were in a receiving line for more than three hours. Nancy's feet - and right hand - were aching. "There were so many people; we had so many friends, so many supporters. This was so exciting to them. I felt sorry for us, but worse for all those people who were getting pushed and shoved."

They returned to the mansion to find it packed with revelers. "So we finally went to bed at 4 in the morning - just exhausted because it had been a long day." Dan Evans left at 7 for his first day as governor. A bleary-eyed Nancy - who will tell you emphatically that she is not a morning person - was also up early to feed the boys, take an inventory of her new home and get ready for a new round of obligatory teas.

'Pretty, practical…"

Dan and Nancy try out the governor's chair for the first time. Washington State Archives Dan and Nancy try out the governor's chair for the first time. Washington State Archives.

In the beginning, the press invariably portrayed her as the little woman - a resourceful little woman, but the little woman nonetheless. She has "served as the flower in her husband's buttonhole at a score of important social functions," the AP noted. The Olympian's post-election headline on Nov. 11, 1964, was of the same genre: "State's New First Lady Pretty, Practical." But it did have the added advantage of being true. "The first is obvious," the story said. "The second was revealed when Nancy Evans said she hadn't made plans for moving to Olympia. 'We were so busy campaigning, and it seemed unnecessary to make plans we might never use,' she explained." But "Mrs. Daniel J. Evans has plenty of other attributes that helped her husband become the state's youngest governor … She has poise, a warm personality and an interest in politics."

Nancy at a Republican reception. Washington State Archives Nancy at a Republican reception.Washington State Archives.

With undertones of a write-up on a 4-H horse-judging competition, the story added that "she also had good feet and an excellent digestion. The feet, encased in needle-heeled shoes, traveled the long campaign trail beside those of her husband and she ate everything she was served. 'Well, sometimes I passed up the bread and potatoes at dinner,' she admitted, 'but I ate cookies and nuts at all those coffee hours. And I gained 15 pounds." She said she enjoyed campaigning because it took her to "every nook and cranny of this state," and although she "at first dreaded it," she quickly found it was fun, and everyone she met "was so friendly." The story concluded prophetically: "At 31, Nancy Evans may be the state's youngest first lady, but there will be few challenges she can't handle." As late as 1972 writers were still reducing her to a stereotype - the "pretty, pert wife who is the kind of mother very quick to wipe chocolate off the mouths of her three boys after an ice cream cone."

Settling in

Dan, Nancy, Danny, Mark and "Gom," together with enough animals to stock an ark, quickly discovered that their new 19-room home was old, with clanking radiators, a leaky roof and a mishmash of furniture, most of it pedestrian. The cold water faucets would often yield hot water, and vice versa. One bonus, Nancy quips, was that sometimes when you used the toilet you could "warm your bottom." On the other hand, if you plugged in a fan you could nearly electrocute Boots the cat.

The foyer of the Mansion in 1970. Washington State Archives The foyer of the Mansion in 1970. Washington State Archives.

Ethel Rosellini warned her that being the de facto CEO of the mansion wouldn't be all tea and roses. "Ethel told me about the night they were entertaining the crown prince of Norway or some such dignitary at a very big formal dinner party. It was being catered from Seattle, and when they plugged in the 50-cup coffee pots in the tiny kitchen the fuses blew and the lights went out." Oh, and another thing: There was one bathroom on the first floor. Nancy vividly recalls the day a busload of Seattle retirees pulled up in the driveway. "They all had to go to the bathroom - all 35 or 40 of them. I told them, 'There's one back there. That's it.' " Incredulous, they began to wander, looking for bathrooms. "These were elderly people. They had an urgent need. I understood that then and even

better now. And there was not a thing we could do."

One day, a 7-year-old from the neighborhood came over to play with Dan Jr. The boy's dad happened to be a carpet layer. The kid took note of the threadbare treads on the grand staircase. "Gee, Mrs. Evans, you need to get my father over here. Your carpets are really old!" To which Nancy replied, "You're absolutely right. I'd like to do that."

Mom leads a sing-a-long in 1967. Washington State Archives Mom leads a sing-a-long in 1967. Washington State Archives.

Every November, friends would come over to help address the thousands of Christmas cards the first family sent out. They'd set up tables in the ballroom and huddle around portable heaters. But the place was still so cold that they wore overcoats as they addressed envelopes with numb fingers.

Still, Dan says Nancy did "a spectacular job of making the wretchedly decrepit mansion look pretty good" for everyone from Cub Scouts to dignitaries - including Pearl Bailey, J.P. Patches and Victor Borge. Especially during holidays she worked her magic to make it a home that radiated warmth. The mansion was "filled with grandparents, sisters, brothers, cousins and what seemed like squadrons of young children," Dan says. They'd be tricycling down the halls; skidding across the polished ballroom floor in stocking feet; playing hide-and-seek and lining up shortest to tallest so dad could take the obligatory movies before the presents were opened. Then Nancy, the former music teacher, would play the piano to accompany Christmas carols.

"As I think back on those years," says Dan Jr., "what strikes me the most and maybe the greatest compliment I can pay to Mom is how 'normal' life was from my perspective. With three children of my own now, it is easier to relate my experiences to those of my parents. … It's truly amazing now to look back and recall how simple my life felt for how abnormal it could have been. My mom and dad both had a hand in that, but it was really my mother who made the mansion a home where three boys could and did feel right at home. We had birthday parties … had friends over to play, turned the Ballroom into an indoor basketball court, and the grand staircase was a great place to slide down the steps on sleds. I flew more than one model plane in flames from the second floor deck and played for hours in the woods behind the mansion."

Dan makes the cover of Time magazine. The Legacy Project Collection Dan makes the cover of Time magazine. The Legacy Project Collection.

Dad won a second term in 1968, after a turn on the national stage as keynoter for the Republican National Convention. Time magazine put the young governor on its cover, and Dan was in the running for a spot on the ticket with Nixon before - ever the contrarian - he endorsed Nelson Rockefeller. Many of his advisers were disappointed. Nancy was proud of him.

Their family had grown to three sons - Danny, 8, Mark, 5, and Bruce, 2. In addition to Peggy and Boots, there was a big tabby named Scamper, and kittens of course, plus bunnies, gerbils, grandmother's guppies and, at one time, a couple of turkeys who didn't last long, nor did one of the hapless gerbils, who got loose and provided a snack for the cats.

By the way, Nancy says the only people who ask her whether Bruce was born in the mansion are men. Women chortle at that naiveté, although if St. Peter Hospital had been located then where it is now - way across town - instead of just around the corner and up the hill, Bruce might have been history's second mansion baby. He arrived in a hurry.

The first - and to date only - mansion baby was Margaret Hay, born upstairs on Nov. 30, 1910. She was the sixth child of Gov. Marion Hay and his wife Lizzie. The Hays were the first first family to live in the new house. How it came to be built is a story that features another formidable first lady.

https://www.sos.wa.gov/legacy/stories/nancy-evans/page7.aspx

The 14,000-square-foot, red brick Georgian Revival house, though handsome, was constructed in a hurry at the wooded crest of Capitol Point in 1908 for the relatively munificent sum of $35,000. There'd been a severe national recession the year before, but the Northwest fared better than the rest of the country. This was the land of opportunity. Washington had been a state for only 19 years.

By the spring of 1908, Olympia was sprouting new buildings. The ballyhooed Alaska-Yukon-Pacific Exposition - Seattle's first world's fair— was set to open the next year. The whole state would be in the spotlight, and the governor would need a classy place to entertain visiting dignitaries, industrialists and investors. The cornerstone laying for "the mansion on the hill" drew a big crowd. Many local businesses had proclaimed a half-day holiday.

When work began on the grand new Capitol Campus in 1912, it was expected that the governor's "temporary" mansion would be torn down. The master plan

When work began on the grand new Capitol Campus in 1912, it was expected that the governor's "temporary" mansion would be torn down. The master plan envisioned the site being occupied by a twin to the neoclassical Insurance Building. But in the wake of never-ending debates over budget balancing and the priorities of government - some things never change - the mansion survived, which is not to say thrived.

The back of the Governor's Mansion in the 1950s. Washington State Archives The back of the Governor's Mansion in the 1950s. Washington State Archives.

Gov. Ernest Lister, a Democrat elected in 1912 in a photo-finish reminiscent of the Gregoire-Rossi election 92 years later, was so fed up with the state of the accommodations and the lack of privacy that he threatened to move out in 1913, actually did it in 1915 and lived intermittently in a downtown hotel again in 1917. Lister said the plumbing was bad, the wiring worse and the heating system a joke. The paltry budget the Legislature provided for maintenance and operations only ensured further decay, he added.

Lister had been in a running battle with the Republicans practically from Day One of his administration, hurling "denunciations right and left" as he delivered veto messages. When a contentious pork-barrel appropriations bill finally passed the House, the speaker dispatched the chief clerk and a senior member of the Roads Committee to deliver it to the governor. They ended up at the mansion just before midnight on March 7, 1913. "After repeated thunderous knocking on the front door, the two were confronted by Mrs. Lister, a determined lady with quick reflexes. When she opened the door," the clerk tossed the bill inside, "but like a skilled soccer player, the first lady drop-kicked it back across the porch" and the messengers fled into the night. The governor was livid, according to Gordon Newell, the capital city's leading historian. In his veto message the next day, Lister declared: "I want to say this right now - that if any gang of ruffians, hoodlums or window-tommies can go to the residence of the governor because it is a public building, any time of the day or night to compel him to be seen, I am ready to leave that residence and move to a private house where I can at least during the nights have a few hours of privacy that every public citizen is entitled to."

Adding insult to injury, the state auditor wanted to dock the governor $1,500 for overspending the Mansion Fund. In what became one of Nancy Evans' favorite quotes, Gov. Lister pronounced the mansion "a monument to the high cost of low bids." And some other things hadn't changed much either. Dan Evans says he never ceased to be amazed at Nancy's skill in managing the mansion "with the inadequate pittance the Legislature would appropriate for maintenance and operations."

"Out of place"

The Governor's Mansion had been targeted for removal as early as 1928, when some legislators argued that it was out of place on the new Capitol campus and the perfect site for a legislative office building, in keeping with one comprehensive plan.

A few blocks south, there's another mansion of note that plays a role in this story. Built in 1923 by pioneer Olympia banker and financier Clarence J. Lord, the beautiful stucco and tile house is the work of Olympia architect Joseph Wohleb. He created one of the city's grandest homes in the Spanish Colonial style then popular in California. In 1939, C.J. Lord's widow and daughter donated the mansion to the state. Legislation was passed accepting the mansion generally, but not necessarily, for a museum, and there was even speculation that it might be used as a governors' residence. The following year, the Olympia chapter of the Daughters of the Pioneers staged a rally that drew members from around the state. They demanded that the Legislature designate the Lord Mansion as the State Capitol Museum, and the lawmakers and governor threw in the towel. (Today, the Lord Mansion is the State Capital Museum and Outreach Center, part of the Washington State Historical Society.)

But there's another twist: In the early 1960s, it was suggested that the State Capitol Museum swap mansions with the state, giving the governor and his family a newer but better built mansion that boasted both historical and architectural significance. The notion was that by converting the Governor's Mansion into a museum, its proximity to the Capitol would attract thousands more visitors and finance a thorough renovation - a win-win. But nothing came of that.

A timely visitor

Evans family album Evans family album.

During the Rosellini administration, a bill was introduced to finance the long-planned legislative office building. That idea also went nowhere. The earthquake of 1965 raised structural concerns, and in 1966, a citizens' advisory committee recommended construction of a new mansion. A bond issue approved the previous year even included some funding. But Gov. Evans said he believed remodeling would be a "much sounder" plan and suggested that history-conscious citizens, organizations and businesses might donate funds or materials.

Nancy Evans was in full agreement, but she had her hands full doing the grocery shopping, preparing menus, arranging flowers, helping set tables, trying to find and, better yet, keep decent cooks for low wages. Her only other full-time helper was a housekeeper. Later, she had a part-time secretarial assistant. "I was extremely busy, what with the three children and all the things I had to oversee," Nancy recalls. "We had breakfast meetings, lunch meetings, dinner meetings, banquets, receptions and teas. I was just scurrying about, trying to keep up and thinking, 'What do I do tomorrow?!' "

That same year, 1966, Art McDonald, a popular KOMO-TV reporter, came to the door and asked to see the first lady. "In those days, you could come right to the front door of the Governor's Mansion," Nancy says. "I knew Art and he knew me, and we were chatting. Then he said, 'Well, I just wanted you to know that a member of the Capitol Committee (Lands Commissioner Bert Cole) has suggested that the mansion be torn down to make way for an office building,

because that was the original plan for the Capitol campus. Art said the idea was that 'a new modern, much more efficient mansion would be built somewhere else.' The Capitol Committee included the governor, the lieutenant governor and the commissioner of public lands. Without a moment's hesitation, I told Art, 'Absolutely not. We are a young state, and this is part of our history, and we need to retain it.'

There was no State Patrol guard post when the Evans moved in. Note the "Caution, Children at Play" sign to the right. Washington State Archives There was no State Patrol guard post when the Evans moved in. Note the "Caution, Children at Play" sign to the right. Washington State Archives.

"Art thanked me, excused himself and went right back over to the Capitol, where Dan was having a press conference. He said, 'Governor, I've just spoken to Mrs. Evans about the suggestion that the mansion be torn down. And she told me, 'Absolutely not. It's worth preserving.' What do you think?' And Dan said, 'That's what I think, too.' He's well trained!"

Dan, however, remembers waffling before getting his marching orders renewed. "Bert Cole was all in big favor of building a new mansion out on the point," he recalls, but Lieutenant Governor John Cherberg "wasn't sure quite what to do and neither was I. So it was kind of inconclusive that afternoon. After the (committee) meeting, we had a press conference and the press asked me my view. I said, 'Well, I don't know. Maybe a new mansion is OK.' I was kind of not willing to say too much about it because I didn't really know what the heck we ought to do. And I got home that night and the paper said, 'First Lady says, 'Save the mansion.' I asked Nancy, 'What the heck was all this about?' And she said, 'Well, I talked to a member of the press. They asked me and I told them.' … So I told her, 'Well, I guess that's our policy.' And then she was very good in saying why it needed to be saved, you know - 'It may not be old now but it will never be old if we (tear it down).' "

The governor emerged the next day fully girded for battle. Moreover, the cost of securing a site, constructing and furnishing a new mansion was estimated at upwards of a shocking $2 million. With Nancy taking the lead, the couple supported a "Save the Mansion" campaign launched by the Daughters of the Pioneers - good ladies to have on your side. They attracted a strong core of supporters.

https://www.sos.wa.gov/legacy/stories/nancy-evans/page8.aspx

Stop-gaps

The ballroom in the 1960s. Washington State Archives The ballroom in the 1960s. Washington State Archives.

After Dan won a second term, Nancy oversaw some repairs and renovations. But they were stop-gaps, literally and figuratively: The place was still cold in winter and stuffy in summer. Wind-whipped rain invariably led to leaks. One Christmas Day, as family and friends gathered to open presents, the governor was up on the rooftop trying to figure out why water was "just pouring into the ballroom." Further, the floorboards sagged; there was dry-rot in the porch and the wiring was a fright. The kitchen was too small for a family of six, let alone a place that entertained en masse.

"The mansion," Nancy told Sally Gene Mahoney of The Seattle Times on Inauguration Day 1969, "is an unhappy subject with me." The first lady lamented that when she called the caterer to make arrangements for a large pre-function, the woman "asked me if the kitchen had been fixed. When I told her it hadn't, she said, 'Oh no - your kitchen is the worst one I've ever worked in!' "

Privacy - or the lack of it - which sore-vexed Gov. Lister, was still a problem. The mansion was both a semi-public venue and a private residence, although the private part was sometimes lost on tourists in the era before a fence was installed, together with a State Patrol guardhouse at the foot of the winding driveway. Wearing shorts, Nancy turned the corner one summer's day to encounter a couple who thought they were in a museum. "When's the tour?" they inquired. She couldn't even leave the door open on a muggy day.

Mark had broken his leg while skiing. Looking on, at left, is Grandma "Gom" - Lilith Bell. Washington State Archives.

Still, the governor, first lady and grandma coped with it all and added touches that made the mansion a home. Dan, who had fond memories of what it was like to be an adventuresome little boy, loved woodworking. And he was, after all, a former civil engineer, so he built a tree house with his sons. "It was a beautiful tree house," Nancy says wistfully, "and it also turned out to be a very expensive tree house. There was an old maple tree outside the mansion that had an enormous trunk with a lovely fork about 10 feet up - just a logical place to put a tree house. Dan and the boys were out there every weekend for weeks building this thing. It had a trapdoor and a ladder. Mark, who was about 4 at the time, fell through the open trapdoor and cracked his head. And of course these things always happen on the weekend when the doctors aren't available. So we dashed, as usual, to the emergency room. Mark actually had some ensuing difficulties … and we had to go to Children's Hospital a few times. Happily, the difficulties went away with time. The boys spent a lot of time in that tree house. There were no small children in the mansion for several years after we left, and eventually the tree house was removed, but I was sorry to see it go."

As for the other emergency room trips, Mark broke his leg while skiing when he was 6, while Bruce suffered serious lacerations when he ran through a glass door when he was 3. He was playing "circus" with his brothers while visiting his Uncle Bill. A few months earlier, busy little Bruce locked himself in the

bathroom a few minutes before guests were set to arrive for a large dinner party at the mansion. Nancy says "Dan was out on the balcony checking windows to see if we could get in from there and I was frantically telling Bruce though the door, 'Turn the little button the other way like a good boy.' Just as the first guests rang the bell, he turned it and let himself out."

"My appreciation for my mother grows by the day as I drag my own kids through their childhood," says Bruce Evans. "They're 9, 6 and 4, the same number and similar spacing to my brothers and me. And to think she was doing all that while being thrust into the role of first lady at a young age. It's really remarkable to me."

"Are you coming back?

Having the mansion right across the street from his office meant that the governor could spend more time with his family, but he was still gone a lot. Nancy wrote an article about what it was like to be first lady and First Mommy. She said Dan always tried to have breakfast with his family. "Almost every morning" when he was about to leave for work, Mark would ask, "Are you going to the Capitol, Daddy?" When Dan said "Yes," he always knew the next question would be "Are you coming back, Daddy?" Nancy wrote that "it sounds a little fatalistic but I'm sure it must seem to Mark that his Daddy does not come back for many days, as often he does not return until long after the boys are in bed and sometimes, of course, he actually does not return for several days. And then I think, 'What a shame he can't spend more time with his father,' only to be caught short as I am preparing to go somewhere and Mark asks, 'Are you coming home, Mommy?' Don't tell me I'm gone that much, too!"

Mark Evans, who became the middle child with baby Bruce's arrival, had a knack for asking tough questions. Dan Jr., being oldest, dutifully took notes and pasted stuff in his scrapbook. When he was 10, he wrote an article for Jack and Jill magazine about what it was like to be the son of a governor. He said his folks assigned him and his brothers "certain jobs that have to be done regularly," noting that he had earned a five-speed bike by cleaning the garage and tetherball court and raising the flag. He liked Little League, Cub Scouts and playing with his brothers. Bruce, easy-going, funny and friendly, added spice to all their lives, Danny said. For instance, when the Apollo astronauts were poised to land on the Moon in the summer of 1969, his kid brother, then 3, was helping tend the family garden in the mansion's back yard. Bruce suddenly extracted a carrot, counted down - "Five-four-three-two-one-zero-blast off!"— then tossed it as high as he could.

Bruce balks at shaking hands with the vice-president. UPI, Washington State Archives Bruce balks at shaking hands with the vice-president. UPI, Washington State Archives.

In 1971, however, when Spiro Agnew visited the mansion, Bruce was uncharacteristically petulant. He refused to dress up and come downstairs with his brothers to meet the vice president of the United States. Nancy insisted, and the 4-year-old finally appeared in short pants and knee socks. With Mom bending over his shoulder, he shook hands with Agnew with downcast eyes, tears streaming down his face. Motorized Nikons whirred and newspapers all over the country published the photo. They say kids can sense things about people. Maybe Bruce knew the honored guest was a nattering nabob of hypocrisy. Agnew resigned in disgrace three years after their encounter, pleading no contest to a charge of income tax evasion. Bruce is now clerk for the U.S. Senate Appropriations Committee in Washington, D.C., and still gets teased about the photo.

As for teasing, Nancy recalls the time she was a substitute carrier on Mark's Olympian paper route and missed some porches. Mark, who was around 11, had a bad cold, or some such ailment, and mom sprang into action. Some customers had the effrontery to complain they'd been skipped or had soggy papers.

It seemed as if every day was a new adventure. One of Nancy's all-time favorite mansion moments came courtesy of a Cub Scout pack that arrived on Valentine's Day: "They walked in, presented me with a corsage, politely stood in line for their cookie, looked around, and, as they were leaving, each boy shook my hand like a gentleman and politely thanked me for a lovely time. But one little boy caught my heart when he pulled me down to him and said, 'The house is pretty, but I like your red dress better.' That was the nicest Valentine present I could have had."

"Gom" a Godsend

First Lady Bety Ford has tea with Dan, Nancy, two of the boys, and Grandma Lilith Bell, right. Evans family album First Lady Bety Ford has tea with Dan, Nancy, two of the boys, and Grandma Lilith Bell, right. Evans family album.

The nicest present the whole family ever had was grandma. Widowed when Nancy's father died in 1962, Mrs. Bell was persuaded to move into the mansion in 1965 to help Nancy settle in to her new role. But "Gom" quickly made friends in the community and enjoyed joining in the entertaining at the mansion, including having tea with Pat Nixon and Betty Ford. She became an expert on its history and could recite the provenance of its furnishings. She delighted in giving tours. Her presence was a Godsend for her daughter and the whole family. The boys adored her, and so did her son-in-law, who carefully listened to her advice, solicited or otherwise.

"Gom was the third pillar and a huge part of our childhood," says Bruce Evans. With grandma's help, "there was no feeling of absence on the part of either parent, and that's pretty remarkable given the responsibilities they had." His grandmother definitely "wasn't to be trifled with," Bruce says. "The only occasion when I had my mouth washed out with soap, around age 10, was when I said something I shouldn't have in her presence, and I'm pretty sure I never used that word around her again. … Her word was the word of God." After he ran through the plate glass window at his uncle's house, his grandmother urged him to stop crying and try to stay calm, "and I tried very hard because Gom wanted me to."

Dan and Nancy were rarely surprised by Lilith Bell's chutzpah. In the early 1970s, she often attended legislative sessions and hearings. Like many senior

Dan and Nancy were rarely surprised by Elith Bell's chutzpah. In the early 1970s, she often attended legislative sessions and hearings. Like many senior citizens, she needed a hearing aid, but found there were problems with the process and the product. "I learned what a sad need there was for standards," she told reporters. "My beauty operator had to have a license, but hearing aid salesmen did not. I began taking on legislators at cocktail parties at the mansion. When I went to the hearings, a lobbyist stopped me and said, 'Young lady, you're going to get arrested if you don't stop all that lobbying.' " Fat chance, Mrs. Bell said, but if it ever happened, she would "lobby against that, too. I believe in free speech!' "

"Dan didn't realize it at the time when he became governor," Nancy says, "but he quickly found out that there were several hundred commissions. There was the Mattress & Bedding Commission and there was a Hearing Aid Commission, so Dan said, 'Ah, I'll put Gom on that commission.' I thought he was really brave to put her on there. (But) I would run into people who were on the commission, and they said, 'Your mother is just a breath of fresh air. She comes in and tells it exactly like it is. And she tells the manufacturers what for.' "

Grandma's 80th birthday at the Mansion brought out all the Bells. Evans family album Grandma's 80th birthday at the Mansion brought out all the Bells. Evans family album.

The governor gleefully signed into law his mother-in-law's bill to regulate hearing aid sales. "She really was a dynamo on the commission because she was all for the consumer," he recalls. "She knew all the foibles and the problems and the difficulties and the costs. And so, boy, she really turned that commission upside down because she was fighting to get the cost down and the quality up. … She saw a need and acted. I thought it was just great. … 'Gom' was a wonderful help to us all and a steadying influence on the boys. She was always there. And a lot of times she was always there when we weren't. I don't know how we could have managed without her."

Nancy says, "Mother was a huge help and it really is what made it possible for me to not go crazy. And she was also very sensible. Any sensibility I have I learned from her. She was very practical, and when I wasn't around she tried to keep things orderly, as much as she could, with the kids. So she was a lifesaver." The touching thing, Nancy says proudly, is that when "Gom" got older, her three grandsons always took care of her.

Mrs. Bell's four children and a hundred friends and admirers gave her a surprise 80th birthday party at the mansion in 1972. She was going strong, eager as ever to try new things. "I cut off my long hair and went up in a blimp," she boasted.

That same year, her daughter acted on a plan they'd been mulling - a foundation to help preserve the Governor's Mansion "and stimulate interest" in the donation of antiques, artwork, table settings and historically relevant artifacts. One of the first lady's key goals was to establish and maintain some consistency in the style of the mansion's furnishings. Over the years, the Georgian Revival mansion had acquired a hodge-podge of drapes and furniture, much of it purchased out of pocket by former first ladies since the Legislature was perennially tight-fisted toward the mansion. In fact, when the Hays became the first tenants in 1908, Nancy says "the ladies of Olympia actually scurried around borrowing dishes and furniture" to help them set up housekeeping. Once unpacked, Governor Hay decided they would tap into the funds allocated by the Legislature for maintenance, operations and entertaining and issue a call for bids for enough furniture to furnish the place. He decreed that the bidding would be restricted to Washington state stores. The winner, with a bid of $15,000, was Frederick & Nelson, the pioneer Seattle department store. On the whole, given the tight budget, Lizzie Hay exhibited good taste. The stately grandfather clock on the staircase landing and the massive mahogany table, buffet and 18 chairs in the State Dining Room are among the survivors. However, "each family that moved in did things as money was allowed, and oftentimes not much money," Nancy says. "Every room was sort of different, except for the original furniture that was sort of late Victorian. There was no continuity to the décor."

Founding a foundation

Dan and Nancy at a press conference around the time the Legislature finally appropriated money to remodel the mansion. Evans family album Dan and Nancy at a press conference around the time the Legislature finally appropriated money to remodel the mansion. Evans family album.

In 1972, architects were still sniffing that the mansion was "not architecturally wonderful and not historically ancient." Gov. Evans shot back that it was "a lot more ancient than a new one would be." Nancy redoubled her efforts to save it. "But I knew that even if we won, the state was not going to buy the furnishings appropriate for a place like this. That's when I came up with the idea of forming a foundation that would do it." She invited influential, history-minded citizens from around the state to join the cause. Forty-seven women and five men met with her at the mansion on May 30, 1972. The first lady already had two important players on board. Jean Jongeward, one of Seattle's most sought-after interior designers, agreed to donate her services, while, in a real coup, Laurene Gandy accepted Nancy's invitation to head the foundation. Mrs. Gandy was a much-admired civic activist, together with her late husband, who spearheaded Seattle's Century 21 world's fair. Its success made the Gandys the toast of the town. In 1964, you'll recall, Joe Gandy was an early GOP

candidate for governor before withdrawing and lending his support to Dan Evans.

"I was so delighted when Laurene said yes," Nancy recalls, "because she was a wonderful, widely respected person and had great interest and knowledge of antiques. And my timing was impeccable because she had just lost her husband. The mansion was a new and interesting project for her to take on. I'm sure, however, that she had no idea of the amount of effort it was going to take, but she chaired the foundation for its first five formative years and did a wonderful job."

The foundation, anxious to avoid social minefields, quickly established a three-person Acceptance Committee. That simultaneously took the onus off Nancy Evans and protected the integrity of Jean Jongeward's master plan, which called for the acquisition of furnishings circa 1780-1830 to complement the design of the house. "Everywhere I went," Nancy recalls, "somebody would say, 'Well, I have Aunt Sophie's tablecloth that would be just perfect.' " From Enumclaw to Ephrata, there were countless Aunt Sophies with a vase, a chest of drawers or an allegedly priceless rug.

The sitting room, circa 1970s. Washington State Archives The sitting room, circa 1970s. Washington State Archives.

"Laurene Gandy and I traveled around the state with what I called our dog and pony show, talking to people about the foundation," Nancy says. "We asked Marie Edwards, who had been the buyer for the Old World Shop at Frederick & Nelson, to help us. The shop sold antique furniture, lamps and dishes, and Marie was extremely knowledgeable. She chaired the Acceptance Committee, so it was very easy for me and anyone else involved with the foundation to be able to politely say, 'I'm sorry. We have this committee that accepts things. I will refer this to them.' It was a very good decision to sort of depoliticize acquisitions and draw on the judgment of experts."

Jongeward and Edwards, with bargain-hunting savvy to match their exquisite taste, made the rounds of East Coast antique shops. They were pleasantly surprised when they found some choice American antiques. "They thought it was going to be primarily British or English pieces, and maybe a few French pieces," Nancy says. "So that was very exciting."

The foundation had received some donations, but it was far from well-heeled, especially in the early going, and often relied on timing and the kindness of enlightened strangers. "For the fireplace mantel, Jean and Marie had bought two little pieces with crystal drops. They arrived with one of the crystals missing, so we called a big antique store in New York." While mulling that request, the appraiser asked, " 'By the way, are you a poor foundation?' We said, 'Very, very poor.' And they said, 'Well, a woman has just come in who's a customer of ours from Connecticut, and she has this demilune (crescent moon-shaped) server that she would like to donate. But she wants it to go to a poor foundation.' We qualified! It's the lovely mahogany and bird's-eye maple inlaid server that sits just off the entry hall." The piece, circa 1800, is attributed to John Seymour, considered the greatest post-Revolutionary War furniture designer and craftsman in Boston.

Working with the experts and mobilizing the committees was "a wonderful learning experience for me," Nancy says. "I learned so much."

Four more years

Danny dances with his mom at the 1973 Inaugural Ball. Evans family album Danny dances with his mom at the 1973 Inaugural Ball. Evans family album.

"The main reason I didn't want to leave here is that I didn't want to pack," Nancy quipped to reporters after Dan won his bare-knuckle 1972 rematch with Al Rosellini. At mid-October, the resurgent Democrat had a 13-point lead in the polls. Then, in one turning point in the race, he referred to his successor as "Danny Boy" during a debate. The faux pas struck many as both patronizing of the younger man and disrespectful to the governor's office. Nancy was in the audience that Saturday morning at North Seattle Community College and says she knew immediately that Rosellini had made "a big mistake."

The Mansion Foundation, meantime, was proving to be a big success. Fundraisers were taking place all over the state by all manner of groups and organizations, Republican and Democratic women's groups, Rotary and Zonta clubs, guilds and sororities. The Boeing Company and other firms would make donations in the years to come.

Nancy asked Dan to make a guest appearance for the foundation's second-annual meeting in 1973. He had good news: The Legislature had at last appropriated $600,000 for remodeling and structural renovation of the mansion. It was going to have a new lease on life.

Renovation work got under way in the spring of 1974, after the Evans family took up temporary residence in a Colonial Revival home known as the Egbert-Ingham House. Built in 1914, it was at Columbia and 14th on the site now occupied by the Visitors' Center at the north entrance to the Capitol Campus.

Unfortunately, to paraphrase the first lady's father, the contractors discovered Surprises Equinoxia - expensive ones. "When they opened it up, they found out the mansion's beams were not footed properly," Nancy says. "The gravity of the house was pressing down, keeping them in place. They also found a number of pint whiskey bottles, so it's easy to understand why the house was having problems."

Much of the interior had to be virtually gutted. The final tab was nearly $2 million, but the outcome left few dissenters. The tired old mansion was transformed into a house that had all the modern conveniences - whether for banquets or family breakfasts - without compromising its integrity as a public

treasure. There was new wiring, new plumbing, a modern heating and air-conditioning system and a commercial-sized kitchen. Another sorely-needed public bathroom was added on the main floor, together with a private dining room and a family living room that Nancy loves. "It is a peaceful, quiet, lovely room" brightened by soft natural light from a big Palladian window that she suggested to the architects. She first admired the design in grand old homes and palaces she and Dan visited when they bummed around Europe as newlyweds. There's a smaller version in the house they built in Seattle when they finally retired from politics.

Renovation finally gets under way in the Mansion. Washington State Archives Renovation finally gets under way in the Mansion. Washington State Archives.

To complete the project, two new guest rooms were added on the second floor. In all, some 4,000 square feet of living space was added on the south side of the original structure, bringing the total to 18,000 square feet.

Meantime, the Mansion Foundation had been raising funds and tracking down furnishings and artwork for the public rooms. Through pluck and luck, Nancy and the other volunteers turned out to be persuasive fundraisers and world-class scroungers. "They had teas, lunches and dinners, train rides and picnics - all sorts of events all over the state," Nancy says. "And amazing pieces kept turning up. … When we moved back in September of 1974, it was truly exciting. The transformation was remarkable." That October was dubbed "Mansion Month," with fundraisers in 35 communities. More than $45,000 was raised. Through purchases and donations, the foundation had secured furnishings then valued at a total of $350,000. Today, the mansion collection easily tops $1 million, and the work goes on. Some of the greatest furniture-makers in American history, including Duncan Phyfe, Joseph Barry and Samuel McIntire, are featured. A magnificent portrait of George Washington by Rembrandt Peale, the American master of neoclassical portraiture, is a recent acquisition. "It's one of the finest in the country," Nancy notes, explaining that the foundation owns all of the furnishings in the mansion's original public rooms, as well as artwork and antiques in other public and private areas.

"What had once been a shabby home was now a really beautiful and even more historic building - a wonderful place where the governors and their families can enjoy life and entertain with a great feeling of satisfaction, proud to invite people from around the state and around the world," the former first lady says.

"What if?"

In 1976, Dan Evans likely had a good chance to become the state's first four-term governor, but he decided 12 years was long enough. Nancy was relieved. She too was ready for something new. Meantime, Gerald Ford, who had succeeded the disgraced Nixon, was looking for a running mate. With his squeaky-clean image and progressive record, Evans was on his short list. The Evans family was vacationing at a remote Montana cabin when the Secret Service arrived for a chat. That upped the ante, and Nancy's emotions were mixed: Pride, some anxiety and a dash of excitement, although she never allowed herself to get hung up on things beyond her control.

A few weeks later, Dan was asked to be a Ford delegate-hunter at the Kansas City Convention, where the president was facing a stiff challenge from Ronald Reagan. Dan's competitive juices kicked in, and the Evans brain trust - including legendary political operative C. Montgomery "Gummie" Johnson, Chief of Staff Bill Jacobs and Joel Pritchard, now a congressman - was doing its best to boost their guy onto the ticket. Ford's son Jack was also making it clear that Dan was dad's favorite.

Shelby Scates, the Seattle P-I's political reporter, called Jacobs to see if he could confirm a rumor that Secret Service phone links had been installed in the governor's suite, which would have been clear evidence that Dan was among the finalists. Jacobs said that was news to him. He cupped the phone and asked the governor and Bill Lathrop, his security man, if they knew anything. Both said nope, and Scates hung up disappointed. Dan was now intrigued. He dispatched Lathrop to check out the story. When the State Patrolman returned empty handed, Jacobs said, "I've got an idea. I'll be back!" He went to a pay phone, called the Holiday Inn where they were staying and in his best "Dragnet" imitation pretended to be a member of Ford's Secret Service detail. He asked the assistant manager to confirm that the phone links had been installed. "Yes, sir," the man said. "They're there." Then Jacobs said, "You're the one I was talking to when I was there?" "Yes sir." "Well, would you go over with me just where they're located?" "Well, sir, you told me that no matter who called on the phone, even you, not to discuss this." "Very good!" said Jacobs "But they are in place?" "Yes, sir, they are." Now, that's what we call great staff work.

In the end, Ford picked Kansas Senator Bob Dole. Dan told Nancy, "I know I'd be a better candidate than he is." It wasn't sour grapes. They were both wary of Dole's sarcastic tongue. The GOP ticket went on to lose narrowly to Jimmy Carter and Walter Mondale. "That was the one time," Jacobs says, "when I felt that the VP choice made a difference - that Mondale ran a good campaign, Dole a bad one."

Would Dan have taken the spot if it had been offered? "Sure," says Nancy. "The vice-presidency … would have been a wonderful experience. Absolutely." And what about the presidency? If Nixon had picked Dan instead of Spiro Agnew in 1968, her husband could have ended up in the Oval Office. He certainly wouldn't have been involved in Watergate, and he might have won in his own right in 1976. Did she ever think about that - "What if"? Well, "Not much." And if she had become first lady, would she always try to remember she was really Nancy Bell from Spokane? "No other choice," says Nancy. "That's who I am. But it's a danger. It's easy to get absorbed in whatever life you're doing without remembering how you got there - why you are there.

"When Dan was in the Senate and we moved to D.C. … there were a lot of social things going on all the time. It's very formal there. Women dress up all the time. I had to buy new clothes. … And there's a lot of deference paid to elected officials back there, to senators particularly. You go to a lot of embassies and on and on and on and on. So you can quickly forget who you are and where you come from. … My oldest sister - my wise older sister Barbara - came back to visit one time and she could see all of this going on. She said, 'Don't let yourself get so involved and forget who you are and why you're here.' And I said, 'Well, I

visit one time and she could see all of this going on. She said, 'Don't let yourself get so involved and forget who you are and why you're here.' And I said, 'Well, I hope I don't.' She said, 'Well, I can see that it would be easy for you to get that way.' So I tried very hard not to. ... It's just so insidious that you're not even aware that it's happening to you. You just expect, 'Of course I can do that. I can do whatever I want because my husband is a U.S. Senator.' So I was often surprised at some of the senators' wives who were there for a long time - some are still there - and what services they expected to have provided for them in the Capitol, for instance. And they were not the senators."

Packing up

In January of 1977, when it came time to leave the Governor's Mansion, Nancy and Dan sorted through their scrapbooks, packed with the flotsam of the past 12 years - name tags from trade missions, menus, birthday cards, telegrams and notes from famous people, including Nixon, who with typical duplicity assured Dan, "Your friendship means a great deal." And from not-so-famous people thanking Dan for his stewardship of the state. "Whenever I am tempted to dismiss all politicians as crooks," a Seattle woman wrote, "you restore my faith in the system." Page after page of snapshots of the family skiing, hiking, swimming; a series of Polaroids of Dan shaving off his much-debated beard in silly stages - Fu Manchu, Pecos Bill, Hitler. So many memories. And just when the place was fixed up, it was time to leave.

Dan and Nancy's 1972 Christmas card. Grandma "Gom" thought it looked bad that the boy's jeans were patched. But Nancy said it showed they were real boys. The Legacy Project collection Dan and Nancy's 1972 Christmas card. Grandma "Gom" thought it looked bad that the boy's jeans were patched. But Nancy said it showed they were real boys. The Legacy Project collection.

"It's like having a baby," Nancy says. "You nurture a child and you raise it, and then you send it out into the world with no idea of what they're going to do. So when we left the Governor's Mansion we had deeply mixed emotions. It had been our home for 12 happy years - Dan, the three boys, my mother and all those pets."

Dr. Ned Brockenbrough and the First Lady prepare to plant the "Nancy Evans Rhododendron." Evans family album Dr. Ned Brockenbrough and the First Lady prepare to plant the "Nancy Evans Rhododendron." Evans family album.

People kept asking her, "Won't you be glad to get back to Seattle?" "And I said, 'Well, we're really happy where we are. We've really enjoyed Olympia. People think Olympia is terribly remote and provincial... But there's an ease of life here that I don't think you find in a larger city. There are things happening here and it's going to be very hard to leave Olympia." Nancy Evans' work in promoting cultural events during her years as first lady played a key role in making the capital a livelier city.

Often unmentioned is the fact Dan Evans prided himself on having a close-knit administration and he expected all of the key players - aides and departmental directors - to live in Olympia. "They became part of the community," says Jacobs, "and Nancy took an active role in the directors' wives club, which got together regularly at the mansion and did things under her leadership."

Since so many things bloom under Nancy's touch, friends and admirers gave her a unique going-away present: a new hybrid rhododendron, named in her honor. The rhodie, after all, is Washington's state flower. The Nancy Evans Rhododendron has orange-red buds that open to gorgeous amber yellow flowers in early May. It was created by Dr. Ned Brockenbrough, a Seattle surgeon who in the 1960s got hooked on the art and science of cross-breeding rhodies.

What next?

Dan was entertaining job offers, but most would have forced them to leave the Northwest. "My general response," the governor said in the summer of 1976, "has been 'Call me when you move your headquarters to Seattle.' " He added that a college or university presidency would be very appealing.

When Dixy Lee Ray moved into the mansion, Dan and Nancy treated the kids and Grandma to a vacation in Europe. When they returned it was to Olympia. Dan became the second president of The Evergreen State College, a job where he would need all of his political and diplomatic skills to ensure the survival of the controversial liberal arts school. Governor Ray and conservative lawmakers viewed Evergreen as an enclave of lefty professors and hippie kids with shaggy dogs.

The family moved into the president's home on Budd Inlet. It was nothing like a mansion, which was a relief in many ways, and it featured a spectacular view.

Nancy had a strong liberal arts background and real-world experience as an overseer at Whitman. She was in the trenches with her husband, lobbying to improve Evergreen's image and protect its funding. Dan Jr. was in high school, Mark in junior high and Bruce a fifth grader, so she was a busy mom, still active in cultural and philanthropic affairs - and disturbed by reports that Dixy Lee Ray's beloved poodle, Jacques, was peeing all over the mansion.

Dan burnished his image with the students and faculty when he took up famed mountain climber Willi Unsoeld's challenge to rappel down the clock tower on campus. They were happy years for Dan and Nancy, and they shored up Evergreen's reputation.

The Evans family on the deck at the home of the president of The Evergreen State College. Evans family album The Evans family on the deck at the home of the president of The Evergreen State College. Evans family album.

Soon, the oldest Evans boys had driver's licenses, which meant Nancy wasn't logging as many miles as taxi driver. She gave them the room to make mistakes, but kept an eye on everything. Mark says his parents "were admirably restrained," but had different styles. "Mom was the disciplinarian in some ways but never in a heavy handed fashion," he says, offering this cautionary true tale: "When I was in High School, some friends and I borrowed my parents' Volvo station wagon to go to a basketball game. On the way home, the normal road we would have turned onto was blocked off due to flooding. One of my friends suggested it would be great to drive through the water and throw up a huge spray. Being the responsible middle child, I of course demurred - for 20 seconds. I hit the gas, and boy did we ever throw a huge spray from either side of the car. Then a big spray came over the hood and the car stopped." After a moment of stunned silence, one of his friends opened a door. Water surged in, and the friend belatedly said, "Don't open the doors!" Mark rolled down a window, jumped out and landed in waist deep water. The boys finally managed to push the car back onto dry pavement.

"When I got home later that evening after wringing out the car at a friend's house, I heard my father's voice asking me to come into their room. They were both in bed. Dad looked like he had been doing the crossword with the TV on in the background, while Mom had fallen asleep. Dad lectured me briefly on staying out too late, then asked me to turn off the TV. I had been standing in the shadows because my pants were wet. Now I had to cross the room and hope he wouldn't notice. I strode over to the TV, turned it off and started to leave the room, thinking to myself, 'Thank goodness, he didn't notice anything.' But as I was leaving the room, Mom, whose eyes had never opened - or so I thought - said, 'Why are your pants wet?' That story to me captures my Mom. Even when you don't think she's looking, she's got her eyes out for her boys."

Scoop's successor

In 1983, U.S. Senator Henry M. "Scoop" Jackson died unexpectedly of a heart attack. Dan Jr. was about to graduate from Whitman, while his brothers were headed East - Mark to Williams College and Bruce to Yale. In fact, Dan and Nancy had just dropped off Bruce at SeaTac. It was a gorgeous late August afternoon. "The Evergreen president's house had a deck out in back overlooking the bay and Mt. Rainier. We were having a drink, sitting out there just talking," Nancy recalls. "And I remember I said, 'You know, now that the boys are gone … are we still going to like each other?' And Dan said, 'Well, of course.' And I said, 'I don't know, it just seems strange. What are we going to do?' It was this deep discussion. … Finally I said, 'Well, I've got to go fix dinner.' And Dan says, 'Why?' And I laughed and said, 'Well, I don't know!' So I think I sat back down and we had another drink. We went to bed and at about 11 or midnight, Dan's brother Roger called. He said, 'Have you heard the news?' Scoop Jackson had died. We had not heard the news, and the next morning, right after these two boys had gone off to school and we had talked about 'What do we do now?' the phone started ringing. The timing of everything was incredible."

Over the years, Dan had weighed running for the Senate. "We thought Maggie and Scoop were going to be there forever so why think about it?" Nancy recalls. Besides, "he just liked being governor" and being president of the college had turned out to be interesting as well. "He just didn't think that was something he wanted to do."

Over the next several days, they mulled. Dan talked with Senator Slade Gorton, his old comrade. Gorton encouraged him to seek the appointment. Secretary of State Ralph Munro, a trusted friend and former aide, prodded him to call Governor John Spellman, who would get to fill the vacancy. Dan decided "the polite thing to do" would be to talk it over with Spellman, but he was a conflicted candidate. Just before he left for the meeting with the governor, Nancy recalls, "he was walking down the hall shaking his head."

"I said, 'I'm going to tell the governor 'No.' I just don't want to do this,' " Dan recalls. "And she said, 'Look, you do what you want to do, and I'll be there. It'll be great. Whatever you do is fine.' "

On the ride from Cooper Point to the Governor's Mansion, he changed his mind. All over the radio was the news of a Korean airliner being shot down when it strayed into prohibited Soviet Union airspace. All 269 people aboard perished. It was perhaps the most dangerous moment since the Cuban Missile Crisis. "Good God," Dan said to himself, "how can you not want to really get involved in resolving (things like that)? With this many problems and the challenges that we're facing you can't just back away from that." He and the governor had breakfast in the new private dining room the Spellmans were enjoying, thanks to Nancy. "I told the governor, 'You do whatever you want and I'll be very happy. But, if you think that I'm the right appointment, I'd be proud to serve.' " Spellman said he was proud to appoint Daniel J. Evans to the United States Senate.

"It was a very hard time," Nancy says. "One of the hardest times in our lives …because then he had to run for election in two months" (if he wanted to serve out the last five years of Jackson's Senate term.)

Nancy and the boys attended the swearing in, then Nancy returned alone. "Dan had to fly back there every week to learn how to be a senator. Fly home on the weekends, organize and put together a campaign, raise money. … campaign out here and then go back and do his work back there."

Pressed into service was their trusted friend Bill Jacobs, who was in D.C. on a special assignment with the U.S. Department of Labor.

Dan defeated Seattle Congressman Mike Lowry, who went on to become governor and a partner with Evans in a coalition to protect forests and wildlife. While some might conclude they're the strangest of political bedfellows - the voluble liberal Democrat and the cerebral Republican engineer— their friendship is another example of Evans' bridge-building style. It's Nancy's style, too, and she says of Lowry "He's a love - he really is."

A frustrating job

U.S. Senator Dan Evans with his family at the National Capitol in the 1980s. Evans family album U.S. Senator Dan Evans with his family at the National Capitol in the 1980s. Evans family album.

Slade Gorton, Dan's old comrade from their days in the state Legislature, loved the Senate, but Evans was frustrated from the beginning. Dan's staff was "wonderful," Nancy says, thanks in large part to Jacobs' skill as a recruiter and organizer. But seniority - or the lack of same - permeated practically everything in the Senate.

Things were better when Nancy finally found them a tiny but charming old house not far from the Hill. Dan also landed a spot on the Foreign Relations Committee, so they met dozens of visiting dignitaries, and took a number of trips together. Jordan is the most memorable. Before King Hussein arrived for a luncheon, Nancy demonstrated her diplomatic skills and big sister wisdom. Dan's assistant, a young woman named Chris Dawson, was told she had to remain with the women while the men discussed serious issues. "She was a bright, independent, single lady and furious," Nancy recalls. "She almost turned red right there. … I could see that Chris was about ready to say something, so I went over, and I think I whispered, 'Just come quietly with me.' We went to this tiny room off the entry and sat there with these Jordanian ladies. They were very nice, but we had nothing in common because all they wanted to talk about was their trips to London and Paris, and shopping. Chris was sitting there seething. And I was sitting there trying to look interested."

Dan was impressed by the way Nancy defused the situation: "Boy, she caught it so early that I don't think anybody else even ever knew. … Nancy just nipped that one right in the bud. We had a more official meeting afterwards, which Chris was part of. So it all worked out. … And then of course during the lunch I could hardly get a word in edgewise with the king because he was talking with Nancy the whole time."

With her deft touch and lively sense of humor, Jacobs says Nancy played a key role in keeping Dan's Senate staff revved up. They put in some long hours, but the boss's wife was a familiar face, whether for work or play. "One of the things that brought us together," the chief of staff says, "was that we played together, too, and Nancy played with us." When there was a pizza party at someone's apartment, she'd just as soon be there as at some swanky reception on the Hill.

By 1987, however, Dan had had enough of the other Washington. They were coming home. "I've lived through five years of bickering and protracted paralysis. Five years is enough," he said. "I just can't face another six years of frustrating gridlock."

Senator Strom Thurmond, the living fossil from South Carolina, once asked Nancy, "Well, Mrs. Evans, does Dan prefer being a governor or does he prefer being a senator?" Nancy replied that Dan preferred being a governor "because of the ability to set the agenda and organize things a bit more the way you would like to have them." Thurmond patted her on the behind and said, "Yeah, but the Senate is where the power is!" True enough, if you'd been around since the Eisenhower administration. Jacobs offers this perspective: "I think it's important for people to understand that Dan and Nancy valued that experience in Washington, D.C., and they both worked hard at it. All governors who wind up in the U.S. Senate are frustrated at first because they don't have the executive power they did. But the main reason he decided to not stay in the Senate is that if he ran for re-election and got elected, in essence that would be where he was spending the rest of his life."

Exactly, says Nancy. Dan did hate the inertia in the Senate, "but it wasn't just that." They were both getting older. They enjoyed the museums, monuments and battlefields, met many fascinating people, but it never felt like home. They yearned for the trees, the mountains, Puget Sound on a spring day with wind in the sails.

But first they spent a stimulating semester at Harvard, where Dan was a visiting fellow in the Kennedy Institute of Government. Nancy audited classes to her heart's content, including one devoted to Beethoven, another on art history and yet another on Southern female authors. "Dan would go off to his classes, and I would put on my boots, my wool coat, my scarf, my gloves and my hat. I'd pick up my books and off I would trudge - a college student all over

classes, and I would put on my boots, my wool coat, my scarf, my gloves and my hat. I'd pick up my books and off I would trudge - a college student all over again. It was fun!"

"Retired"?

Settling in back home, they built a dream house not far from the park bench where Dan proposed. You would be hard pressed to find two busier, ostensibly retired people. She became a trustee at Whitman, he a regent at the UW. She found herself knee deep all over again in the Seattle Symphony Board, plus KCTS and the Friends of Cancer Lifeline. She was surprised and deeply honored when the Nancy Bell Evans Center on Nonprofits & Philanthropy was established in 2004 as an adjunct to the Daniel J. Evans School of Public Affairs at the UW. One of the lessons of her Depression-era childhood was that "even if you didn't have much money, you could still donate your time and in any case you had an obligation to care." The Northwest Parkinson's Foundation at Evergreen Hospital at Kirkland is also close to their hearts because family members and friends have fought the incurable neurological disease.

As for cancer, it's one thing to battle it yourself, Nancy says, and quite another to see a precious grandchild desperately ill. Eloise Evans - the daughter of Dan Jr. and his wife Celia - began her harrowing bout with rhabdomyosarcoma two months before her fourth birthday. It is a cautionary tale with a happy ending. Eloise is 14 now and a competitive swimmer, her grandmother notes with pride, thanks to Seattle's Children's Hospital and a world-class oncologist named Doug Hawkins. At first, doctors thought it might be an ear infection, then tonsillitis. Nancy's daughter-in-law instinctively knew it was something more serious, so she scooped up her child and took her to the ER at Children's. "They found a mass the size of a tennis ball under her brain," Nancy recalls, still shaking her head at the close call. It was inoperable. Thirteen rounds of chemo and six weeks of radiation saved Eloise's life. Grandma and Grandpa were there every inch of the way, together with a platoon of Dan and Celia's friends, who cooked and delivered meals and offered unwavering support. Eloise's two siblings frequently lived with Dan and Nancy while their parents took turns sleeping in her hospital room. Sometimes Eloise asked her grandpa to spend the night with her at the hospital - "a rare honor" and privilege, Nancy says.

"The tumor was so fast growing. If it had slid for even a few weeks, who knows what would have happened?" Nancy says, "So I give full credit to Celia for not waiting. The thing I so often tell young mothers is, 'Listen to your children. Don't necessarily listen to the doctors because you know your child better than anybody. Follow through on your instincts.'"

The Foundation

Nancy has, of course, kept up with the Governor's Mansion Foundation. Even though the foundation had been carefully established as the legal guardian of the mansion's public rooms and furnishings, Nancy says she once worried that problems might crop up in the years to come - personality clashes between the board and first families or dust-ups with the Legislature over appropriations for maintenance. She wondered whether her successors would chafe at the restrictions and want to change things to suit their own individual styles. Over the years, in fact, she says she has made pro forma apologies to most of her successors, including Mike Gregoire, the state's first "first gentleman," for tying their hands. "When we set up the foundation, we stipulated that the governor's wife cannot do any of the decorating in the public rooms, so that the master plan would be kept intact. But they've all been very kind and said, 'We were all very happy not to have that responsibility.' It's been quite wonderful, the way they've all gotten along together."

That succeeding first families, the foundation and the state have happily coexisted as caretakers of a public trust is testimony to Nancy Evans' deft ability to bring people together to achieve good things - and have fun doing it. Like a proud parent, she is endlessly delighted with the work of the foundation. "They've continued to do a marvelous job."

Shelley Carr, the president of the foundation, says Nancy "is one very gracious, genuine, amazing woman. She has the ability to make one feel so at ease - like a loving aunt. I remember calling her a few months ago with a last-minute request for photos for a book on the families who had lived in the Governor's Mansion. She was packing to leave town for a few months, but she interrupted what she was doing, went to Dan's office, selected a number of delightful photos and made sure they were promptly mailed to me. That's going way beyond the call.

"Not only do we have Nancy to thank for saving the Governor's Mansion from demolition, the idea of setting up a foundation for the maintenance of the public rooms was ingenious. Here she was a young mother with a zillion things to attend to, and she researches how best to set up the foundation for the preservation of this oldest building on the capital campus. We are so lucky she was our First Lady. And, she's still a great supporter," Carr says.

Dan Evans Jr. says the work his mother did to preserve "such an important icon for all Washingtonians was a remarkable feat. … She worked tirelessly to rebuild and redecorate, and the result is stunning. I am sure there are many visitors to the mansion today who just assume that it always looked so beautiful."

Best friends

Nancy in 2009 with a memento from the 1972 campaign when Al Rosellini called her husband "Danny Boy." John C. Hughes for The Legacy Project Nancy in 2009 with a memento from the 1972 campaign when Al Rosellini called her husband "Danny Boy." John C. Hughes for The Legacy Project.

Bill Jacobs, who met Nancy during Dan's first campaign for governor, says he realized early on that although she was only 31, she was a remarkable blend of charm and intelligence. They became good friends, especially when they ended up a long way from home in D.C. When Dan was busy with a hearing or other Senate duties, they'd go to dinner or the movies, and "sometimes I would escort her to an important function. I was always flattered to do that. I would say to Dan, 'Well we've spent most of the weekend together,' and he would go 'Really?' (almost yawning) as if to say, 'I'm not worried.' Which, kidding aside, is another insight into the trust these people had, one with the other.

"I can't imagine how difficult it must be for an elected official not to have the support and camaraderie and the wisdom of their spouse. But Dan was especially blessed. Jim Dolliver used to say that Dan's best friend - besides being his wife - was Nancy. They had great rapport and great understanding, but they would argue a lot, too. So it wasn't all harmony. That's just the way they related sometimes. They could tell one another the truth about how they felt," the former chief of staff adds.

"I also remember Jim saying early on that a governor has three responsibilities: You're the chief executive of the state; you're the First Family and you're the leader of your party. Nancy played a significant role in all three of those responsibilities. She traveled with him; they talked together; she gave advice - good advice," political and otherwise. Jacobs adds that Nancy also deserves credit for helping Dan energize the progressive wing of the Republican Party in Washington State. "They kept it a moderate party," he says. "It's no wonder the conservatives were angry with them because (they were so effective). Having said that, they're both much more loyal Republicans than the Republican Party gives them credit for. … As a team, I have never seen anything in political life like the two of them."

He says it has occurred to him lately that Nancy Evans and Hillary Clinton have several things in common, notably that they are both exceptionally smart and never hesitated to offer advice to their spouses. (Dan Evans, one could argue, was a way better listener than Bill Clinton.) Jacobs believes that "Nancy could have had her own political career, had she chosen to, because she had the ability and the popularity."

Most of all, Evans' former chief of staff adds, "They both took that role of being 'first citizen' very seriously. They knew people were looking to them - that people judged them… And they led exemplary lives as role models. Both of them are comfortable in their own skin. They know who they are - always have - and that says a lot about what kind of people they are."

Counting blessings

The Evans family, including sons, daughters-in-law and grandkids, gather at Sun Valley to celebrate Dan's 80th birthday in 2005. Evans family album The Evans family, including sons, daughters-in-law and grandkids, gather at Sun Valley to celebrate Dan's 80th birthday in 2005. Evans family album.

In a 1974 interview, the Associated Press asked Nancy to assess her "public image." After a long pause, she replied, "I'm not sure I have one. I'm probably seen as a shadow of my husband, I'm sorry to say. I don't like to be. I looked at a press release the other day that said, 'Nancy Evans, wife of Gov. Dan Evans,' and thought, 'Gee, why did they have to say 'wife of Gov. Dan Evans'? all the while knowing why they have to."

That doesn't happen much any more.

The Evans boys are happily married, have good jobs and three children apiece, which adds up to nine grandchildren to dote on - although most of them are farther away than they'd like. Dan keeps working on his autobiography, but Nancy and their friends think it's taking way too long. He admits that every time he uncovers an interesting old news story or editorial about the Evans era, he gets so fascinated that he forgets he's supposed to be writing. As an author, he really is "Old Gluefoot."

They count their blessings. They're enjoying good health and lots of stimulating activities. They're still very much in love. To observe their 50th anniversary, they recreated their trip to Carmel - without the big-finned Plymouth, but with a corkscrew, to be sure. Looking back at an eventful life, Nancy says she dearly loved her father, but it was mother who knew best when she said, "You can do whatever you want to do; you just have to be ready to do it, and say yes."

John C. Hughes, The Legacy Project, 2009

Key sources

HistoryLink.org, the indispensable encyclopedia of Northwest history, features an excellent 2004 essay on Dan and Nancy Evans by Cassandra Tate.

The Washington Governor's Mansion Foundation Web site offers a comprehensive history of the mansion and the foundation, as well as a photo gallery, tour information, newsletters and information on how to make a donation.

The 2009 Whitman College Alumni award

Miriam L. Bausch of Olympia, a tireless member of the Mansion Foundation, conducted an important interview with Nancy Evans on July 15, 2008, in connection with the mansion's centennial, with transcription by Teresa Bergen.

For a short biography of Nancy Evans and many other first ladies of the State of Washington, plus an historical overview of the mansion, read "First Families" by Mary Lou Hanify. Kendall/Hunt Publishing Co., 1988, ISBN 0840345968

For an entertaining, irreverent history of Washington's capital city and 120 years of state politics, see "Rogues, Buffoons & Statesmen" by Gordon Newell, Superior Publishing Co., Seattle, 1975, ISBN 0-87564-106-7

For more on the colorful career of Speaker John L. O'Brien, who was ousted by the Evans forces in 1963, see Daniel Jack Chasan's "Speaker of the House," University of Washington Press, 1990, ISBN 0-295-96848-6.

For more on the history of the mansion, see "The Governor's Mansion Centennial," by Gerry L. Alexander, chief justice of the Washington Supreme Court, in the winter 2008-09 issue of Columbia, the magazine of Northwest history.

The interior designer who helped Nancy transform the mansion died in 2000 at the age of 83. The Seattle Times said, "Jean Jongeward, the elegant designer whom clients and colleagues called 'Seattle's queen of design,' built a national reputation for originality, patronage of local artists and decades of influence in Northwest homes and businesses. Largely self-taught, with a background in accessorizing model rooms for the old Frederick & Nelson store, she worked with top regional architects and helped establish the Northwest style."

"Voices of the Mansion," which includes oral histories on the history of the Governor's Mansion, was published by the Governor's Mansion Foundation, with a grant from the Women's History Consortium, $10, available at the mansion on tour days.

"A Public Mansion, A Private Home," partially funded by the Colonial Dames of Washington, $10, also available at the mansion on tour days.

death within six months.

Initiative 119 would clarify and expand the Legislature's expressed intent, clearly set forth in the present law.

Further, Initiative 119 would add to the present law a new medical procedure, aid-in-dying, available voluntarily to conscious, mentally competent adults who are terminally ill. Aid-in-dying lies at the very heart of "broad personal rights of privacy and dignity."

Public opinion surveys show majority support for these amendments. The Legislature should enact Initiative 119. If it fails to do so, voters will decide the matter.

Mary Hood EVANS January 2, 1926 - September 30, 2004 Mary Hood Evans, wife of the Rev. Marvin D. Evans passed away on September 30, 2004 after a long illness. She was born in Richmond, VA, the daughter of Kent W. Hood and Annie Collins Hood. A graduate of Thomas Jefferson High School, she earned a B.A. degree from Duke University and, later, an M.S.W. from the New York School of Social Work. After graduation from Duke she returned to Richmond and worked for the Children's Aid Society. On August 8, 1953, she married Marvin D. Evans and they had two children: Kent Hood Evans (1955 - 1972) and David Marvin Evans (Alexis Johanson) of Keyport, WA. While in Richmond she was active in many organizations including Ginter Park Presbyterian Church, the League of Woman Voters, the Richmond Committee to Save the Public Schools and the First Unitarian Church. Following her husband's ordination as a Unitarian Universalist minister in 1963, the family moved to Victoria, British

Columbia, Canada, and then to Seattle in 1967. Residing in Seattle for more then thirty-five years, Mary was active in religious, civic, political and social service organizations. She served on various boards and committees, always with a deep and abiding commitment to the inherent worth and dignity of every person and justice, equity and compassion in human relationships. Many community leaders tapped her wide-ranging pool of knowledge and sought her wise counsel and advice. She was a long-time dedicated member of University Unitarian Church of Seattle and embodied her Unitarian Universalist Principles and Purposes in her life and work. We wish to express our grateful appreciation to Sundance Rogers, MD of the Virginia Mason Clinic at Winslow, and the staffs of the Wyatt House Retirement Center on Bainbridge Island and Hospice of Kitsap County. A Celebration of Her Life will be held on Sunday, October 31 at 4:00 p.m. at University Unitarian Church, 6556 35th Ave. NE with the Revs. John M. Luopa and William H. Houff officiating. Memorial contributions are suggested to the Kent H. Evans Scholarship Fund, Lakeside School, 14050 First Avenue NE, Seattle, WA 98125. This fund, established in 1973, makes it possible for young people of limited financial means to further their education in a rigorous academic environment.

[HT0099][GDrive]

"There will be a flood of persons seeking aid in dying, coming from all over the United States and Canada, since only in Washington will their desire to end their lives be honored without fear of prosecution," wrote Dr. Albert R. Jonsen, chairman of the ethics department at the University of Washington's medical school, in a recent issue of the magazine Commonweal.

But the Rev. Marvin Evans, a Unitarian minister and leader of a group of clergy supporting the inititive, says Dr. Jonsen's argument assumes that any hastening of death is wrong.

"Death is not the enemy," said Rev. Evans. "Death is part of life. People want control over their own lives, and this is the final and perhaps most important thing in a life."

In one respect both sides agree: the voter turnout on Nov. 5 will set a record.

Dr. M. J. Fox To Lecture Here Tonight

Richmond Times-Dispatch, Friday, April 9, 1948

America's role in world reconstruction will be discussed by Dr. Melvin J. Fox, special consultant to the Committee on International Economic Policy at the Carnegie Endowment for International Peace, in an address in Medical College of Virginia Hospital auditorium at 8 o'clock tonight.

Dr. Fox is coming to Richmond under the auspices of International Relations Clubs of four colleges in this vicinity, in co-operation with the Richmond Area University Center. The sponsoring clubs are at Richmond and Westhampton Colleges of the University of Richmond, at Randolph-Macon College, and at the Richmond Professional Institute, of the College of William and Mary.

In addition to his work as Carnegie consultant on economic policy, Dr. Fox is research director of the Committee for the Marshall Plan, and is a member of the board of directors of the United China Relief. Just a year ago he visited London, Cairo, Arabia, India, Burma, Siam, French Indo-China, Hongkong and Manila on an around-the-world cruise for the China Relief.

Preparations for Dr. Fox's lecture were made by club presidents of the four co-operating schools—Vivian Berton, of Westhampton College; Ann Sullivan, RPI; Baine Harris, Richmond College, and Clyde Tucker, Randolph-Macon—and by Marvin Evans, of Randolph-Macon; William G. Bowler and Donald Bayy, of Richmond College; Eleanor Pitts, Mary Cross and Helen McDonough, of Westhampton College.

William Taylor Hood - 1901 *

William Taylor Hood, the son of James and Matilda Quinn Hood, was born at Parkersburg, Pennsylvania October 2,1846 and died at the age of 85, August 21,1931. As a young man he considered moving West, but was persuaded by Samuel C. Kent to go to Virginia instead. In the winter of 1865 he began work in Mr. Kent's nursery at $150 per year and board. In March 1866, he ploughed the first furrow for the Richmond Nurseries of Franklin Davis & Company. In 1867 he was promoted to the position of foreman.

He continued as production foreman until January 1876 when he bought a one-third interest in the Richmond Nurseries, going into partnership with Franklin Davis and Samuel C. Kent. By 1880, Franklin Davis was running the Baltimore Nurseries of Franklin Davis & Company, and Samuel Kent had returned to Pennsylvania,

but both continued as partners in the Richmond Nurseries. In February 1887, W. T. Hood became associated with C. W. Winn in Hood & Winn, Old Dominion Nurseries. In 1889, Mr. Winn withdrew to enter the tobacco business and the nursery business was continued as W. T. Hood & Company, Old Dominion Nurseries. By the 1890's the nursery had 350 acres and was advertised as the largest nursery south of the Potomac.

W. T. Hood married Annie Bell Williams on August 25,1881. She died March 31, 1926. Their son, Kent Williams Hood (18841936) was associated with W. T. Hood & Company until his death in 1936. The nursery business was continued by Kent's widow, Annie Collins Hood and the Virginia Trust Company as executors of the Kent W. Hood trust until 1953. W. T. Hood's granddaughter, Mary Hood Evans, and a great-grandson, David Marvin Evans live in Seattle, Washington.

W. T. Hood was a member of the American Association of Nurserymen for forty-five years. He was the second president of the Southern Nurserymen's Association, presiding over the convention held at Asheville, North Carolina in 1901.

Two fruits introduced by W. T. Hood & Company were the "Overall Cherry" and a strawberry, "Tennessee Prolific". In 1908 W. T. Hood and I. Howard Williams established an orchard near Greenwood, Virginia later operated as the Mountain Hollow Orchard in partnership with Mr. Alwood.

For many years Mr. Hood was active in the Grace Covenant Presbyterian Church of Richmond.

Marvin Davis Evans - Memoir

In his book Pearl's Boy (2010) Reverend Evans, a retired Unitarian minister, reflects back on his life of more than eight decades. From his childhood in rural Virginia, his career as minister that took him to Seattle, Boston, and back again to Seattle, his son's friendship with a young Bill Gates, all the way to caring for his terminally ill wife at Wyatt House on Bainbridge Island, this is the story of a life lived fully and, despite family tragedy, a life rich in optimism and faith. Inspiring read.

Unitarians Name First Minister

Rev. [redacted] of Norfolk, Va., has been elected to serve as first minister for Victoria Unitarians.

Victoria Unitarian Fellowship will attain church status when Mr. Evans is installed as minister Thursday at 8 p.m. in the Georgia Room of the Empress Hotel.

Rev. Evans received his BA at Randolph-Macon University in Ashland, Va., and later studied history and political science at Duke.

He was employed for 11 years as an archivist for the State of Virginia and started his theological education three years ago at the University of Chicago.

This is his first ministry.

Participating in the installation ceremony will be Rev. A. Philip Hewett, Vancouver Unitarian Church; Rev. Rudolph Gilbert, Unitarian Church of Spokane; Rev. Richard Steiner, First Unitarian Church of Portland; Rev. Peter S. Raible, University Unitarian Church of Seattle, and Rev. Robert Fulgham, Unitarian-Universalist Church of Bellingham.

Virginian Starts New Society in Victoria

A Virginian, now making his home in Victoria, is the instigator of a new society here.

When Rev. Marvin Evans arrived here in August of 1963, he set about recruiting and influencing a number of Victorians into forming the local branch of the Memorial Society of British Columbia—one of a number of individual branches of the Continental Association of Memorial Societies that has its headquarters in Chicago.

Although he had previously known of the organization, Rev. Evans was almost entirely ignorant of its workings until three years ago when he began his theological training in Chicago.

"During my training," he states, "I studied under Carl Wennerstrom, the first president of the association. I became intensely interested in its workings through him."

The organization has been in operation for some 25 years

Rev. Marvin Evans is convener of the non-profit Memorial Society here in Victoria.

Raible Back in Unitaria
Pulpit as Guest Speaker

The Rev. Peter Raible, minister of the Unitarian Church of Lincoln from 1955-61, will be back in his pulpit today as guest speaker.

Since leaving Lincoln he has served the University Unitarian Church in Seattle, Wash. He is currently serving also as president of the Unitarian Universalist Minister's Assn.

Raible will speak on the topic, "A Real Religion in a Not So Pious Age."

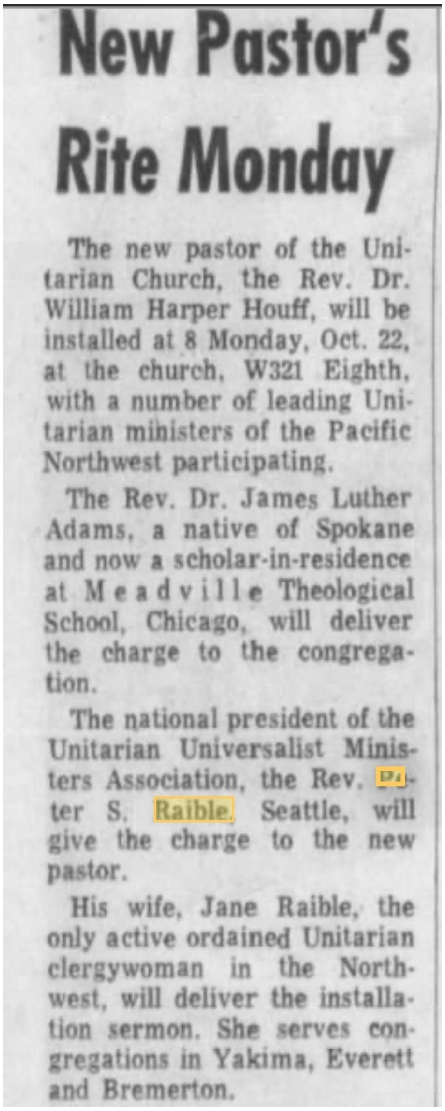
So I guess I'll dive into the wife Association w Mary Gates tomorrow



New Pastor's Rite Monday

The new pastor of the Unitarian Church, the Rev. Dr. William Harper Houff, will be installed at 8 Monday, Oct. 22, at the church, W321 Eighth, with a number of leading Unitarian ministers of the Pacific Northwest participating.

The Rev. Dr. James Luther Adams, a native of Spokane and now a scholar-in-residence at Meadville Theological School, Chicago, will deliver the charge to the congregation.

The national president of the Unitarian Universalist Ministers Association, the Rev. Peter S. Raible, Seattle, will give the charge to the new pastor.

His wife, Jane Raible, the only active ordained Unitarian clergywoman in the Northwest, will deliver the installation sermon. She serves congregations in Yakima, Everett and Bremerton.

Also looking through mountain climbing accidents and found this from 1991

Tecton Management is a property management Co in Puget Sound/Seattle

FEICHTMEIR, Karl Ernest — Of Seattle, Washington, died on Sunday, September 1, 1991, while mountain climbing on Mt. Rainier, in Washington; aged 38; he will be greatly missed by his family: mother, Rachael Balyeat, of San Francisco; father, Raymond A. Feichtmeir and wife, Betsy, of Seattle; sister, Susan Feichtmeir and husband, James F. Greaves, of Oakland; brother, Kurt A. Feichtmeir and wife, Margo D., and their children, Anton and Alicia, of Seattle; brother, Mark R. Feichtmeir, of Oakland; brother, Peter C. Feichtmeir and wife, Sarah D. Patton, of Seattle; grandfather, Ernest H. Balyeat and wife, Charlotte, of Mendocino; and a wide circle of friends and family; Karl completed his undergraduate studies at University of San Francisco and obtained a Master's Degree from the University of California at Berkeley; he was currently president of TECTON Management Corporation, of Seattle.

His Memorial Service will be Friday, September 6, 1991, 3:00 P.M. at University Unitarian Church, Seattle. Remembering Karl as a very generous person, the family requests that friends remember him by contributing, in his name, to a charitable cause of their choice.

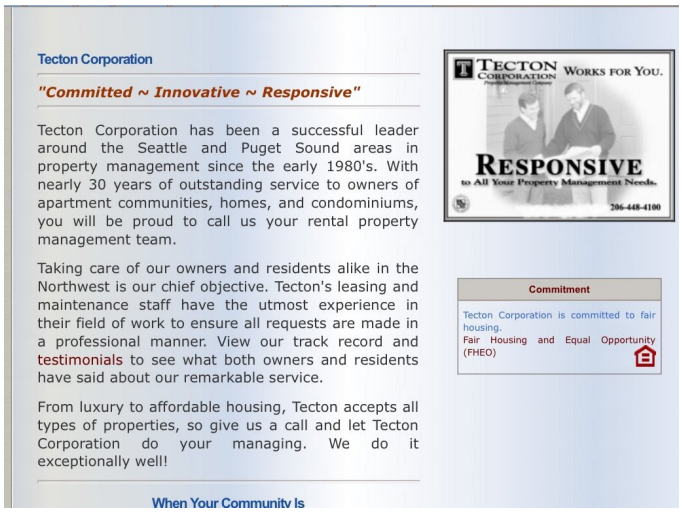
TMLittle · 4:22 AM

And has anyone looked at Evans & Sutherland Corp?

Sorry, I've got Evans in the brain



Tecton Corporation

"Committed ~ Innovative ~ Responsive"

Tecton Corporation has been a successful leader around the Seattle and Puget Sound areas in property management since the early 1980's. With nearly 30 years of outstanding service to owners of apartment communities, homes, and condominiums, you will be proud to call us your rental property management team.

Taking care of our owners and residents alike in the Northwest is our chief objective. Tecton's leasing and maintenance staff have the utmost experience in their field of work to ensure all requests are made in a professional manner. View our track record and testimonials to see what both owners and residents have said about our remarkable service.

From luxury to affordable housing, Tecton accepts all types of properties, so give us a call and let Tecton Corporation do your managing. We do it exceptionally well!

When Your Community Is

TECTON CORPORATION WORKS FOR YOU.

RESPONSIVE to All Your Property Management Needs.

Computer pioneer David Evans is dead at age 74

SALT LAKE CITY (AP)— David C. Evans, one of the pioneers in the use of computers to simulate reality for design and training purposes, has died after a long battle with Alzheimer's disease. He was 74.

Evans, who died Saturday, cofounded Evans & Sutherland Computer Corp. with former Harvard professor Ivan Sutherland. He also established and chaired the University of Utah's department of computer science, giving it a top reputation in the computer graphics world.

Over the years he mentored such computer-industry leaders as Edwin Catmull of Pixar (maker of the film "Toy Story"), John Warnock of Adobe Systems Inc., and James Clark, founder of Silicon Graphics Inc. and Netscape Communications Corp.

Evans & Sutherland pioneered high-quality, three-dimensional computer graphics, creating flight and combat simulators used by the world's airline and military pilots, CIA operatives and space-shuttle astronauts.

In the early 1990s, the company redirected its focus to entertainment to curb falling profits from military downsizing.

He was born Feb. 24, 1924, to David W. and Beatrice Evans. He served in the U.S. Army in Europe during World War II. He married Joy Frewin on March 21, 1947 and the couple had 10 children. Funeral services are scheduled for today.

In addition to hisEstablished a brokerage and investments corp in San Fran before he died in 1998

Probably a DOD cutout with only 96 employees

Evans & Sutherland Co-Founder Honored

The MountainWest Venture Group has named [redacted], Ph.D., its "Entrepreneur of the Decade."

Dr. Evans was co-founder of Evans & Sutherland Computer Corp. with Ivan Sutherland, Ph.D., in 1968. The company has become a multimillion dollar firm with more than 1,000 employees.

"Since 1986, we have annually honored an outstanding business person in the Intermountain Region," said Rick Mandahl, MountainWest Venture Group president. "Given Dr. Evans' far-reaching impact on high technology, education and businesses in and out of Utah, and the fact that we're at the beginning of a new decade, we felt it would be appropriate to recognize him in this manner."

Dr. Evans joined the staff of the University of California at Berkeley as a professor of electrical engineering and computer science in 1962. From 1962 to 1966 he was also employed by the computer division of Bendex Corp. in a number of assignments, including director of engineering research and development.

While at Bendix, he led the development of what was among the first of the personal computers, the Bendix G-15.

In 1965 Dr. Evans became chairman and professor of computer science at the university. In 1968 he teamed with Dr. Sutherland to launch Evans & Sutherland.

Dr. Evans is a member of the National Academy of Engineering. He was elected to the Computer Hall of Fame in 1982 and received the National Computer Graphics Association Award in 1986.

A director of the San Francisco-based brokerage and investment house of Hambrecht & Quist, Dr. Evans has also been associated with a number of venture investments including the start-up of VLSI Technology and Adobe Systems.

The MountainWest Venture Group is a non-profit organization dedicated to fostering high-technology business development in Utah. It claims a membership of approximately 100 people representing more than 70 companies.

Jim Munro? Scout has Munro crossed your radar?

FROM THE ARCHIVES | *The legacy of* KENT EVANS '73

Many are familiar with the story of how, in 1968, four Lakeside School students formed the Lakeside Programming Group (LPG). Fewer know the story behind the name of the Middle School's Evans Theater and the large lecture hall in Allen-Gates, known simply as "Kent Evans."

Kent Evans was one of the founders of LPG with classmate Bill Gates '73, who considered Kent his closest friend at the time; Paul Allen '71; and Ric Weiland '71. Kent's accomplishments by age 16 were impressive. With the LPG, he wrote a program to run payroll for a Portland computer service company. The four also taught computer programming to Middle School students—developing curriculum, writing comments, and assigning grades.

Beyond computers, his interests included politics and backpacking. At 16, he enrolled in a basic university-based mountain-climbing course. Tragically, on May 28, 1972, during the final climb, Kent fell to his death on Mt. Shuksan.

Kent's legacy lives on at Lakeside through Allen-Gates Hall, funded by Gates and Allen, and dedicated in Kent's memory in 1987; the building's lecture hall, named for Kent; Evans Theater, dedicated in his memory in 1999 by Gates; and the Kent H. Evans Memorial Scholarship, established in 1973 by the Evans family. To learn more about Kent Evans, visit the archives' most recent virtual exhibit, Kent Hood Evans '73: Lakeside's Ubiquitous Student at *www.lakesideschool.org/archives* (click on "Special Exhibit").

Leslie A. Schuyler is archivist of the Jane Carlson Williams '60 Archives at Lakeside School. You can reach her at 206-440-2895 or archives@lakesideschool.org. Please contact her if you have questions or materials that you wish to donate, or visit the archives' Web page.

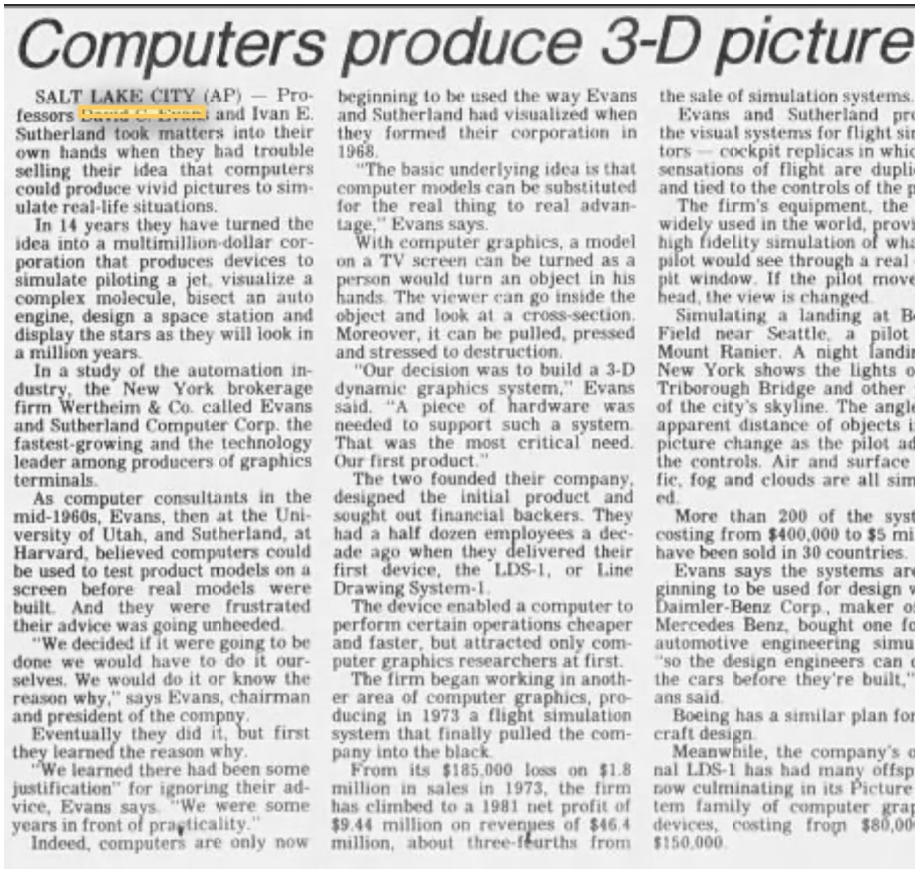
Formed their Corp in 1968

Took it public in 1978

The golden timeframe



Computers produce 3-D picture

SALT LAKE CITY (AP) — Professors [redacted] and Ivan E. Sutherland took matters into their own hands when they had trouble selling their idea that computers could produce vivid pictures to simulate real-life situations.

In 14 years they have turned the idea into a multimillion-dollar corporation that produces devices to simulate piloting a jet, visualize a complex molecule, bisect an auto engine, design a space station and display the stars as they will look in a million years.

In a study of the automation industry, the New York brokerage firm Wertheim & Co. called Evans and Sutherland Computer Corp. the fastest-growing and the technology leader among producers of graphics terminals.

As computer consultants in the mid-1960s, Evans, then at the University of Utah, and Sutherland, at Harvard, believed computers could be used to test product models on a screen before real models were built. And they were frustrated their advice was going unheeded.

"We decided if it were going to be done we would have to do it ourselves. We would do it or know the reason why," says Evans, chairman and president of the compny.

Eventually they did it, but first they learned the reason why.

"We learned there had been some justification" for ignoring their advice, Evans says. "We were some years in front of practicality."

Indeed, computers are only now beginning to be used the way Evans and Sutherland had visualized when they formed their corporation in 1968.

"The basic underlying idea is that computer models can be substituted for the real thing to real advantage," Evans says.

With computer graphics, a model on a TV screen can be turned as a person would turn an object in his hands. The viewer can go inside the object and look at a cross-section. Moreover, it can be pulled, pressed and stressed to destruction.

"Our decision was to build a 3-D dynamic graphics system," Evans said. "A piece of hardware was needed to support such a system. That was the most critical need. Our first product."

The two founded their company, designed the initial product and sought out financial backers. They had a half dozen employees a decade ago when they delivered their first device, the LDS-1, or Line Drawing System-1.

The device enabled a computer to perform certain operations cheaper and faster, but attracted only computer graphics researchers at first.

The firm began working in another area of computer graphics, producing in 1973 a flight simulation system that finally pulled the company into the black.

From its $185,000 loss on $1.8 million in sales in 1973, the firm has climbed to a 1981 net profit of $9.44 million on revenues of $46.4 million, about three-fourths from the sale of simulation systems.

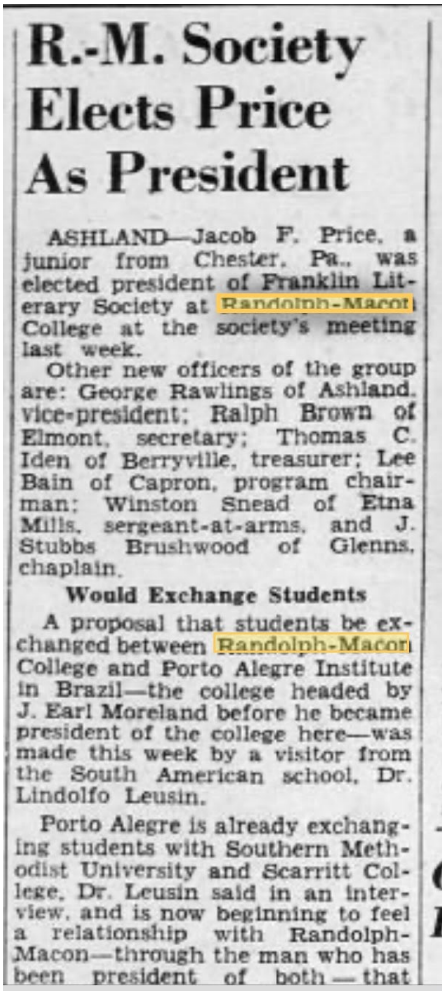
World exchange students in Brazil

- Mom was a social worker

- Save the kids Foundations

- Dad is minister advocating Euthanasia

-Both used public school initiatives for social change



R.-M. Society Elects Price As President

ASHLAND—Jacob F. Price, a junior from Chester, Pa., was elected president of Franklin Literary Society at Randolph-Macon College at the society's meeting last week.

Other new officers of the group are: George Rawlings of Ashland, vice-president; Ralph Brown of Elmont, secretary; Thomas C. Iden of Berryville, treasurer; Lee Bain of Capron, program chairman; Winston Snead of Etna Mills, sergeant-at-arms, and J. Stubbs Brushwood of Glenns, chaplain.

Would Exchange Students

A proposal that students be exchanged between Randolph-Macon College and Porto Alegre Institute in Brazil—the college headed by J. Earl Moreland before he became president of the college here—was made this week by a visitor from the South American school, Dr. Lindolfo Leusin.

Porto Alegre is already exchanging students with Southern Methodist University and Scarritt College. Dr. Leusin said in an interview, and is now beginning to feel a relationship with Randolph-Macon—through the man who has been president of both — that

B.C. Unitarians Acquire Land

British Columbia Unitarians have acquired a 160-acre tract of land on the east side of Kootenay Lake for use by Unitarian camps and conferences, it was announced at a meeting of the B.C. Unitarian Council in Vancouver.

"It has a white sandy beach, meadowland and a waterfall," says Rev. Marvin Evans, minister of Victoria Unitarian Church, who attended the meeting.

With him were 17 members of the Victoria church and representatives from Cowichan, Nanaimo and Courtenay.

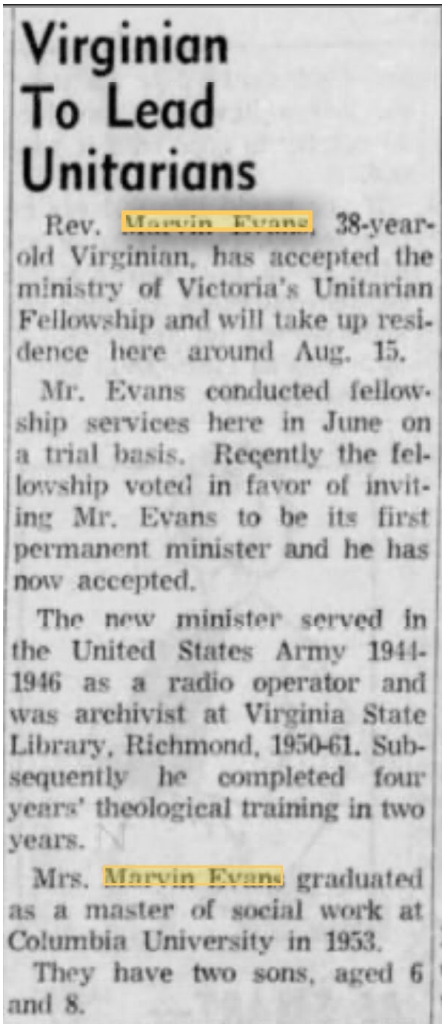
And he was a radio operator in the Army (1944-1946)

Note : ... being age 38, this would be about 1963 ...



Virginian To Lead Unitarians

Rev. Marvin Evans, 38-year-old Virginian, has accepted the ministry of Victoria's Unitarian Fellowship and will take up residence here around Aug. 15.

Mr. Evans conducted fellowship services here in June on a trial basis. Recently the fellowship voted in favor of inviting Mr. Evans to be its first permanent minister and he has now accepted.

The new minister served in the United States Army 1944-1946 as a radio operator and was archivist at Virginia State Library, Richmond, 1950-61. Subsequently he completed four years' theological training in two years.

Mrs. Marvin Evans graduated as a master of social work at Columbia University in 1953.

They have two sons, aged 6 and 8.

2012-06-sound-archivist-vol-1-no-1.pdf

By Leslie Schuyler When I first began as the archivist at Lakeside, I knew very little about the Lakeside Programming Group (LPG). And by very little, I mean almost nothing. I had heard of Microsoft, however, and I knew a bit about its founders, Bill Gates and Paul Allen. Gates, because he was everywhere, and Paul Allen, because I had lived in Seattle for eight years, been to his EMP museum, listened to KEXP, and a friend of mine had worked for Vulcan, his investment company. I knew these two founded Microsoft, but that's where my knowledge ended. When I saw that Lakeside had an archives (and was hiring its second archivist), I assumed that this must have something to do with its high profile alumni. When I interviewed for the position in 2008, they took me on a tour of campus. One of the stops was what Bruce Bailey (an alumnus of the class of '59 and a staff member since 1970) called "the shrine." The shrine's an exhibit, complete with a 1970s desk, an ASR-33 Teletype terminal (the model of machine used by students in the 60s and 70s), and life size photos of Gates and Allen when they were students. Text panels describe the creation and accomplishments of the LPG, which was, for all intents and purposes, the precursor to Microsoft. Much has been written about the founding of Microsoft, most of which mentions LPG in passing and focuses on Allen and Gates. Over the last four years, I've spent my time getting the archives inventoried and taking care of high priority preservation issues so I hadn't, until very recently, had time to delve further into the history of the LPG. **Then, in the winter of 2010, Marvin Evans, the father of a Lakeside alumnus, published an autobiography. In it he dedicated a chapter to his son, Kent Evans, who attended Lakeside in the late 60s and early 70s, was a member of the LPG, and a close friend to Bill Gates.** As an employee of Lakeside, I hear the name "Kent Evans" on a daily basis because a large lecture hall in AllenGates (the math and science building built in 1987) is named for him. I also know that Lakeside has a Kent Evans scholarship, a Kent Evans rowing shell, and an Evans Theater in its Middle School. And yet, most of the current staff and faculty don't know who Kent was. Once I overheard colleagues in a staff meeting (which was taking place in Kent Evans lecture hall) wonder aloud whether there was a hyphen between the "Kent" and the "Evans." So, with Marvin Evans's autobiography fresh in my mind, I decided to create a virtual exhibit about Kent. This is what I discovered: Kent Evans was born with a severe cleft lip and palate. His father writes that this "didn't seem to affect [Kent] apprec

iably, except to make him more sensitive to people with similar imperfections." **(Evans, Pearl's Boy: A Memoir, 2010) Kent began attending Lakeside in the fall of 1966 as a seventh-grader.** He was smart, outgoing, and "interested in everything." (June 1972 Lakeside Tatler newspaper) He enjoyed politics (he and a friend campaigned for Hubert Humphrey in 1968), was a Mountaineer, and a sailor. And he was fascinated with computers. **In 1968, when Kent was in the 8th grade, the Lakeside Mothers' Club donated funds from its Rummage Sale toward a Teletype console to be housed in a basement room of the math building.** The machine was connected via the phone line to an off-campus computer that students could communicate with using three programming languages: FORTRAN, ALGOL, and BASIC. Bill Gates, in an interview conducted by the Smithsonian in 1995 described what happened next: "The Amount of time that we'd spend in this particular room that had the Teletype was quite extreme. And pretty quickly there were four of us who got more addicted, more involved, and understood it better than the others. And those were myself, Paul Allen who later founded Microsoft with me, Ric Weiland who actually worked at Microsoft in the early days, and Kent Evans, who was my closest friend and most my age. ...So, the four of us became the Lakeside Programming Group. We were the hardcore users." (Bill Gates, Oral History Interview with the Smithsonian, 1995) The LPG formed in 1968. During the 1970-71 and 1971-72 school years, the group taught computer programming classes to Lower/Middle School students. And, in 1971-72, these four young entrepreneurs programmed a payroll system for a computer services company based out of Portland, Oregon. The LPG took the 7 a.m. Greyhound bus from Seattle to Portland, met with their clients, and"hammer[ed] out an agreement on future work" (Evans, Pearl's Boy). As Kent writes in his journal, they

finished by 5 p.m. and decided to get something to eat before boarding the bus back to Seattle. Their new associates at the client company had suggested the Hilton, "and >.HQW@` was for it but Bill [Gates@ chose the Hamburger Train." Kent summed up his thoughts about Hamburger Train (a restaurant in which food was served on model trains that circled the tables) this way: "Not bad, but after a successful day of business talks?" After Allen and Weiland (who were two years older than Gates and Evans) graduated in 1972, Lakeside hired the remaining members of the LPG to program the school's schedule. Kent and Bill were in the midst of this and other projects when Kent, a Mountaineer and a student in a UW climbing class, fell several hundred feet while climbing Mt. Shuksan. On the evening of May 28, 1972, he was airlifted by helicopter to the hospital in Bellingham where he was pronounced dead. Kent was a junior in high school, just barely 17 years old.

Kent's death is ultimately what brought Bill Gates and Paul Allen together. Two years after the scheduling program for Lakeside was completed, Gates and Allen founded Microsoft.

Background and education

[Anthony Stephen] Fauci was born December 24, 1940, in Brooklyn, New York City, to Stephen A. Fauci and Eugenia A. Fauci, owners of a pharmacy. His father worked as the pharmacist, his mother and sister worked the register, and Fauci delivered prescriptions. The pharmacy was located in the Dyker Heights section of Brooklyn, one neighborhood away from his family home in Bensonhurst.[2]

Fauci's paternal grandparents, Antonino Fauci and Calogera Guardino, were from Sciacca, Italy. His maternal grandmother, Raffaella Trematerra, from Naples, Italy, was a seamstress. His maternal grandfather, Giovanni Abys, was born in Switzerland and was an artist, noted for landscape and portrait painting, magazine illustrations (Italy) as well graphic design for commercial labels, including olive oil cans. His great-grandparents emigrated to the US in the late 19th century. Fauci grew up Catholic.[2][3][4]

Fauci attended Regis High School in Manhattan's Upper East Side, where he captained the school's basketball team and graduated in 1958.[5][6] He then went to the College of the Holy Cross, graduating in 1962 with a Bachelor of Arts in classics. Fauci then attended medical school at Cornell University Medical College where he graduated first in his class with a Doctor of Medicine in 1966.[2] He then completed an internship and residency at the New York Hospital-Cornell Medical Center.[6]

Career

Fauci discusses his work in 2020 (4 minutes)

In 1968, Fauci joined the National Institutes of Health as a clinical associate in the Laboratory of Clinical Investigation (LCI) at the National Institute of Allergy and Infectious Diseases.[7] In 1974, he became Head of the Clinical Physiology Section, LCI, and in 1980 was appointed Chief of the Laboratory of Immunoregulation. In 1984, he became director of NIAID, a position he still holds as of 2020.[1] In that role he has the responsibility for an extensive research portfolio of basic and applied research on infectious and immune-mediated illnesses.[7] He has turned down several offers to lead his agency's parent, the NIH, and has been at the forefront of US efforts to contend with viral diseases like HIV, SARS, the 2009 swine flu pandemic, MERS, Ebola and severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2).[8]

He played a significant role in the early 2000s in creating the President's Emergency Plan for AIDS Relief[9] and in driving development of biodefense drugs and vaccines following the 9/11 terrorist attacks.[10]

DEGREES TO 5,227

tler Celebrates Triple Anni-
ersary at Morningside
Commence—Local Grads.

When the shadows fall over
rningside Heights this afternoon
27 Columbia University seniors
l have deserted that status for
ranks of the alumni.
President Nicholas Murray But-
celebrating his 70th birthday,
50th anniversary of his own
duation and the 30th anniver-
y of his presidency, will confer
degrees and deliver the address.
Honorary degrees will be pre-
ted to Albert Henry Wiggin,
ase National Bank directors'
irman; Thomas W. Lamont of
J. P. Morgan Co., Edwin H.
derson; director of the New
rk Public Library; Robert Frost,
Beta Kappa poet of yesterday;
rge Norlin, University of Colo-
o president; Walter Lippman,
rnalist; Dugald C. Jackson of
ssachusetts Institute of Technol-
and Channing Lefebvre, organ-
and choirmaster at Trinity
rch, Manhattan.

lections to Phi Beta Kappa were
ounced today in connection with
commencement exercises. In-
ded in the list are the following
oklyn and Long Island students:
yer A. Girshick, Aaron Moldover, Sou-
Z. Avedikian, Jack Avins, Everett I.
Baker, Leonard Bases, Milton Black,
es M. Egan, George Gittell, Henry J.
chmidt, Theodore Greenebaum, Rob
all, Jay J. Hodupp, Abraham S. Jacob-
Peter F. Kihss, Milton Klein, Herbert
Kramer, Norman I. Laidhold, Leonard
kowitz, Eli S. Marks, Aaron Merker,
ncis J. Murray, Samuel Prince, Isaac
wartz, Sidney Siegel, Milton Socolof,
g Solomon, Joseph Steigman, Jerome
trumpf, Henry H. Wiggins and Stanley
Vronker.
For the first time in the history
Columbia College two seniors
for the highest academic stand-
Milton Klein, of 446b 69th st.,
erne, L. I., was one. The Albert
ier Green Memorial Prize, the
ards for this ranking, was there-
s divided.

The Columbus Hospital Holds Maytime Ball On Saturday at the Pierre

Lilacs and appleblossoms will form the main decorations for the ballroom suie of the Hotel Pierre on Saturday, when the Maytime Ball of the Junior Auxiliary of Columbus Hospital will be held for the benefit of the Children's Wards and the Nurses Home Building Fund. Flowering trees will form an avenue leading to the ballroom which will be decorated with garlands of similar and blossoms.

Madeline Repetti, general chairman, reports that all committees are making splendid headway with duties entrusted to them and that the evening promises to be a success in every way. The executive committee of which the following are members:

Louise Tassara Venturi, Estelle Kleeman, Adele De Pompeo, Ann Satbile, Mildred Poggi, Anne V. Spica, Adelaide De Clemente, Laura Di Giorgi, Mildred Prato, Mae Brunelli, Aida Pavesi, Zella Lombardi, Emma Sutera, Margaret Repetti, Enrica Casazza and Marie Zito are putting forth every effort to make this splendid success with the cooperation of the general and associate committees.

1935-05-19-the-brooklyn-standard-union-pg-8-clip-columbus-hospital

The associate and floor committee, headed by Dr. Carl G. Candiloro and Dr. Thomas Iovino as co-chairmen is composed of John J. Asselta, Louis Barbieri, Joseph Carlino, Vincent J. Catoggio, Dr. Frank Ciafolo, Dr. Albert A. Cinelli, Dr. F. Contini, Frank Cuppola, Samuel Di Falco, Anthony Di Giovanni, Joseph Foley, Dr. Joseph Gardella, Thomas Grant, Nazarin Gullo, Dr. Harold Judd, Dr. Eugene Manfredonio, Patrick Mercolino, Dr. Anthony Mecca, Dr. Guy Mecca, Salvator Milano, Caesar Nobiletti, Horace Pascal, Dr. Vincent Petrelli, Romeo Petronio, John Phelan, James Previtale, Dr. Alfred A. Schenone, Anthony Sessa, jr., Dr. Joseph Tesi, Peter Brunelli, George Casazza, John B. De Pompeo, John Downs, Stephen Fauci, Dr. Julius Lombardi, Oscar Pavesi, Charles Reale, Robert Spinelli, James Sinnott, Albert Spica, Harold Stevens, Paul Venturi and George Zito.

BROOKLYN BUILDING CHANGES OWNERS

Cash Above $15,000 Mortgage Is Paid for Utrecht Ave. Apartment House

Mollie Serper sold to Peter A. and Stephen A. Fauci for cash above a first mortgage of $15,000 held by the Greater New York Savings Bank the two-story building with three stores and two apartments at 7820 New Utrecht Avenue, Brooklyn. Title insurance was furnished by the City Title Insurance Company on the parcel, which is assessed for $23,000, of which $11,000 is on the 20 by 120 foot plot.

The same firm certified the title for the two-family dwelling at 1059 East Eighth Street, purchased by Morris and Beatrice Lapidus from Ella McCann. The consideration was cash above a first mortgage of $4,400.

Cantasano Brothers, rag dealers, bought through Baffa & Dixon, brokers, the three-story industrial building and the one-family house adjoining, known as 159-61 Twentieth Street. The combined plot is 75 by 100 feet and the valuation for taxation is $17,400.

A client of S. L. Furst Company sold to Harry Hurwitz the three-story business building, 20 by 100 feet, at 4412 Fifteenth Avenue, in an all-cash deal.

All cash also was paid by a client of August R. Fasolino to Katherine V. Garvy for the one-family house at 8786 Bay Sixteenth Street, Bensonhurst, according to Slomka Bros., Inc., brokers. Wingate & Cullen represented the seller.

Michael P. Curnin, Inc. and Olaf Olausen sold for the HOLC the two-family residence with eleven rooms and two baths, 40 by 100 feet, at 638 Eighty-third Street.

The same Federal agency sold to Henry J. Lillienfield for occupancy the ten-room dwelling, 40 by 100 feet, at 1977 East Fourteenth Street, Eugene J. Keely, Inc., acting as broker.

Heat Seems to Have Spurred Party Pace

By RUTH G. DAVIS
Society Editor

With the arrival of the warm weather, we really thought that the parties in town would slow down, and that all one would want to think of would be the cool breezes of the beach or mountains. However, we were quite wrong. Come what may—of course, meaning weather—parties are with us nevertheless.

The warm weather didn't dim the spirits of a large group of guests who surprised Miss Madeleine Walsh Smith, president and founder of Anthonian Hall, at a party given in her honor by Mrs. Patrick Goodman and her daughter, Miss Elizabeth Goodman, in a private dining room at Michel's.

There were well over 100 intimate friends present to join with the Goodmans in paying honor not only to Miss Smith as a friend of the blind, but as their friend.

Miss Smith felt as if she were having a graduation party with the many floral tributes she received and among them was an exquisite corsage of orchids, which she wore.

MISS GOODMAN PRESENTED Madeleine with a gold link bracelet with a large heart pendant which Mrs. Goodman said had a particular significance. The bracelet was a gift of the hostess.

Harry Donaghy entertained with baritone solos accompanied by Mrs. Donaghy. Special guests at the party were Monsignor J. Jerome Reddy, the Very Rev. Peter Kelaher, the Rev. Andrew Ansbro, Dr. Marcus Hankinson, Daniel Connolly, Miss Mary A. Kennedy, Miss Smith's mother and sister, Mrs. John Smith and Miss Gladys Smith, and her aunt, Miss Margaret Walsh and Miss Marian Conmy.

As thoughtful hostesses, the Goodmans made plans to keep the memory of the party alive for Miss Smith by having a recording made of a message from each guest.

THE OTHER SURPRISE PARTY was for Miss Gloria Fauci, daughter of Dr. and Mrs. Peter A. Fauci of 225 Avenue P, who was honored at a shower by Mrs. Angelo Scopellito of 1612 W. 5th St. The bride-elect, who will be married to Michael A. Meloni, wore a white and black harem-draped silk print. Mrs. Fauci was wearing a green and gold print frock. The gifts were very handsome and included household items such as electric equipment, etc. The buffet supper was served at a table decorated with pink and white parasols and dolls representing the bride and her bridal party.

Among the guests were Mrs. Sam B. Fatta, Miss Mary Paterno, Mrs. George W. Acritelli, Mrs. Jack Colelli, Mrs. Anthony Cannonito, Mrs. John Genova, Mrs. Jack LaBarbara, Mrs. Joseph Ciaccio, Miss Gertrude Schwartz, Mrs. Peter Ciaccio, Miss Jeanette Paterno, Miss Mary Prisco, Mrs. John Mayo, Miss Emma Mayo, Mrs. Joseph Esposito, Mrs. Philip Chiola, Mrs. Stephen A. THE TABLET, SATURDAY, NOVEMBER 29, 1952

GIVEN TESTIMONIAL

J. WILLIAM HOPE

William Hope Honored By Accountants Guild

A testimonial dinner to J. William Hope, 1951-1952 president of the American Institute of Accountants and prominent Catholic of Bridgeport, Conn., was given by the Catholic Accountants Guild of the Diocese, the only organization of Catholic accountants in the United States, at the Columbus Club Tuesday.

Mr. Hope is well known for his leadership in charitable, civic and educational activities in Bridgeport, and at one time served as treasurer of the State of Connecticut. As president of the American Institute of Accountants he achieved the highest distinction in the accounting profession, the leadership of the national association of certified public accountants.

founder, presented a scroll to Mr. Hope in behalf of the Guild which included the following citation: "Mindful of the command of Almighty God that His creatures upon which He bestows varying talents and aptitudes shall develop and utilize them to the fullest extent in the service and to the honor and glory of God, we commend J. William Hope, a true Catholic gentleman in his life and in his work, for his continuing contributions to and his professional endeavors where his light shines before men."

Among those assembled to honor Mr. Hope were: Charles H. Towns, president, and Simon Loeb and Henry A. Horne, past presidents of the New York State Society of Certified Public Accountants; Henry E. Mendes and Russell G. Rankin, prominent New York accountants; and the presidents of the four other Catholic professional guilds of the Diocese: Dr. Louis P. Breglio, physicians; Andrew P. Backus, lawyers; Dr. Michael N. Marty, dentists; Stephen A. Fauci, pharmacists; and Rev. Matthew P. Kelly of Our Lady of Good Counsel parish, Brooklyn, moderator of the Guild since its inception in 1947.

Gustave A. Reh, Jr., president of the Accountants Guild, announced the first annual memorial Mass for deceased members will be held at St. Boniface Church, Brooklyn, Tuesday, Dec. 2, at 12:10 p.m.

Catholic Pharmacists Guild

The Catholic Pharmacists Guild of the Diocese of Brooklyn was formed in January, 1952. One of its purposes is to help guide Catholic pharmacists morally in pursuit of their profession. Other worthy purposes are: to help foster and maintain high ideals in the vocation of pharmacy; second, to promote better understanding and brotherly love among pharmacists and, third, to pledge themselves a) to refuse to sell contraceptive devices, b) to refuse to sell indecent literature and to abide by the norms of the Decent Literature Guide and c) to make an annual Day of Resollection and to participate in other spiritual activities.

The Guild is under the auspices of the Diocesan Hospital Association. It embraces all Catholic pharmacists of the Diocese, including hospital pharmacists, students of pharmacy, salesmen and members of pharmaceutical concerns. Rev. Alfred A. Varriale, of St. Bernadette's Church, Brooklyn, is the moderator. Stephen A. Fauci is president.

CONVENTION HELD BY PHARMACISTS

International Meeting Regrets Lack of U.S. Representation

The biennial convention of the International Federation of Catholic Pharmacists, held in Saragossa, Spain, Sept. 4-11, regretted that the Americas and especially the United States were not represented, it was revealed here this week by Gerald Nolan, delegate from Australia.

Pope Pius sent his Apostolic Blessing to the meeting and the Archbishop of Saragossa sat in on all the sessions, which considered the moral and ethical problems of pharmacists. J. L. Leinstere of Belgium is president of the group; G. Parat, secretary; Madame M. Dureaux, treasurer; and Father Dubois, O.P., moderator. Twelve nations were represented.

Mr. Nolan, who is on his way home at the completion of a six-month study of pharmacy throughout the world, was appointed by the convention to try to arrange for American representation at the next meeting in Germany in 1956.

While in New York, Mr. Nolan met with Dr. John L. Dandreau, dean of the School of Pharmacy at St. John's University, who told him of the local Catholic Pharmacists' Guild, of which Stephen A. Fauci of 8302 13th Ave., Brooklyn, is president and Rev. Alfred A. Varriale of St. Bernadette's Church is moderator.

Dr. Dandreau promised that the local guild, which is currently reorganizing and seeking new members, would consider the invitation to the convention in 1956.

Mr. Nolan, who said the Australians will never forget the debt of gratitude they owe the United States for the assistance of American troops during the dark days of World War II, asserted that the Catholic Pharmaceutical Guild of Australia is quite eager to establish liaison with its American counterpart.

Dr. Alfred J. Restaino

Of **Wilmington, DE** died November 19, 2002 of ALS (Lou Gehrig's disease.

Dr. Restaino was born in Brooklyn, NY February 18, 1931 to the late Clement and Cecilia Orlando Restaino. He received his BS degree magna cum laude from St. Francis College of New York, and his MS and PhD in physical and polymer chemistry from Brooklyn Polytech Institute, now New York Polytechnic University. He credits his 2 close friends and mentors, Stephen A. Fauci and Dr. Donald Metz as having a significant impact on his life and career.

At his 1980 retirement, he was director of corporate research and development for ICI Americas. Dr. Restaino was credited with over 150 publications and 50 patents. Some of his patents became successful commercial products in oil recovery, water pollution and high performance plastic resins and polymers. During the 1960s, he served as a member of the Atomic Energy Commission. Dr. Restaino served as the executive director of the office of Science and Technology to Governor Mike

2002-11-20-the-news-journal-wilmington-pg-b-5-clip-restaino

Castle and was instrumental in seed funding for the Center for Composites Material Research at the University of Delaware, where he also served as adjunct professor of physical chemistry in the 1970s.

He is survived by his wife of almost 50 years, Raffaela B. Sessa Restaino; 4 sons, Stephen, Alfred, Peter and Mario; and 1 daughter, Lisa Restaino Flaherty; their spouses; 13 grandchildren; and 3 brothers, Fred, Neil and Clem.

A viewing will be held from 6-9 pm on Thursday, November 21 at the MCCRERY MEMORIAL FUNERAL HOME, 3924 Concord Pike, Wilmington. A Mass of Christian Burial will be offered at 10:30 on Friday, November 22 at St. Mary Magdalen Catholic Church, Concord Pike & Sharpley Rd., Wilmington. Interment will be in St. Joseph's on the Brandywine Cemetery, Wilmington.

Condolences may be sent to www.mccreryfuneralhome.com

2008 (May 13) - Passing of Stephen Fauci

FAUCI--Stephen A., on May 13th, 2008. Much loved for his kindness and sense of humor. Graduated Columbia School of Pharmacy, ran a neighborhood drug store in Brooklyn and worked at Memorial Sloan-Kettering Pharmacy. His wife Eugenia passed away in 1965. Survived by his daughter Denise Scorce, his son Dr. Anthony S. Fauci, five grandchildren and three great-grandchildren. Mass Friday, May 16th at 10am, St. Catherine of Siena Church, 411 East 68th St., NYC. Burial at Green-Wood Cemetery.

Brooklyn boy grew to be Bush's hero

1988-10-16-the-daily-news-new-york-pg-45-clip-fauci

To Vice President Bush he's a hero, and Dr. Anthony Fauci sure is a hero, no doubt about that. But wasn't Tony Fauci the kid that Patsy Barilla used to send to the candy store to fetch him a quart of ice cream? As a kid in Brooklyn, young Tony was a good ballplayer, an altar boy and a top student, and if memory serves he was the kid, or one of the kids, who used to make the run to the candy store for Patsy's ice cream back in the old neighborhood on 13th Ave. in Dyker Heights.

"I think of Dr. Fauci, top doctor at the National Institutes of Health, working hard doing something about research on this disease of AIDS," Bush replied when asked during the presidential debate the other night to name persons he considered to be inspirational heroes in American life today.

Neighborhood guys got a lift out of hearing such a nice tribute paid to one of their own. Hey, a Brooklyn boy got a mention to the whole nation watching on TV. Bush, of Andover and Yale, looks up to Tony Fauci from St. Bernadette's, who fetched Patsy's ice cream on hot summer nights in Dyker Heights.

Dr. Anthony Fauci, 47, heads the Office of Aids Research, established last April to seek a vaccine against the AIDS virus. His groundbreaking discoveries about the human immune system won him the U.S. Public Health Service Distinguished Service Medal in 1984, in addition to numerous other awards. He routinely works 15-hour days on a personal mission to defeat deadly AIDS.

Tony grew up over his father's pharmacy, on the corner of 83d and 13th, across from the heart and soul of the neighborhood, the local Catholic parish, St. Bernadette's. The pastor of St. Bernadette's was Patsy Barilla. Oh, to those who stand on formality, he was Msgr. Pasquale Barilla. But nobody except possibly Pope Pius XII ever called him that. To everybody in the neighborhood he was Patsy. He was 5-feet-6 and weighed 300 pounds. He sat outdoors on a big chair in front of the rectory at night and smoked cigarets and gabbed with passersby and sent local kids like Tony Fauci to the candy store to buy him ice cream. Patsy Barilla was a legend in the old neighborhood, and now one of his former errand boys is George Bush's hero. Life sure takes some interesting twists.

Msgr. Al Varriale and Joe Torregrossa and Frankie Dee and others from the old neighborhood still remember Tony Fauci, George Bush's hero, with affection and respect. Though small, Tony was an excellent basketball player. "A real pepperpot, very kinetic, good at stealing the ball, quick as a wink," says Msgr. Varriale, coach of the parish teams in the 1950s, now retired pastor of nearby Our Lady of Guadalupe. Joe Torregrossa, who has lived more than 60 years on 82d and 14th, was the parish baseball coach. Tony was his shortstop. "Tony was always a good boy, and a great competitor," remembers Joe. "He was never late for practice."

The Faucis were a model family. Mr. Fauci and Father Al formed the Catholic Pharmacists Guild, a spiritual and professional association. Mrs. Fauci was active in the parish Rosary Society. Tony's sister helped out afternoons in the rectory. The family went to church together. Everyone in the neighborhood liked and respected the Faucis. They were the kind of people who made Brooklyn the Borough of Homes and Churches.

IN THE AUGUST ISSUE of Current Biography magazine, Dr. Anthony Fauci got a glowing write-up for his tireless work in AIDS research. "You can't match the excitement of knowing you're doing something for humanity," he says in the piece. Asked his personal motto, he replies, "Always strive for excellence." Dr. Fauci is a husband and father now, and a brilliant physician, but he remembers where he came from, saying, "I had a very happy, typical New York childhood." He fetched Patsy Barilla's ice cream, and he grew up to be George Bush's hero.

1989 - "In their own words" - Interview by National Institute of Health of Dr. Anthony Fauci

Source - [HG003K][GDrive] and [HG003L][GDrive]

This is an interview with Dr. Anthony S. Fauci, Director of the National Institute of Allergy and Infectious Diseases), in his office at the National Institutes of Health, in Bethesda, Maryland, on March 7, 1989. The interviewer is Dr. Victoria Harden, Director of the NIH Historical Office.

Harden: Dr. Fauci, could you begin by describing the home in which you grew up, your parents, your grandparents and siblings; what you enjoyed doing as a boy, and your elementary and secondary education?

Fauci: I was born in Brooklyn, New York. My grandparents on both my mother's and father's side were born in Italy, except for my grandfather on my mother's side, who was born in Switzerland. They came to the United States at the end of the nineteenth century. **Both my parents were born in New York City and went to public schools in New York City. My father, Stephen Fauci, graduated from the College of Pharmacy, Columbia University, as a pharmacist. My mother, Eugenia Fauci, went to Brooklyn College and Hunter College. They married very young, when they were eighteen years old, and went to college after they were married, while they were still growing up.** I went to the neighborhood parochial schools in New York City. I was brought up in a Catholic grammar and high school environment. I went to Our Lady of Guadeloupe Grammar School in Brooklyn and to Regis High School, a Jesuit high school in Manhattan. I had the interesting experience of having to take a bus and three separate subway trains to get from my home in Brooklyn to high school in Manhattan. I believe that my childhood was a typical, very happy, and very active growing-up period in New York City during the early forties. I was born in December of 1940 in New York City and grew up as a child in the World War II and post World War II years.

My major interest was sports. I lived in a very sports-oriented neighborhood. We used to play basketball from the beginning of the basketball season to the end, baseball throughout the spring and the summer, and then basketball and football again in the winter. My sister, who is three years older than I, also went through the same sort of school system, same grammar school I went to, went to an all-girls' Catholic high school, and ultimately St. John's University in New York City. She was a teacher before she stopped to raise her family.

[...]

Harden: How did a young man who was devoted to sports decide to become a physician?

Fauci: I don't think I can tell you the precise time when I knew that I wanted to be a physician. It was very early on. I know that in high school, when I was deciding the options I would have in college, there really was no question that I was going to be a physician. I went to Regis High School, a Jesuit high school, which had a major impact on my career even up to today. It was a highly academic, exclusive scholarship school. Students from every parochial grammar school in all the five boroughs of New York competed to receive admission, making it highly competitive, and the courses were extraordinary. They were very heavily weighted towards the classics. We took four years of Greek, four years of Latin, three years of French, ancient history, theology, etc. When I was at Regis, it seemed that the very bright people in school really had just a few options. If you wanted to go into medicine, that was fine. The other choices were law, science, engineering, or careers like that. My interest in medicine stems from my keen interest in people, in asking questions and solving problems.

Also, I think there was subliminal stimulation from my mother, who, right from the very beginning when I was born, wanted me to be a physician. She never really pressured me in any way, but I think I subtly picked up the vibrations that she wanted very much for me to be a physician. When the time came to go to college, I went to Holy Cross College, which has an extraordinarily fine reputation for premedical work. They do it in a very interesting way, at least it seemed so back in the fifties. I went to Holy Cross in 1958 and graduated in 1962. At that time, it was not unusual for premedical students to take a very strong classics course in premed. The title of my premed course was “A.B. Greek Premed,” which was a classics course very heavily weighted with philosophy–32 credits of philosophy, plus French, Greek and Latin. At the same time we took the minimal scientific courses to get us into medical school. The students did very well, getting into the best medical schools in the country but with a very strong liberal arts background. The liberal arts background is something that was very much a part of my family because virtually all of my relatives on my mother's side–her father, her brother, and her sister's children–are all artists. They are successful people who made their living through the arts, usually painting. I was always and still am very interested in art, but I am somewhat of a frustrated artist because I certainly don't have the time, and probably not the talent either, to pursue it. I still am very interested in the classics. They were a very important part of my education.

Harden: Would you evaluate the broad, liberal arts, humanistic training and your Catholic upbringing in terms of how they have influenced your performance as a physician and as a researcher? I'm thinking of things like your world view, your interaction with patients, and your approach to ethical questions.

Fauci: You can't separate very well natural abilities in a vacuum from your training, or from the combination of factors that have an influence on how you perform. But certainly, the humanistic education that I had has had a very positive influence on my ability to deal with sensitive situations with people. I credit very much the Jesuit training in precision of thought and economy of expression in solving and expressing a problem and in the presentation of a solution in a very succinct, accurate way. This has had a major, positive influence on the fact that I enjoy very much and am fairly good at being able to communicate scientific principles or principles of basic and clinical research without getting very profuse and off on tangents. This is something that was drilled into us from the very early days in high school.

Harden: Did you continue your interest in sports in college?

Fauci: My interest in it continued, but not my active participation. In high school, I played competitive sports–I played basketball at a time when you could play basketball without being 6'9“ at the shortest. I don't think I would have any chance of playing basketball if I were in high school now. I enjoyed basketball, was the captain of the team and had a very successful time in high school. Alongside it, I played baseball. These were my two major sports. When I went to college, I continued to play a modest amount of intramural sports, but due to the nature of the premedical curriculum at Holy Cross, it was very difficult to be very active in sports. I did not play competitive basketball or even baseball at the college level, since they had very good teams. I could not play as much as I wanted to because the demands of the curriculum were such that you really had to put a lot of time into your studies.

Harden: Could you talk about your experiences at Cornell University Medical College and comment on how actually becoming a doctor compared to your earlier conceptions of the profession?

Fauci: This might be interpreted by some as being paradoxical, but I absolutely loved medical school. It certainly was demanding, but it was one of the most exciting experiences of my life. The exponential curve of knowledge accrual in medical school was so great that it completely overshadowed the fatigue and the stress factors and the other problems that are so commonly seen in medical school. Certainly, medical school training was very stressful, but unquestionably it ranked as one of the happiest periods of my life, because I was learning so much. The later years in medical school and in health care training and what had been my previous idealistic views about medicine did fit together. There really was the opportunity to apply a very basic scientific framework of knowledge to something that is very human, very personal, with all of the sensitivities associated with dealing with human beings. Here I had the advantage of the humanistic training that I had received earlier on in high school and in college. This is a nice dichotomy of medical school, and that's why I think that there is no question that I was meant to be a physician and a physician-scientist. I can't imagine in my wildest dreams doing anything else that would make me as happy as this makes me. I enjoy the polarity. There are strict scientific principles that have to be adhered to in medicine. At the same time a humanistic touch is needed in dealing with people. They have to be combined. You have to combine social aspects, ethical aspects, personal aspects with cold, clean science. It is the art of the physician to put them together in the care of a patient, in the development of a protocol for a disease, the diagnosis or treatment of a problem. This combination exists in every aspect of patient-involvement.

Harden: Who influenced you the most during medical school, especially in your decision to go into immunology?

Fauci: The people who influenced me most in medical school are different from those who influenced my decision to go into immunology. Taking medical school first: My heroes were the strict clinicians of the New York Hospital/Cornell Medical Center. They were and still are in so many respects the real heroes. My teachers, whom I saw on the wards as a student and during my internship and residency, were people whose entire lives were devoted to clinical medicine. They reached such levels of expertise in patient care, diagnosis, and the delivery of patient care that they were really super stars. I tried to emulate them and make myself as good a clinician as I possibly could be. They provided a great inspiration. I think that it is very important for a young medical student to have a role model. There were several of them around at the time.

The reasons I went into immunology and research in general were due to an unusual situation. I left Cornell and went into my internship and residency in 1966. That was at the exponential phase of the Vietnam War, and every single physician went into military service. I can remember very clearly when we were gathered in the auditorium at Cornell early in our fourth year of medical school. Unlike today, we had only two women in the class and seventy-nine men. The recruiter from the Armed Forces came there and said, “Believe it or not, when you graduate from medical school at the end of the year, except for the two women, everyone in this room is going to be either in the Army, the Air Force, the Navy or the Public Health Service. So, you're going to have to take your choice. Sign up and give your preferences.” I had heard about the NIH and the opportunity there. At the time, the NIH was just blossoming, and everyone who had any role in academic medicine spent some time at the NIH. So I put down Public Health Service as my first choice, and then the Navy. Essentially, I came down to the NIH because I didn't have any choice. I was very lucky because I knew that it was a phenomenal scientific opportunity.

When I was trying to decide what laboratory to go to, some of my advisers at Cornell suggested very strongly that I pursue the field of immunology, since I had developed an interest in immunology in medical school. I had done some projects during the summer and had worked for a period with Dr. Marvin Schlesinger, who was the chief of gastroenterology division of the Department of Medicine. I also had worked with [Dr.] Graham Jeffries and [Dr.] Walter Rubin. The project I did as a student turned out to be a successful project. I was lucky, since that doesn't usually happen when you have a student project. Because of this research, I applied for the National Institute of Allergy and Infectious Diseases. It so happened that Dr. Schlesinger knew Dr. Sheldon Wolff at the NIH, and I came down to the NIH for an interview. I was interviewed by Dr. Wolff, and I immediately fell in love with the man. He was just my kind of person–intellectually and personally. I was accepted by Dr. Wolff right off. At the end of my residency, I came down to the NIH to work in the National Institute of Allergy and Infectious Diseases with Dr. Wolff. Over the years, even after he left the NIH, he emerged as the major mentor–personal and scientific–in my life. There have been a number of other individuals whom I have come into contact with who have had a major influence on me, but I think that Dr. Wolff clearly stands out as the person who made the greatest impact on my career.

Dr. Anthony Fauci, director of the National Institute of Allergies and Infectious Diseases.

AIDS funding will finance drug-testing centers in U.S.

By JAN ZIEGLER
UPI Science Writer

WASHINGTON (UPI) — The largest single chunk of AIDS treatment research money in the fiscal 1986 budget — $20 million — is going to 14 medical centers to test drugs that may fight the virus, government researchers say.

The centers will be able to begin immediately testing six drugs that may fight the deadly acquired immune deficiency syndrome virus, Dr. Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, said at a news conference.

"With this coordinated approach we will be able to quickly identify therapies that show early or dramatic effects, be they beneficial or harmful," Fauci said at a news conference with other top government public health officials.

The centers that won the contracts are at Harvard, Johns Hopkins, New York and Stanford universities; the universities of Miami, Pittsburgh, Rochester, Southern California and Washington; the University of California at Los Angeles, at San Diego and at San Francisco; Memorial Sloan-Kettering Cancer Center and the University of Texas M.D. Anderson Hospital and Tumor Institute.

Total first-year cost of the program is estimated at $20 million, Fauci said — the largest single chunk of AIDS treatment research money in the budget.

The government has earmarked $100 million across five years for the program, with the total for treatment research being spent this year at $52 million, officials said.

Fauci's institute, with other branches of the National Institutes of Health, will continue to award research grants to other institutions. Scientists there will be expected to coordinate their research with the new units, he said.

An estimated 3,000 patients are currently enrolled in AIDS drug tests, Fauci said. About 1,000 will be enrolled in the new treatment units and there could be some overlap between the programs.

The units will test drugs on patients with full AIDS and ARC, or AIDS-related complex, a milder set of symptoms that in some patients leads to the virus.

Brooklyn boy grew to be Bush's hero

1988-10-16-the-daily-news-new-york-pg-45-clip-fauci

To Vice President Bush he's a hero, and Dr. Anthony Fauci sure is a hero, no doubt about that. But wasn't Tony Fauci the kid that Patsy Barilla used to send to the candy store to fetch him a quart of ice cream? As a kid in Brooklyn, young Tony was a good ballplayer, an altar boy and a top student, and if memory serves he was the kid, or one of the kids, who used to make the run to the candy store for Patsy's ice cream back in the old neighborhood on 13th Ave. in Dyker Heights.

"I think of Dr. Fauci, top doctor at the National Institutes of Health, working hard doing something about research on this disease of AIDS," Bush replied when asked during the presidential debate the other night to name persons he considered to be inspirational heroes in American life today.

Neighborhood guys got a lift out of hearing such a nice tribute paid to one of their own. Hey, a Brooklyn boy got a mention to the whole nation watching on TV. Bush, of Andover and Yale, looks up to Tony Fauci from St. Bernadette's, who fetched Patsy's ice cream on hot summer nights in Dyker Heights.

Dr. Anthony Fauci, 47, heads the Office of Aids Research, established last April to seek a vaccine against the AIDS virus. His groundbreaking discoveries about the human immune system won him the U.S. Public Health Service Distinguished Service Medal in 1984, in addition to numerous other awards. He routinely works 15-hour days on a personal mission to defeat deadly AIDS.

Tony grew up over his father's pharmacy, on the corner of 83d and 13th, across from the heart and soul of the neighborhood, the local Catholic parish, St. Bernadette's. The pastor of St. Bernadette's was Patsy Barilla. Oh, to those who stand on formality, he was Msgr. Pasquale Barilla. But nobody except possibly Pope Pius XII ever called him that. To everybody in the neighborhood he was Patsy. He was 5-feet-6 and weighed 300 pounds. He sat outdoors on a big chair in front of the rectory at night and smoked cigarets and gabbed with passersby and sent local kids like Tony Fauci to the candy store to buy him ice cream. Patsy Barilla was a legend in the old neighborhood, and now one of his former errand boys is George Bush's hero. Life sure takes some interesting twists.

Msgr. Al Varriale and Joe Torregrossa and Frankie Dee and others from the old neighborhood still remember Tony Fauci, George Bush's hero, with affection and respect. Though small, Tony was an excellent basketball player. "A real pepperpot, very kinetic, good at stealing the ball, quick as a wink," says Msgr. Varriale, coach of the parish teams in the 1950s, now retired pastor of nearby Our Lady of Guadalupe. Joe Torregrossa, who has lived more than 60 years on 82d and 14th, was the parish baseball coach. Tony was his shortstop. "Tony was always a good boy, and a great competitor," remembers Joe. "He was never late for practice."

The Faucis were a model family. Mr. Fauci and Father Al formed the Catholic Pharmacists Guild, a spiritual and professional association. Mrs. Fauci was active in the parish Rosary Society. Tony's sister helped out afternoons in the rectory. The family went to church together. Everyone in the neighborhood liked and respected the Faucis. They were the kind of people who made Brooklyn the Borough of Homes and Churches.

IN THE AUGUST ISSUE of Current Biography magazine, Dr. Anthony Fauci got a glowing write-up for his tireless work in AIDS research. "You can't match the excitement of knowing you're doing something for humanity," he says in the piece. Asked his personal motto, he replies, "Always strive for excellence." Dr. Fauci is a husband and father now, and a brilliant physician, but he remembers where he came from, saying, "I had a very happy, typical New York childhood." He fetched Patsy Barilla's ice cream, and he grew up to be George Bush's hero.

Experts to Review AZT Role As the Chief Drug for H.I.V.

By LAWRENCE K. ALTMAN

WASHINGTON, Sept. 16 — After years of recommending AZT as the first-line drug for treating the virus that causes AIDS, Federal health officials are considering a change because of surprising results with other drugs.

Dr. Anthony S. Fauci, the director of the National Institute of Allergy and Infectious Diseases, said in an interview that he planned to convene a meeting where independent experts could decide whether AZT should remain the first choice.

A large study paid for by Dr. Fauci's institute and reported this week found that AZT was less effective than another drug, didanosine, or ddI, and also less effective than combinations of AZT with either ddI or zalcitabine, known as ddC.

One part of the study showed that ddI lowered the rate of death from H.I.V. infection to 5 percent from 10 percent when compared with the use of AZT alone over 147 weeks.

The study provided the first conclusive evidence that a drug could reduce the risk of death in symptomless people who are at an intermediate stage of infection with H.I.V., Dr. Fauci said.

Two similar independent studies are due to be completed by January. One is being conducted in the United States, the other in Europe and Australia.

Dr. Fauci said he would ask the meeting of experts to review the findings of all three studies and consider whether a change in recommendations for the treatment of H.I.V. was needed.

Two AIDS experts who participated in the study that was reported this week, Dr. Paul Volberding of San Francisco General Hospital and Dr. Fred T. Valentine of New York University Medical Center, joined Dr. Fauci in calling the findings important.

David Barr, the director of treatment education at the Gay Men's Health Crisis in New York City, said that "the way ddI stands out has taken everyone by surprise."

Surprising new findings lead to plans for a meeting of AIDS specialists.

"It suggests," Mr. Barr said, "that ddI is a better single drug to start with than AZT. But it does not answer the question whether ddI is better than nothing."

Indeed, Dr. Fauci and other experts confirmed that ddI had never been compared with a placebo in a large study, even the one now being reported, whereas AZT had proved better than a placebo in earlier studies.

Mr. Barr said the Gay Men's Health Crisis would withhold judgment on the new study's findings until completion of an independent statistical analysis. New calculations are needed, he said, because of the large amount of data involved in the study and his organization's concern that problems had arisen with statistical analyses of earlier federally sponsored studies.

One point of concern, Mr. Barr said, is the unusually large dropout rate — 53 percent of the 2,500 people who began as subjects in the study did not complete it — and that rate's effect on the statistical power of the study.

Federal health officials said the high dropout rate reflected adverse reactions to the drugs, disease progression and the study's demands on patients. A Federal analysis said that "the premature withdrawal rate may have diluted the power to detect differences but does not appear to have negated the results and conclusions."

The study was carried out at 52 medical centers in the United States. It involved infected patients whose immune system had been moderately impaired by H.I.V. and who had CD4 counts from 200 to 500. CD4 cells are the prime target of H.I.V., and CD4 counts are a standard measure of immune system function. The normal count is 800 to 1,200.

The participants were randomly divided into four groups, which received AZT alone, ddI alone, a combination of ddI and AZT, or a combination of ddC and AZT.

Added evidence that combinations of drugs may be best.

AZT was less effective than each of the three other treatments in preventing death, progression of infection to AIDS and significant drops in the CD4 count.

The three favorable treatments were similar in effectiveness and side effects, according to the preliminary findings, which will be reported in San Francisco on Monday at the Interscience Conference on Antimicrobial Agents and Chemotherapy.

The Gay Men's Health Crisis is advising callers to take their questions to doctors, Mr. Barr said, because the differences in reported benefits "are not that great that somebody should be immediately changing what they do."

"It is going to take some time to sort out this information and to figure out what it means," he said.

Although the three studies that the panel of experts will review are not identical, Dr. Fauci said, they and some earlier studies are similar enough for common threads to be detected. The European-Australian study involves 3,300 symptomless infected patients with fewer than 350 CD4 cells. The second American study involves 1,100 patients with fewer than 200 such cells.

Until the expert committee makes its recommendations early next year, Dr. Fauci said, data from the study reported this week suggest that a patient's prior experience with AZT can guide a doctor's choice.

Of the participants, 57 percent had taken AZT before entering the study, and 43 percent had not. Although all three other treatments in the study fared better than AZT alone, among participants who had never taken AZT the most significant benefit was found in those who received the combination of ddC plus AZT.

In contrast, among patients who had taken AZT before, the best results were seen in those who took either ddI alone or ddI plus AZT.

The findings should lead scientists to focus on developing improved combinations of anti-H.I.V. drugs, Dr. Fauci said.

For instance, recent studies have shown favorable results from a combination of AZT and a drug called 3TC. And with AIDS experts hailing the promise of a new class of drugs known as protease inhibitors, studies of different combinations may demonstrate substantially increased benefits, Dr. Fauci said.

2008 - Father Stephen Fauci passes

https://newspaperarchive.com/stephen-fauci-obituary-311060360/

stephen fauci

FAUCI--Stephen A., on May 13th, 2008. Much loved for his kindness and sense of humor. Graduated Columbia School of Pharmacy, ran a neighborhood drug store in Brooklyn and worked at Memorial Sloan-Kettering Pharmacy. His wife Eugenia passed away in 1965. Survived by his daughter Denise Scorce, his son Dr. Anthony S. Fauci, five grandchildren and three great-grandchildren. Mass Friday, May 16th at 10am, St. Catherine of Siena Church, 411 East 68th St., NYC. Burial at Green-Wood Cemetery.

Born December 24, 1940) is an American physician and immunologist who has served as the director of the National Institute of Allergy and Infectious Diseases (NIAID) since 1984. Since January 2020, he has been one of the lead members of the White House Coronavirus Task Force addressing the 2019–20 coronavirus pandemic in the United States.

As a physician with the National Institutes of Health (NIH), Fauci has served American public health in various capacities for over 50 years. He has made contributions to HIV/AIDS research and other immunodeficiencies, both as a scientist and as the head of the NIAID at the NIH. *The New York Times* called Fauci "the nation's leading expert on infectious diseases".[1]

Director of the National Institute of Allergy and Infectious Diseases **Assumed office** November 2, 1984

President Ronald Reagan, George H.W. Bush, Bill Clinton, George W. Bush, Barack Obama, Donald Trump

Preceded by Richard M. Krause

Anthony Stephen Fauci

December 24, 1940 (age 79)

New York City, U.S.

Spouse(s)

Christine Grady (m. 1985)

Children 3

Education College of the Holy Cross (BA) / Cornell University (MD)

Awards Maxwell Finland Award (1989) / Ernst Jung Prize (1995) / Lasker Award (2007) / Medal of Freedom (2008) / Robert Koch Prize (Gold, 2013)

Fauci was born December 24, 1940, in Brooklyn, New York City, to Stephen A. Fauci and Eugenia A. Fauci, owners of a pharmacy. His father worked as the pharmacist, his mother and sister worked the register, and Fauci delivered prescriptions. The pharmacy was located in the Dyker Heights section of Brooklyn, one neighborhood away from his family home in Bensonhurst.[2]

Fauci's paternal grandparents, Antonino Fauci and Calogera Guardino, were from Sciacca, Italy. His maternal grandmother, Raffaella Trematerra, from Naples, Italy, was a seamstress. His maternal grandfather, Giovanni Abys, was born in Switzerland and was an artist, noted for landscape and portrait painting, magazine illustrations (Italy) as well graphic design for commercial labels, including olive oil cans. His great-grandparents emigrated to the US in the late 19th century. Fauci grew up Catholic.[2][3][4]

Fauci attended Regis High School in Manhattan's Upper East Side, where he captained the school's basketball team and graduated in 1958.[5][6] He then went to the College of the Holy Cross, graduating in 1962 with a Bachelor of Arts in classics. Fauci then attended medical school at Cornell University Medical College where he graduated first in his class with a Doctor of Medicine in 1966.[2] He then completed an internship and residency at the New York Hospital-Cornell Medical Center.[6]

Career

Fauci discusses his work in 2020 (4 minutes)

In 1968, Fauci joined the National Institutes of Health as a clinical associate in the Laboratory of Clinical Investigation (LCI) at the National Institute of Allergy and Infectious Diseases.[7] In 1974, he became Head of the Clinical Physiology Section, LCI, and in 1980 was appointed Chief of the Laboratory of Immunoregulation. In 1984, he became director of NIAID, a position he still holds as of 2020.[1] In that role he has the responsibility for an extensive research portfolio of basic and applied research on infectious and immune-mediated illnesses.[7] He has turned down several offers to lead his agency's parent, the NIH, and has been at the forefront of US efforts to contend with viral diseases like HIV, SARS, the 2009 swine flu pandemic, MERS, Ebola and severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2).[8]

He played a significant role in the early 2000s in creating the President's Emergency Plan for AIDS Relief[9] and in driving development of biodefense drugs and vaccines following the 9/11 terrorist attacks.[10]

Medical achievements

President Bill Clinton visits the NIH in 1995 and hears about the latest advances in HIV/AIDS research from Fauci

Fauci poses for a photo with President George W. Bush in 2007

Fauci has made important scientific observations that contributed to the understanding of regulation of the human immune response, and is recognized for delineating the mechanisms whereby immunosuppressive agents adapt to that response. He developed therapies for formerly fatal diseases such as polyarteritis nodosa, granulomatosis with polyangiitis, and lymphomatoid granulomatosis. In a 1985 Stanford University Arthritis Center Survey of the American Rheumatism Association, membership ranked Fauci's work on the treatment of polyarteritis nodosa and granulomatosis with polyangiitis as one of the most important advances in patient management in rheumatology over the previous 20 years.[11][12]

President Barack Obama greets Fauci in June 2014

Fauci has contributed to the understanding of how HIV destroys the body's defenses leading to the progression to AIDS. He has outlined the mechanisms of induction of HIV expression by endogenous cytokines.[12] Fauci has worked to develop strategies for the therapy and immune reconstitution of patients with the disease, as well as for a vaccine to prevent HIV infection. His current research is concentrated on identifying the nature of the immunopathogenic mechanisms of HIV infection and the scope of the body's immune responses to HIV.

In 2003, the Institute for Scientific Information stated that from 1983 to 2002, "Fauci was the 13th most-cited scientist among the 2.5 to 3 million authors in all disciplines throughout the world who published articles in scientific journals".[6]

Ebola Congressional hearing

See also: Ebola virus cases in the United States

On October 16, 2014, in a United States Congressional hearing regarding the Ebola virus crisis, Fauci, who, as the director of the National Institute of Allergy and Infectious Diseases (NIAID) had been discussing the importance of screening for weeks,[13] testified that NIAID was still some distance away from producing sufficient quantities of cures or vaccines for widespread trials.[14] Specifically, Fauci said "While NIAID is an active participant in the global effort to address the public health emergency occurring in west Africa, it is important to recognize that we are still in the early stages of understanding how infection with the Ebola virus can be treated and prevented."[14]

Fauci also remarked in the hearing: "As we continue to expedite research while enforcing high safety and efficacy standards, the implementation of the public health measures already known to contain prior Ebola virus outbreaks and the implementation of treatment strategies such as fluid and electrolyte replacement are essential to preventing additional infections, treating those already infected, protecting healthcare providers, and ultimately bringing this epidemic to an end."[14]

COVID-19 task force

Fauci speaks to the White Housepress corps on COVID-19 in March 2020

Fauci is a member of the White House Coronavirus Task Force established in late January 2020, under President Trump, to deal with the coronavirus pandemic.[15][16] He said that the final case fatality rate of those who are infected will likely be closer to 1% than the 2% initially estimated by the World

Health Organization, which is ten times the 0.1% reported rate for seasonal flu.[17][18][19]

Fauci has been a "de facto" public health spokesperson for the office of the President during the pandemic[20] and strong advocate of ongoing social distancing efforts in the United States. He argued for the extension of the initial 15-day self-isolation guidelines, issued by the executive office, to at least until the end of April 2020.[21] Due to his disagreements with Trump, Fauci has been criticised by right-wing pundits and received death threats that resulted in the need for a security detail.[22][23][24] While there have been disagreements, Trump has also praised Fauci.[25][26][27]

Memberships

Fauci is a member of the National Academy of Sciences, the American Academy of Arts and Sciences, the National Academy of Medicine, the American Philosophical Society, and the Royal Danish Academy of Sciences and Letters, as well as other numerous professional societies including the American Society for Clinical Investigation, the Infectious Diseases Society of America, and the American Association of Immunologists. He serves on the editorial boards of many scientific journals; as an editor of *Harrison's Principles of Internal Medicine*; and as author, coauthor, or editor of more than 1,000 scientific publications, including several textbooks.[28]

Personal life

Fauci married Christine Grady, a nurse with the NIH, in 1985, after meeting while treating a patient. Grady is chief of the Department of Bioethics at the National Institutes of Health Clinical Center. The couple has three adult daughters: Jennifer, Megan, and Alison.[29]

Awards and honors

Ben Carson and Anthony Fauci (right) being announced as recipients of the Presidential Medal of Freedom at the White House on June 19, 2008.

- 1979: Arthur S. Flemming Award[30]
- 1995: Ernst Jung Prize (shared with Samuel A. Wells, Jr.)[31]
- 1996: Honorary Doctor of Science, Colgate University, for pioneering observations of human immune response and pursuit of an AIDS vaccine[32]
- 1999: Honorary Doctor of Public Service Degree, Shippensburg University of Pennsylvania
- 2002: Albany Medical Center Prize[33]
- 2003: American Academy of Achievement's Golden Plate Award [34]
- 2005: National Medal of Science[35]
- 2005: American Association of Immunologists Lifetime Achievement Award[36]
- 2007: Mary Woodard Lasker Public Service Award[37]
- 2007: George M. Kober Medal, Association of American Physicians[38]
- 2008: Presidential Medal of Freedom[34]
- 2013: Robert Koch Gold Medal[39]
- 2013: Prince Mahidol Award[40]
- 2016: John Dirks Canada Gairdner Global Health Award[41]

Fauci has been a visiting professor at many medical centers, and has received 30 honorary doctorate degrees from universities in the United States and abroad.[28]

1989 - "In their own words" - Interview by National Institute of Health of Dr. Anthony Fauci

Source - [HG003K][GDrive] and [HG003L][GDrive]

This is an interview with Dr. Anthony S. Fauci, Director of the National Institute of Allergy and Infectious Diseases), in his office at the National Institutes of Health, in Bethesda, Maryland, on March 7, 1989. The interviewer is Dr. Victoria Harden, Director of the NIH Historical Office.

Harden: Dr. Fauci, could you begin by describing the home in which you grew up, your parents, your grandparents and siblings; what you enjoyed doing as a boy, and your elementary and secondary education?

Fauci: I was born in Brooklyn, New York. My grandparents on both my mother's and father's side were born in Italy, except for my grandfather on my mother's side, who was born in Switzerland. They came to the United States at the end of the nineteenth century. Both my parents were born in New York City and went to public schools in New York City. My father, Stephen Fauci, graduated from the College of Pharmacy, Columbia University, as a pharmacist. My mother, Eugenia Fauci, went to Brooklyn College and Hunter College. They married very young, when they were eighteen years old, and went to college after they were married, while they were still growing up. I went to the neighborhood parochial schools in New York City. I was brought up in a Catholic grammar and high school environment. I went to Our Lady of Guadeloupe Grammar School in Brooklyn and to Regis High School, a Jesuit high school in Manhattan. I had the interesting experience of having to take a bus and three separate subway trains to get from my home in Brooklyn to high school in Manhattan. I believe that my childhood was a typical, very happy, and very active growing-up period in New York City during the early forties. I was born in December of 1940 in New York City and grew up as a child in the World War II and post World War II years.

My major interest was sports. I lived in a very sports-oriented neighborhood. We used to play basketball from the beginning of the basketball season to the end, baseball throughout the spring and the summer, and then basketball and football again in the winter. My sister, who is three years older than I, also went through the same sort of school system, same grammar school I went to, went to an all-girls' Catholic high school, and ultimately St. John's University in New York City. She was a teacher before she stopped to raise her family.

Harden: Who were your boyhood heroes?

Fauci: My boyhood heroes were predominantly sports figures like Joe Di Maggio, Mickey Mantle, and Duke Snyder. I was unusual in that I grew up in Brooklyn but was a New York Yankees fan. I was somewhat of a sports outcast among my friends who were all Brooklyn Dodgers fans. This was the time the Dodgers were actually located in Brooklyn as opposed to Los Angeles, where they are currently located.

Harden: How did a young man who was devoted to sports decide to become a physician?

Fauci: I don't think I can tell you the precise time when I knew that I wanted to be a physician. It was very early on. I know that in high school, when I was deciding the options I would have in college, there really was no question that I was going to be a physician. I went to Regis High School, a Jesuit high school, which had a major impact on my career even up to today. It was a highly academic, exclusive scholarship school. Students from every parochial grammar school in all the five boroughs of New York competed to receive admission, making it highly competitive, and the courses were extraordinary. They were very heavily weighted towards the classics. We took four years of Greek, four years of Latin, three years of French, ancient history, theology, etc. When I was at Regis, it seemed that the very bright people in school really had just a few options. If you wanted to go into medicine, that was fine. The other choices were law, science, engineering, or careers like that. My interest in medicine stems from my keen interest in people, in asking questions and solving problems.

Also, I think there was subliminal stimulation from my mother, who, right from the very beginning when I was born, wanted me to be a physician. She never really pressured me in any way, but I think I subtly picked up the vibrations that she wanted very much for me to be a physician. When the time came to go to college, I went to Holy Cross College, which has an extraordinarily fine reputation for premedical work. They do it in a very interesting way, at least it seemed so back in the fifties. I went to Holy Cross in 1958 and graduated in 1962. At that time, it was not unusual for premedical students to take a very strong classics course in premed. The title of my premed course was “A.B. Greek Premed,” which was a classics course very heavily weighted with philosophy–32 credits of philosophy, plus French, Greek and Latin. At the same time we took the minimal scientific courses to get us into medical school. The students did very well, getting into the best medical schools in the country but with a very strong liberal arts background. The liberal arts background is something that was very much a part of my family because virtually all of my relatives on my mother's side–her father, her brother, and her sister's children–are all artists. They are successful people who made their living through the arts, usually painting. I was always and still am very interested in art, but I am somewhat of a frustrated artist because I certainly don't have the time, and probably not the talent either, to pursue it. I still am very interested in the classics. They were a very important part of my education.

Harden: Would you evaluate the broad, liberal arts, humanistic training and your Catholic upbringing in terms of how they have influenced your performance as a physician and as a researcher? I'm thinking of things like your world view, your interaction with patients, and your approach to ethical questions.

Fauci: You can't separate very well natural abilities in a vacuum from your training, or from the combination of factors that have an influence on how you perform. But certainly, the humanistic education that I had has had a very positive influence on my ability to deal with sensitive situations with people. I credit very much the Jesuit training in precision of thought and economy of expression in solving and expressing a problem and in the presentation of a solution in a very succinct, accurate way. This has had a major, positive influence on the fact that I enjoy very much and am fairly good at being able to communicate scientific principles or principles of basic and clinical research without getting very profuse and off on tangents. This is something that was drilled into us from the very early days in high school.

Harden: Did you continue your interest in sports in college?

Fauci: My interest in it continued, but not my active participation. In high school, I played competitive sports–I played basketball at a time when you could play basketball without being 6'9" at the shortest. I don't think I would have any chance of playing basketball if I were in high school now. I enjoyed basketball, was the captain of the team and had a very successful time in high school. Alongside it, I played baseball. These were my two major sports. When I went to college, I continued to play a modest amount of intramural sports, but due to the nature of the premedical curriculum at Holy Cross, it was very difficult to be very active in sports. I did not play competitive basketball or even baseball at the college level, since they had very good teams. I could not play as much as I wanted to because the demands of the curriculum were such that you really had to put a lot of time into your studies.

Harden: Could you talk about your experiences at Cornell University Medical College and comment on how actually becoming a doctor compared to your earlier conceptions of the profession?

Fauci: This might be interpreted by some as being paradoxical, but I absolutely loved medical school. It certainly was demanding, but it was one of the most exciting experiences of my life. The exponential curve of knowledge accrual in medical school was so great that it completely overshadowed the fatigue and the stress factors and the other problems that are so commonly seen in medical school. Certainly, medical school training was very stressful, but unquestionably it ranked as one of the happiest periods of my life, because I was learning so much. The later years in medical school and in health care training and what had been my previous idealistic views about medicine did fit together. There really was the opportunity to apply a very basic scientific framework of knowledge to something that is very human, very personal, with all of the sensitivities associated with dealing with human beings. Here I had the advantage of the humanistic training that I had received earlier on in high school and in college. This is a nice dichotomy of medical school, and that's why I think that there is no question that I was meant to be a physician and a physician-scientist. I can't imagine in my wildest dreams doing anything else that would make me as happy as this makes me. I enjoy the polarity. There are strict scientific principles that have to be adhered to in medicine. At the same time a humanistic touch is needed in dealing with people. They have to be combined. You have to combine social aspects, ethical aspects, personal aspects with cold, clean science. It is the art of the physician to put them together in the care of a patient, in the development of a protocol for a disease, the diagnosis or treatment of a problem. This combination exists in every aspect of patient-involvement.

Harden: Who influenced you the most during medical school, especially in your decision to go into immunology?

Fauci: The people who influenced me most in medical school are different from those who influenced my decision to go into immunology. Taking medical school first: My heroes were the strict clinicians of the New York Hospital/Cornell Medical Center. They were and still are in so many respects the real heroes. My teachers, whom I saw on the wards as a student and during my internship and residency, were people whose entire lives were devoted to clinical medicine. They reached such levels of expertise in patient care, diagnosis, and the delivery of patient care that they were really super stars. I tried to emulate them and make myself as good a clinician as I possibly could be. They provided a great inspiration. I think that it is very important for a young medical student to have a role model. There were several of them around at the time.

The reasons I went into immunology and research in general were due to an unusual situation. I left Cornell and went into my internship and residency in 1966. That was at the exponential phase of the Vietnam War, and every single physician went into military service. I can remember very clearly when we were gathered in the auditorium at Cornell early in our fourth year of medical school. Unlike today, we had only two women in the class and seventy-nine men. The recruiter from the Armed Forces came there and said, "Believe it or not, when you graduate from medical school at the end of the year, except for the two women, everyone in this room is going to be either in the Army, the Air Force, the Navy or the Public Health Service. So, you're going to have to take your choice. Sign up and give your preferences." I had heard about the NIH and the opportunity there. At the time, the NIH was just blossoming, and everyone who had any role in academic medicine spent some time at the NIH. So I put down Public Health Service as my first choice, and then the Navy. Essentially, I came down to the NIH because I didn't have any choice. I was very lucky because I knew that it was a phenomenal scientific opportunity.

When I was trying to decide what laboratory to go to, some of my advisers at Cornell suggested very strongly that I pursue the field of immunology, since I had developed an interest in immunology in medical school. I had done some projects during the summer and had worked for a period with Dr. Marvin Schlesinger, who was the chief of gastroenterology division of the Department of Medicine. I also had worked with [Dr.] Graham Jeffries and [Dr.] Walter Rubin. The project I did as a student turned out to be a successful project. I was lucky, since that doesn't usually happen when you have a student project. Because of this research, I applied for the National Institute of Allergy and Infectious Diseases. It so happened that Dr. Schlesinger knew Dr. Sheldon Wolff at the NIH, and I came down to the NIH for an interview. I was interviewed by Dr. Wolff, and I immediately fell in love with the man. He was just my kind of person–intellectually and personally. I was accepted by Dr. Wolff right off. At the end of my residency, I came down to the NIH to work in the National Institute of Allergy and Infectious Diseases with Dr. Wolff. Over the years, even after he left the NIH, he emerged as the major mentor–personal and scientific–in my life. There have been a number of other individuals whom I have come into contact with who have had a major influence on me, but I think that Dr. Wolff clearly stands out as the person who made the greatest impact on my career.

Harden: Could you talk about the research you did with Dr. Wolff in his laboratory in this period?

Fauci: When I came down to what was the Laboratory of Clinical Investigation, of which Dr. Wolff was the laboratory chief as well as being the clinical director of the National Institute of Allergy and Infectious Diseases, I wanted to work on cellular immunology. But, interestingly enough, as popular as cellular immunology is now, there really were not very many cellular immunologists at the time, and certainly not in the Laboratory of Clinical Investigation. I went to work with Dr. John Johnson, who now practices rheumatology in Nashville, Tennessee. John was an immunochemist at the time, but he allowed me to work on problems in cellular immunology. I had to go around to different groups in different laboratories to learn the fundamentals of cellular immunology under the auspices of the Laboratory of Clinical Investigation. It was a great experience and a testimony to the flexibility of people like Dr. Wolff and Dr. Johnson, who allowed me to work in that field even though it wasn't their field of expertise. Dr. Wolff was mainly working on the pathogenesis of fever. I told him I didn't want to work on that, although it was a very interesting topic. I wanted to learn some basic cellular immunology with the ultimate aim of going into what has been my theme for the past twenty-one years–human immunobiology and the regulation of the human immune system. I was then, and still am, extremely interested in clinical medicine, and I have been successful in being able to mix and meld together the very fundamental, basic concepts of immunology with clinical medicine. It was Dr. Wolff who encouraged me. I worked on some projects looking at the regulation of the immune system in animals, with rabbit and guinea pig models. I learned from Dr. Baruj Benacerraf, who was down the hall in the Laboratory of Immunology; from [Dr.] David Katz, who worked with him; and from [Dr.] Carl Pierce and a few others. There were in the laboratory working with Dr. Johnson two people who have gone on to be very successful and prominent immunologists–[Dr.] Alexander Lawton, who is now at Vanderbilt [University] and chairman of pediatrics, and [Dr.] Herbert Reynolds, who is now chief of medicine at the Hershey Medical Center of the Pennsylvania State University. They were just Fellows with me at the time, and we taught each other immunology. However, though I liked it very much, my main desire was to get back to the New York Hospital/Cornell Medical Center and to be a clinician. That's what I really wanted to do. I liked the scientific environment, but my real love was taking care of patients.

Harden: Why did you go back to Cornell for another year, and what made you decide to come back to the NIH and pursue your career here rather than going

on into a private practice or into academic medicine?

Fauci: I was at that very critical period in my second year as a Fellow in a three-year program having to make up my mind about what I was going to do "for the rest of my life." Just about at that time things started to click in the laboratory. I was making some interesting observations, writing some papers that were turning out to be good papers. Virtually simultaneously, [Dr.] Alexander Bearn, who was the chairman of the Department of Medicine at Cornell at the time, asked me if I wanted to come back at the end of my third year to be chief resident in medicine. At the same time, Dr. Wolff offered me a job, which was one of those offers that you can't refuse. It was the position of senior investigator in the Laboratory of Clinical Investigation. I told him I wanted to go back and have another year in clinical medicine and make myself as excellent a clinician as I possibly could. His response was, "Fine, go back to New York; take a year as chief resident, and then come back; the laboratory will be waiting for you when you get back." I made the decision, but when you make decisions like that, you're not really sure why you made them. I think it was a combination of the personality of Dr. Wolff, with whom I was developing a very strong friendship, and the fact that as the months were going by, my immunology research was becoming more successful. I didn't feel that I was giving up anything because I was going back to New York to cement my clinical training. I decided that I would do it. I would go back to New York and come back to NIH after a year to my own laboratory, in which I would have total independence. I think it is important to emphasize that quality of Dr. Wolff that has been responsible for the development of so many successful investigators over the years. It is important to recognize what he did with me as with many others. He could recognize early on in someone's career a person who had potential, who would succeed. Before that person did anything to make any kind of reputation, Dr. Wolff would give that person unqualified support. That was exactly what he did for me. Nobody knew who I was; nobody cared to know who I was. But Dr. Wolff said, "Here's your laboratory. You can have a technician. You can have a Fellow if you can attract a Fellow. So go ahead." I said, "Fine, that's great." I went to New York, came back to the NIH and started my own human immunobiology group. I was one of the few people at the time anywhere who was devoted exclusively to human immunobiology. There was [Dr.] Max Cooper in Alabama and Tom [Dr. Thomas] Waldmann at the NIH. Bob [Dr. Robert] Good and a few others were exclusively human. There were many excellent and great immunologists around who did either totally animal work or a combination of animal and human, but there were very few who were doing exclusively human immunobiology. That's when I started my work on immunoregulation of the human immune response, which I have continued throughout the past couple of decades. I am still working on it right now in 1989.

Harden: Your medical student years and just after marked the period of time when cellular immunology began to flower. Would you comment on what factors made immunology such a fruitful field?

Fauci: It was a combination of the emergence of technologies and the awareness of the extraordinary implications, if not tentacles, that the immune system had in controlling so many aspects of the human organism. For example, technology provided the ability to identify different types of cells and their subsets. There was the realization of the almost infinite possibilities of a repertoire of B-cells to recognize different antigens. The development of monoclonal antibodies and the ability to clone cells led to a virtual explosion in the delineation of the immune system, its structure and its function.

At the same time, scientists became aware that there were many immunologically mediated diseases. Diseases that were total mysteries years ago became understood as immune-mediated: lupus, rheumatoid arthritis, the connective tissue diseases, the organ-specific autoimmune diseases, and transplantation rejection are a few examples. This was also occurring during the emergence of molecular biology within the field of immunology. If you look at immunology, it has from the very beginning been inextricably linked to infectious diseases. Teleologically, what is the immune system for? The immune system protects you against invaders from without–microorganisms–as well as, in some cases, the emergence of certain tumors from within.

What was not realized until that period of explosive interest is that the immune system is an organ system just like any other system. It is an organ system like the cardiovascular system, the neurological system and the endocrine system. Initially, it was understood to be a response that the body had, but now, the immune system is viewed as a true organ system. It has structural components: there are lymphocytes; there are organs, such as the spleen; the blood is a lymphoid organ. The reticuloendothelial system, the bone marrow, the thymus and the lymph nodes are all parts of the immune system. This organ system has a way of communicating by a variety of soluble factors which we call cytokines. Knowledge about this has just emerged over the past decade. There are a large number of different molecules that have very specific functions, such as one cell's ability to talk to another cell. All of this started to emerge as the technology was developed that allowed the precise identification of the components of the immune system and their function.

Harden: Cell sorters, for example, were essential to this.

Fauci: Absolutely.

Harden: Some of the basic research in other fields, the work on protein chemistry and protein structure, for example, also facilitated the advances in immunological knowledge, I believe. It appears to be one of those "payoffs."

Fauci: Absolutely. I think immunology, certainly is one of the major examples of something that we stress very often. Basic, fundamental undifferentiated research will inevitably, sooner or later, emerge into something that is very important; but very likely you would not have predicted that it would relate to this particular arena. You're working in one direction and then all of a sudden you find something else that you don't understand now, but ten years from now it solves problems in another direction. Immunology and basic research on the immune system really provide a classic example of this.

Harden: The 1956 research by [Bruce] Glick, [Timothy S.] Chang, and [R. George] Jaap on the bursa of Fabricius and antibody production in poultry seemed so far outside the mainstream of human immunology, if I remember correctly, that it could only be published in the journal, Poultry Science. Later, it turned out to be very important. Could you talk about your own work on Wegener's granulomatosis and some of the other problems to which you applied your knowledge?

Fauci: My research career at the NIH emerged in two parallel tracks. One was the very fundamental dissection of how the human immune system is regulated. The other parallel track was an examination of immune-mediated diseases and how one can classify and treat them. The work on the regulation of human immune system is what led me into AIDS research. What we performed in the late sixties and early seventies were probably "breakthrough" studies on the development of cures for formerly fatal diseases such as Wegener's granulomatosis and polyarteritis nodosa. Things emerged from those interesting quirks of science, things that you never would have predicted. Dr. Wolff, even before I came to the NIH, had been very interested in immunosuppression, such as some of the cytotoxic agents. His major interest was fever. This is really very interesting, a story that I tell the Fellows when they come. It is the classic example of how science is so beautiful because it is so unpredictable. Dr. Wolff had collected over the years–he had been at NIH for at least five or more years before I got there–a group of patients with prolonged fevers of unknown origin, not just five or six weeks, but a year long at least. He had a heterogeneous group of people which numbered literally in the hundreds. He had been collecting them for a few years because he wanted to study the pathogenesis of fever. Some of them had granulomatous hepatitis, a disease that had never before been described and that he described. Some of them had juvenile rheumatoid arthritis; some of them had connective tissue diseases; some of them had hematologic diseases; and others had immune-mediated vasculitic diseases. They were a very interesting group of patients–interesting because the diseases were interesting but also because most of them would die from their diseases–particularly those with Wegener's granulomatosis.

At that time, I came as a Fellow and I wanted to stay involved in some clinical work while I was doing basic research in the laboratory. This is essentially what I'm doing now–doing clinical work while I'm doing very fundamental cellular and molecular work in the laboratory. I asked him, “Could I start collecting these Wegener's and vasculitic patients and put them on a set protocol, and look at these cytotoxic agents, particularly cyclophosphamide”? I was interested in this because the agent had been used successfully in one or two patients in a manner that was not very well organized since it was given to a patient as a last resort. Dr. Wolff, as usual, was extremely accommodating, and said, “Fine. I'll support you on that. Let's do it. We'll do it together and I'll help you out.”

To make a long story short, we started a protocol that gave cyclophosphamide in low doses. Previously it had been developed as an anticancer drug and was given predominantly to individuals with leukemia in very high doses that would wipe out the bone marrow. We figured from animal studies, particularly those performed by investigators such as Bob [Dr. Robert] Schwartz and others in Boston, that low doses of a cytotoxic agent could suppress the immune system without wiping out the bone marrow. We then did something that was very unorthodox. We gave low doses of this cytotoxic agent, equivalent to the amount that in animals suppressed immunological function but didn't cause very severe toxic side effects like neutropenia.

The disease that we targeted at first was Wegener's granulomatosis. The cytotoxic agent completely shut off the disease, so much so that we've now treated over the years hundreds of patients with Wegener's granulomatosis, and the disease is essentially curable. We now have a 93% remission rate, whereas when I came to the NIH in 1966, 100% of the patients died. We have fine-tuned the regimen now, writing and informing physicians that if the dose is maintained at a level that keeps the white count above a certain level, then there will be very little trouble with secondary infection. If the patient is simultaneously treated with alternate-day prednisone as opposed to daily prednisone, which has toxic side-effects, infection will be largely avoided. So, the combination of alternate-day prednisone with daily low-dose cyclophosphamide essentially was responsible for essentially curing Wegener's granulomatosis, or at least putting it into prolonged remission.

Once it became clear from the first several patients that it worked with Wegener's, we then tried it with similar diseases–polyarteritis nodosa, cerebral vasculitis, lymphomatoid granulomatosis and Takayasu's arteritis. We had a series of seven or eight diseases that formerly were completely fatal but now people were coming to the hospital, and four to six weeks later, they were walking out and going back to their jobs. It was a heady and exciting period of time–both clinically and in research. At the same time we were looking at regulation of the human immune system at the very basic level, which emerged in the 1970s from cellular phenomenological research to work at the molecular level.

Harden: It must have been very gratifying to achieve such results.

Fauci: It was gratifying not only because I could do some good but because I actually saved the lives of some people. That is the epitome of what you want to do in medicine. I've always wanted to be involved with diseases that were very, very serious. I would rather be involved with patients who have fatal diseases than those with diseases that are just an annoyance. That just happened to be my bent. I wanted to be where the action was. So there it was, we had a disease that was formerly fatal and we made a major impact on it. The other thing that was so gratifying about that experience was that we were able to do something that people said you can't do–you can't do clinical medicine at the same time that you do very basic research. That is absolutely incorrect, if you organize your time correctly. If you ask the right questions, get the right training, you can do work that is very, very basic in its approach and yet has important clinical consequences.

Harden: In our next interview I want to examine how you as a clinical immunologist responded to the first cases of AIDS that you saw. But, before we stop today, I want to pose a hypothetical question. If AIDS had struck in 1955, before we knew about T-cells and other aspects of the immune system, how do you think the medical community would have responded to it?

Fauci: I think it would have been much more frightening than it is now, and it is frightening now. I think we would not have had a clue as to how to combat this disease from a basic scientific standpoint. I think we would have realized just on epidemiological grounds that it was an infectious agent of some sort that was sexually transmitted and transmitted by blood. But about pathogenic mechanisms, we wouldn't have had a clue. We wouldn't have known how even to go about thinking about the virus, much less clone it and develop drugs against it. So within the framework of the catastrophe of AIDS, we're lucky in the sense that it came at a time when retrovirology, molecular biology, molecular immunology, and immune system studies were at that stage where we could very quickly identify the agent, how it works, the pathogenic mechanisms, its effect on the immune system, etc. If it had happened in 1955, we would have been in very serious trouble.

Harden: Thank you, Dr. Fauci. I look forward to the next interview.

2007 National Institute of Health introduction to Anthony S. Fauci - Association of American Physicians George M. Kober Medal

See - [HG003N][GDrive]

President Ausiello, members and guests of the association: I am very proud to have the honor to introduce this year's George M. Kober medalist, my good friend Anthony S. Fauci, MD.

George Martin Kober lived from 1850 to 1931 and was very active in the Association of American Physicians (AAP), serving as secretary from 1909 to 1917. From "... all accounts [he] ... had great strength of character, loyalty both to persons and principles, together with humility and humanity of high degree" (1). This year's medalist has all these qualities.

Anthony Stephen Fauci — Tony — was born on Christmas Eve, 1940. Headlines in the *New York Times* on that cool and cloudy winter day proclaimed "Churchill Bids Italy Oust Mussolini; Greeks Take Another Coastal Town; Germans Rain Bombs on Manchester." One article touted "Turkey and Fixins in Home only $6.40."

Roots

Tony Fauci's family came from Italy. His maternal grandparents grew up in Naples. His maternal grandfather, Giovanni Abys, was an artist who painted landscapes and portraits, designed labels for commercial products such as cans of olive oil, and did illustrations for Italian magazines. Tony's maternal grandmother, Raffaela Trematerra, was a seamstress.

Tony's paternal grandparents were from Sciacca, Sicily. His grandfather, Antonino Fauci, was from a family who ran a hot springs spa. In Sciacca, he met and married Tony's paternal grandmother, Coligera Guardino.

Both sets of grandparents immigrated to New York City via Ellis Island at the turn of the twentieth century and initially settled in lower Manhattan's Little Italy, where Tony's mom, Eugenia Abys, and dad, Stephen Fauci, were born. Later, both families moved independently of each other to the Bensonhurst section of Brooklyn. Eugenia and Stephen met in eighth grade, attended high school together, and were married one year after graduation. Tony's dad attended Columbia University and became a pharmacist while his mom attended Hunter College. They had two children, first a daughter, Denise, and then a son, Anthony Stephen, who was born in Brooklyn Hospital.

The Faucis ran a neighborhood pharmacy at 13th Avenue and 83rd Street and lived in an apartment above . The whole family helped out in the business — his dad working in the back of the pharmacy while his mother and sister operated the register. Tony delivered prescriptions from the time he was old enough to ride a bike. He was raised in a Catholic tradition, receiving his first communion at age 7 and confirmation at age 12. Strong family relationships were an important part of Tony's upbringing.

Education

Tony was tops in his class at Our Lady of Guadalupe elementary school. He always excelled academically, but he was not a nerd. In the 1950s Bensonhurst was a working-class Brooklyn neighborhood for Italians and Jews. You just didn't talk about your academic achievements. Tony became streetwise, which later would serve him well. He was a strong athlete, playing basketball from fall to spring and baseball from spring to fall at Dyker Heights Park. Tony rooted for the New York Yankees, and his early heroes included Joe DiMaggio and Mickey Mantle. This made him something of an outcast among his friends, who were Brooklyn Dodger fans.

In 1958, he entered Regis High School, a free school on the Upper East Side of Manhattan, with a special mission of educating sons of Catholic immigrants in the Jesuit tradition. The Jesuit philosophy, "*To be men for others*," was an important principle that ran through Tony's education. His high school training emphasized languages and the classics. He took four years of Latin, three of Greek, and two of French. His teachers drilled into him two ideals — precision of thought and economy of expression, qualities he is known for today and instills in the people who work with him.

He continued to pursue his interest in athletics and captained the basketball team. Due to short stature, his career as a basketball player ended early.

At Regis High, it was an accepted fact that if you wanted to become a doctor you went to the College of the Holy Cross. Tony graduated Regis High School among the top in his class and in 1958 entered Holy Cross in Worcester, Massachusetts, where the strong Jesuit influence continued. His undergraduate work mixed classics and philosophy with pre-med courses. This broad academic background groomed the future Dr. Fauci for his destiny as an outstanding physician, scientist, educator, humanitarian, and public health leader.

During college summers, Tony worked on construction crews. Before his final year at Holy Cross he labored on a crew building a new library at Cornell Medical College at 69th Street and York Avenue. At the medical school's centennial celebration in April 1998 he recalled, "On lunch break when the crew were eating their hero sandwiches and making catcalls to nurses ... I snuck into the auditorium to take a peek. I got goose bumps as I entered, looked around the empty room and imagined what it would be like to attend this extraordinary institution. After a few minutes at the doorway, a guard came and politely told me to leave since my dirty boots were soiling the floor. I looked at him and said proudly that I would be attending this institution a year from now. He laughed and said, 'Right kid, and next year I am going to be Police Commissioner'" (2).

In 1962 Tony Fauci did enter Cornell Medical College. He liked Cornell. Each day offered an opportunity to learn something new. He graduated in 1966, first in his class, and pursued house staff training in internal medicine at the New York Hospital.

NIH science

In 1966, during the Vietnam War, he was called to serve. He left New York City for the National Institutes of Health (NIH) to join what was affectionately called the "Yellow Berets" (3). He served his military obligation in the Public Health Service at NIH. He was a Clinical Associate in the program of Sheldon M. Wolff, MD, the Chief of the Laboratory of Clinical Investigation and Clinical Director of the National Institute of Allergy and Infectious Diseases (NIAID) (Figure (Figure4).4). It was during his fellowship at NIH that he completed his training in infectious diseases and in allergy/immunology and began his long, close clinical research partnership and friendship with Wolff.

From 1970 to 1971 he left the NIH to serve as Chief Resident at the New York Hospital Cornell Medical Center. His reputation as Chief Resident was legendary. Many of his house staff and medical students at Cornell became his personal friends, and Tony later recruited several of them to important positions at NIH.

Tony Fauci returned to NIH in July 1971 as a Senior Investigator in the Laboratory of Clinical Investigation and rapidly passed his clinical board examinations in internal medicine, infectious diseases, and allergy/immunology, with top scores. He then began his extensive and uninterrupted career in public service, serving continuously in the government.

I first met Tony in July 1972. He had the lab across the hall from where I worked as a clinical associate. I remember that day well. The two-module lab he entered was a dirty mess with missing equipment. He was quite rattled by what he saw, and I offered to help him clean it up. We have been friends ever since.

That small lab was where Tony's career as a clinical investigator really flourished. He rapidly assembled a strong team focusing on immune regulation. His early studies included demonstrating the therapeutic effect of cyclophosphamide on Wegener's granulomatosis and other vasculitides (4, 5). In 1980, Tony Fauci was made Chief of the new Laboratory of Immunoregulation. A 1985 Stanford University Arthritis Center Survey of the American Rheumatism Association ranked Dr. Fauci's work on the treatment of polyarteritis nodosa and Wegener's granulomatosis among the most important advances in patient management in rheumatology over the previous 20 years (6). And Dr. Fauci was not even a rheumatologist!

A transforming year for the field of infectious diseases — 1981 — had extraordinary impact on global health and Tony Fauci's career. I remember well when the first cases of gay men with unusual opportunistic infections were reported that summer (7, 8). Tony came up to me in the corridor, quite animated, saying how he believed this new disease had the potential to explode into a worldwide catastrophe. He quickly decided to shift the focus of his laboratory to study what would soon be called the Acquired Immunodeficiency Syndrome, or AIDS, a term he helped coin. And that was the beginning of his now historic studies on the pathophysiology of AIDS.

Tony Fauci's laboratory made major observations delineating a model of HIV pathogenesis, and his group's publications in the mid-1980s clearly established what is now considered to be the hallmark functional defect of CD4+ T cells in HIV-infected individuals, a defect in responsiveness to recall antigens. His 1988 publication in *Science* on the pathogenesis of HIV (9) was the most cited paper in medicine in 1989 (10). His group's publications in the early 1990s provided the scientific rationale for the early and aggressive suppression of HIV replication with combination antiretroviral agents. His *Nature* paper in 1993 (11) was the most cited paper in AIDS research from 1993 to 1995 (12). Subsequent papers, considered by many as classics in the field, delineated the link between host-virus interactions and potential targets for therapy (13) and the complex network of host factors involved in the regulation of HIV expression (14). Based on these and subsequent publications, a 2003 Institute for Scientific Information study indicated that for the 20-year period from 1983 to 2002, Tony Fauci was the thirteenth most cited scientist among the 2.5 to 3 million authors in all disciplines (15). From 1996 to 2006, he was the tenth most cited HIV/AIDS researcher in the world. Currently Tony has over 1,100 publications.

In addition to all these scientific accomplishments, Tony is first and foremost an outstanding physician and teacher of clinical medicine. His clinical rounds are legendary. I say *are* because he still conducts them regularly. He is demanding of his staff but always gives back by sharing his wealth of clinical knowledge, constantly educating those around him. Every patient would love to have Dr. Fauci as their doctor. Every medical student and house officer would love to have Tony Fauci as their attending.

Over the years, 108 fellows joined Dr. Fauci's laboratory and have become members of his academic family. Many have become outstanding clinical investigators in their own right, and 7 have become members of the AAP.

Tony Fauci's accomplishments as a scientist and a clinician have brought him remarkable professional recognition. Since 1978 he has held 33 visiting professorships, given 490 major named lectureships, and received 31 honorary degrees and 124 awards and honors. He has served on 41 editorial boards, and for the past 25 years he has been on the editorial board of *Harrison's Principles of Internal Medicine*. He has been elected to the most prestigious societies in the United States and abroad. He has been a very active member of several societies, serving as President of the American Federation for Clinical Research and as a Council Member of the Institute of Medicine. In addition, for a 12-year period he held offices in this association, serving as Recorder, Councilor, Vice President, and President.

Administration

In 1984, NIH Director James B. Wyngaarden, MD, appointed Tony Fauci to be the fifth Director of NIAID. It was a perfect example of the right person being appointed to the right position at the right time. Under his direction, the funding for NIAID increased from about $320 million in 1984 to about $4.6 billion today. The size of NIAID relative to the other NIH institutes has grown from sixth to the second largest. But much more importantly, Tony has led the institute and the country through the incredible series of events his predecessor, NIAID Director Richard Krause, MD, described in his book, *The Restless Tide: The Persistent Challenge of the Microbial World* (16).

Politician

Tony's experiences as the streetwise kid growing up in Brooklyn undoubtedly helped him weather the storms of activist groups. He was the target of their criticism and even burned in effigy. Instead of being angry, Tony noted the pain of the people in these activist groups and approached them as a physician approaches a suffering patient. He began a dialogue that lasted for many years. Over time he won their trust and respect.

Tony is a great communicator. He has comforted the nation by appearing repeatedly on national television to explain one far-reaching crisis after another related to emerging and reemerging infectious diseases. On issues from AIDS, to anthrax, to SARS, to influenza, Tony provides confident, knowledgeable, realistic, and reassuring advice. He has earned the respect and trust of politicians on both sides of the aisle. He has advised every President from Ronald Reagan to the current George Bush. His knowledge, clarity, and frankness have made him so effective.

Personal traits

I had the privilege of working with Tony from 1985 to 1994 as his Scientific Director. Those were exciting years. Here is what I can tell you about Tony Fauci. Yes, he is very hard working. He is the best observer I've ever known. Nothing escapes him, nothing. He has a remarkable ability to contain his emotions.

Tony Fauci works hard and plays hard. He exercises about an hour every day. He enjoys fishing, occasional tennis, and cooking. To relieve stress in his office, he shoots hoops in a toy-sized net. One day as we were fishing on the Potomac River, he got so excited about a fish on the line that he flipped over our canoe. We survived, but I don't believe he caught that fish.

I would describe Tony Fauci as a realistic optimist. He demands perfection and that is good. He delegates authority and responsibility effectively. He is very

sensitive and loyal to his staff. He can keep his mouth shut. He never tells a secret, ever. He is a fabulous doctor and his patients adore him. When he talks he knows what he is talking about. He is wise. He cares about all people. He knows the names of the janitors, elevator operators, and animal caretakers. They all love and respect Tony Fauci because he talks with them, never at them. Tony Fauci is the kind of person you know you can call upon whenever you have a need, no matter what that need is.

And where do all these wonderful traits come from? I believe they come from his strong upbringing that instilled the importance of family. And that is reflected by his beautiful family. Tony met Christine Grady when she was a nurse at the NIH Clinical Center in 1983. They married two years later. Christine has gone on to build her own important career as one of the leading bioethicists in the world specializing on issues related to clinical research.

Christine and Tony have three fabulous children, Jennifer Ellen, a Harvard undergraduate, Megan Elizabeth, about to enter college, and Alison Christine, currently in high school (Figure (Figure7),7). Tony is phenomenally devoted and especially proud of his family, whom, in my opinion, gives him more satisfaction than anything else in life.

The AAP has made an incredible choice this year in selecting Anthony S. Fauci as their George M. Kober medalist. He is an exceptionally dedicated and talented physician, scientist, educator, administrator, spokesperson, politician, and advisor to our Congress and Presidents. His life's work will profoundly affect generations to come. He is, quite simply, an extraordinary man. It is for all these reasons that I am so honored that Tony Fauci asked me to introduce him as the 2007 Kober Medalist, the highest award of the Association. Please join me in saluting Anthony S. Fauci, MD, on the occasion of his receiving this very prestigious award.

Heinz (Heinrich) Ulrich Feldmann is a German-American virologist who currently serves as the chief of the laboratory of virology at Rocky Mountain Laboratories, NIAID and heads the Disease Modelling and Transmission section. His research focuses on highly pathogenic viruses that require strict biocontainment, including those that cause viral hemorrhagic fever such as Ebola and Lassa. He has been responsible for the development of timely viral countermeasures including the rVSV-ZEBOV vaccine (Ervebro), development of vaccines and drugs against SARS-CoV-2, and epidemiology of SARS-CoV.

Education

Heinz received his MD from the University of Marburg in 1987 and his PhD in 1988. His doctoral thesis focused on the structural relationship between alpha-influenzavirus serotype hemagglutinin 10 in mammals and avians.[1] He conducted joint postdoctoral research at the University of Marburg and the CDC special pathogens branch in Atlanta, Georgia.[2]

Career

From 1999-2008, he served as the chief of the special pathogens branch at the National Microbiology Laboratory at PHAC. In 2008, he began his tenure as the chief of the laboratory of virology at Rocky Mountain Laboratories at NIAID.[3]

Research focus Heinz Feldmann is a virologist. He researches highly infectious viruses such as the Lassa, Ebola and Marburg viruses. His research interests are vaccine development. He has developed a vaccine for Ebola and is considered a leading international Ebola expert. During outbreaks of Ebola, Lassa fever and SARS, he was often a consultant to the WHO on site. Viruses like Ebola reprogram the host cell's genetic makeup so that it produces more and more viruses. The treatment of such diseases is therefore very difficult. It is hardly possible to kill the virus yourself. **The doctors therefore hope for vaccinations. Heinz Feldmann developed the Ebola vaccine (rVSV-ZEBOV) back in 2003 and tested it on monkeys in 2005. The basis for the vector vaccine is the vesicular stomatitis virus (VSV). Animals get a kind of foot and mouth disease as a result, the virus is harmless to humans. Feldmann incorporated an Ebola protein into this virus through genetic engineering. The immune system of the vaccinated monkeys then produced antibodies that protected them 100 percent from infection. The vaccine has now been successfully tested in infected patients in studies.**

On behalf of the Canadian government, Feldmann has set up a high-security laboratory for highly infectious viruses. This includes research on filoviruses, bunyaviruses, arenaviruses and flaviviruses. He is a consultant on viral hemorrhagic fevers and related diseases for the World Health Organization (WHO). In this role, he was repeatedly responsible for on-site safety and health management in the event of disease outbreaks. The aim of his research is the development of diagnostics and vaccines.

"Dr. Heinz Feldman is an Associate Professor with the Department of Medical Microbiology at the University of Manitoba and the Chief of the Special Pathogens Program at the National Microbiology Laboratory, Public Health Agency of Canada. In addition, he holds an adjunct appointment with the Department of Pathology at the University of Texas Medical Branch. Dr. Feldman is a native of Germany. ***He received his B.Sc. in 1981 from the University of Giessen, Germany****, then graduated from Medical School at the University of Marburg in 1987, followed by his Ph.D. in 1988 also from this University. His postdoctoral research was in filoviruses and hantaviruses at the Institute of Virology, University of Marburg, Germany, and later at the Special Pathogens Branch, Centers for Disease Control and Prevention in Atlanta, U.S.A, where he held a fellowship from the 惟ational Research Council . Dr. Feldman is a laboratory expert on high containment viruses (BSL4) and serves as a consultant on viral hemorrhagic fevers for the World Health Organization. He is a member of national and international professional societies, an editor for Archives of Virology, and serves on the editorial board of several virology journals and as an invited reviewer for journals from related fields. He is an external scientific reviewer for national and international organizations and serves as a scientific consultant for high containment laboratories. His professional interest is in the pathogenesis of hemorrhagic fever viruses, such as Ebola virus, Lassa virus and hantaviruses, and other level 3 & 4 viral pathogens. Dr. Heinz Feldmann has published over 120 papers, book chapter and reviews and has presented at more conferences and seminars as an invited lecturer worldwide. He was awarded with several honors including the 慙ﾍfler-Frosch Award from the German Society for Virology and the 愴rnold Wedum Memorial Lecture Award from American Biological Safety Association."*

1988 (Aug) - "The structure of serotype H10 hemagglutinin of influenza A virus: comparison of an apathogenic avian and a mammalian strain pathogenic for mink"

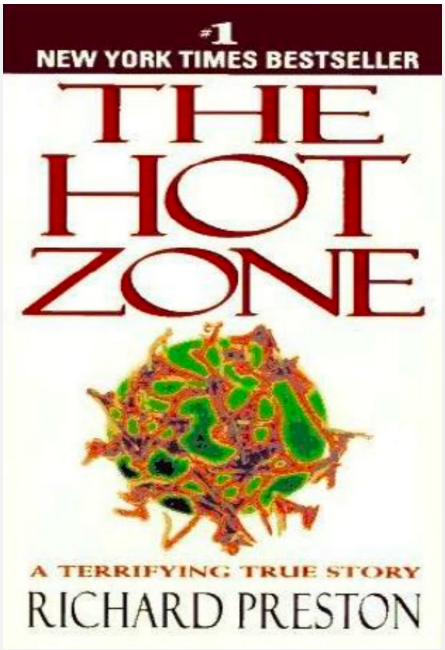
Abstract

The primary structure of the hemagglutinin of the apathogenic avian influenza virus A/chick/Germany/N/49 (H10N7) and of the serologically related strain A/mink/Sweden/84 (H10N4) pathogenic for mink has been elucidated by nucleotide sequence analysis, and the carbohydrates attached to the polypeptide have been determined. The H10 hemagglutinin has 65, 52, 46, 45, and 44% amino acid sequence homology with serotypes H7, H3, H1, H2, and H5, respectively. H10 and H7 hemagglutinins are also most closely related in their glycosylation patterns. There is a high sequence homology between both H10 strains supporting the concept that the mink virus has obtained its hemagglutinin from an avian strain. The sequence homology includes the cleavage site which consists of a single arginine as is the case with most other hemagglutinins exhibiting low susceptibility to proteolytic activation. The similarity in hemagglutinin structure between both H10 strains is discussed in light of the distinct differences in the pathogenicity of both viruses.

1990 (early) - At CDC (testing "Reston" ?) - In 1994 book "The Hot Zone: A Terrifying True Story "

From book - **"The Hot Zone" (book, 1994)** , written by **Richard McCann Preston (born 1954)** .

> *"The Hot Zone: A Terrifying True Story is a best-selling 1994 nonfiction thriller by Richard Preston about the origins and incidents involving viral hemorrhagic fevers, particularly ebolaviruses and marburgviruses.[1][2] The basis of the book was Preston's 1992 New Yorker article "Crisis in the Hot Zone".[3] ...*
>
> *The filoviruses—including Ebola virus, Sudan virus, Marburg virus, and Ravn virus—are Biosafety Level 4 agents, extremely dangerous to humans because they are very infectious, have a high fatality rate, and most have no known prophylactic measures, treatments, or cures. Along with describing the history of the devastation caused by two of these Central African diseases, Ebola virus disease and Marburg virus disease, Preston described a 1989 incident in which a relative of Ebola virus, Reston virus, was discovered at a primate quarantine facility in Reston, Virginia, less than 15 miles (24 km) away from Washington, D.C. "*



[HB0060][GDrive]

THE MOST DANGEROUS STRAIN : 1990 JANUARY

THE STRAIN OF Ebola virus that had erupted near Washington went into hiding somewhere in the rain forest. The cycling went on. The cycling must always go on if the virus is to maintain its existence. The Army, having certified that the monkey house had been nuked, returned to the possession of Hazleton Research Products. Hazleton began buying more monkeys from the Philippines, from the same monkey house near Manila, and restocked the building with crab-eating monkeys that had been trapped in the rain forests of Mindanao. Less than a month later, in the middle of January, some of the monkeys in Room C began dying with bloody noses. Dan Dalgard called **Peter Jahrling**. "Looks like we're affected again," he said.

The virus was Ebola. It had come from the Philippines. This time, since there had been no human casualties during the first outbreak, the Army, the C.D.C., and Hazleton jointly decided to isolate the monkeys – leave them alone and let the virus burn. Dan Dalgard hoped to save at least some of the monkeys, and his company did not want the Army to come back with space suits.

What happened in that building was a kind of experiment. Now they would see what Ebola could do naturally in a population of monkeys living in a confined air space, in a kind of city, as it were. The **Ebola Reston virus** jumped quickly from room to room, and as it blossomed in the monkeys, it seemed to mutate spontaneously into something that looked quite a lot like the common cold. **But it was an Ebola cold. The monkeys died with great quantities of clear mucus and green mucus running from their nose, mixed with blood that would not clot. Their lungs were destroyed, rotten and swimming with Ebola virus. They had pneumonia.**

When a single animal with a nosebleed showed up in a room, generally 80 percent of the animals died in that room shortly afterward. The virus was extraordinarily infective in monkeys. The Institute scientists suspected that they were seeing a mutant strain of Ebola, something new and a little different from what they had seen just a month before, in December, when the Army had nuked the monkey house. It was frightening – it was as if Ebola could change its character fast. As if a different strain could appear in a month's time. The clinical symptoms of the disease served as a reminder of the fact that Ebola is related to certain kind of colds seen in human children. It seemed that the virus could adapt quickly to new host, and that it could change its character rapidly as it entered a new population. Ebola apparently drifted through the building's air-handling ducts.

By January 24, it had entered Room B, and monkeys in that room started going into shock and dying with runny noses, red eyes, and masklike expressions on their faces. In the following weeks, the infection entered Room I,F,E, and D, and the animals in these rooms virtually all died.

Then, in mid-February, a Hazleton animal caretaker who will be called John Coleus was performing a necropsy on a dead monkey when he cut his thumb with a scalpel. He had been slicing apart the liver, one of the favorite nesting sites of Ebola. The scalpel blade, smeared with liver cells and blood, went deep into this thumb. He had had a major exposure to Ebola.

The liver that he had been cutting was rushed to USAMRIID for analysis. Tom Geisbert looked at a piece of it under his microscope and, to his dismay, found that it was "incredibly hot – I mean, wall to wall with virus." Everyone at the Institute thought John Coleus was going to die.

"Around her," Peter Jahrling told me, "we were frankly fearful that this guy had bought the farm." The C.D.C. decided not to put him into isolation. So Coleus visited bars and drank beer with his friends.

"Here at the Institute," Peter Jahrling said, "we were absolutely appalled when that guy went out to bars, drinking. Clearly the C.D.C. should not have let that happen. This was a serious virus and a serious situation. We don't know a whole lot about the virus. It could be like the common cold – it could have a latency period when you are shedding virus before you develop symptoms – and by the time you know you are sick, you might have infected sixteen people. There's an awful lot we don't know about this virus. We don't know where it came from, and we don't know what form it will take when it appears next time."

John Coleus had a minor medical condition that required surgery.

Doctors performed the operation while he was in the incubation period after his exposure to Ebola. There is no record indicating that he bled excessively during the surgery. He came through fine, and he is alive today, with no ill effects from his exposure.

AS FOR THE MONKEY HOUSE, the entire building died. The Army didn't have to nuke it. It was nuked by the Ebola Reston virus. Once again, there were no human casualties. However, something eerie and perhaps sinister occurred. A total of four men had worked as caretakers in the monkey house: Jarvis Purdy,

who had a heart attack; Milton Frantig, who had thrown up on the lawn; John Coleus, who had cut his thumb; and a fourth man. All four men eventually tested positive for Ebola Reston virus. They had all been infected with the agent. The virus had entered their bloodstreams and multiplied in their cells. Ebola proliferated in their bodies. It cycled in them. It carried on its life inside the monkey workers. But it did not make them sick, even while it multiplied inside them. If they had headaches or felt ill, none of them could recall it. Eventually the virus cleared from their systems naturally, disappeared from the blood, and as of this writing none of the men was affected by it. They are among the very, very few human survivors of Ebola virus. John Coleus certainly caught the virus when he cut himself with a bloody scalpel, no question about that. What is more worrisome is that the others had not cut themselves, yet the virus entered their bloodstreams. It got there somehow. Most likely it entered their blood thought contact with the lungs. It infected them through the air. When it became apparent to the Army researchers that three of the four men who became infected had not cut themselves, just about everyone at USAMRIID concluded that Ebola can spread through the air.

Dr. Philip Russell – the general who made the decision to send in the Army to stop the virus – recently said to me that although he had been "scared to death" about Ebola at the time, it wasn't until afterward, when he understood that the virus was spreading in the air among the monkeys, that the true potential for disaster sank in for him. "I was more frightened in retrospect," he said. "When I saw the respiratory evidence coming from those monkeys, I said to myself, My God, with certain kinds of small changes, this virus could become one that travels in rapid respiratory transmission through humans. I'm talking about the Black Death. Imagine a virus with the infectiousness of influenza and the mortality rate of black plague in the Middle Ages – that's what we're talking about."

The workers at Reston had symptomless Ebola virus. Why didn't it kill them? To this day, no one knows the answer to that question.

Symptomless Ebola – the men had been infected with something like an Ebola cold. A tiny difference in the virus's genetic code, probably resulting in a small structural change in the shape of one of the seven mysterious proteins in the virus particle, had apparently changed its effect tremendously in humans, rendering it mild or harmless even though it had destroyed the monkeys. This strain of Ebola knew the difference between a monkey and a person. And if it should mutate in some other direction...

ONE DAY IN spring, I went to visit Colonel Nancy Jaax, to interview her about her work during the Reston event. We talked in her office. She wore a black military sweater with silver eagles on the shoulder boards – she had recently made full colonel. A baby parrot slept in a box in the corner. The parrot woke up and squeaked.

"Are you hungry?" she asked it. "Yeah, yeah, I know." She pulled a turkey baster out of a bag and loaded it with parrot mush. She stuck the baster into the parrot's beak and squeezed the baster bulb, and the parrot closed it eyes with satisfaction.

She waved her hand at some filing cabinets. "Want to look at some Ebola? Take your pick."

"You show me."

She searched through a cabinet and removed a handful of glass slides, and carried them into another room, where a microscope sat on a table. It had two sets of eyepieces so that two people could look into it at the same time.

I sat down and stared in the microscope, into white nothingness.

"Okay, here's a good one," she said, and placed a slide under the lens.

I saw a field of cells. Here and there, pockets of cells had burst and liquefied.

"That's male reproductive tissue," she said. "It's heavily infected. This is Ebola Zaire in a monkey that we exposed through the lungs in 1986, in the study that Gene Johnson and I did."

Looking at the slice of monkey testicle, I got an unpleasant sensation. "You mean, it got into the monkey's lungs and moved to its – ?"

"Yeah. it's pretty yucky," she said. "Now I'm going to make you dizzy. I'm going to show you the lung."

The scene shifted, and we were looking at rotted pink Belgian lace.

"This is a slice of lung tissue. A monkey that was exposed through the lungs. See how the virus bubbles up in the lungs? It's Ebola Zaire."

I could see individual cells, and some of them were swollen with dark specks.

"We'll go to higher magnification."

The cells got bigger. The dark specks became angular, shadowy blobs. The blobs were bursting out of the cells, like something hatching.

"Those are big, fat bricks," she said.

They were Ebola crystalloids bursting out of the lungs. The lungs were popping Ebola directly into the air. My scalp crawled and I felt suddenly like a civilian who had seen something that maybe civilians should not see.

"These lungs are very hot," she said in a matter-of-face voice.

"You see those bricks budding directly into the air spaces of the lung?

When you cough, this stuff comes up your throat in your sputum. That's why you don't want someone who has Ebola coughing in your face."

"My God, it knows all about lungs, doesn't it?"

"Maybe not. It might live in an insect, and insects don't have lungs. But you see here how Ebola has adapted to this lung. It's budding out of the lung, right straight into the air."

"We're looking at a highly sophisticated organism, aren't we?"

"You're absolutely right. This hummer has an established life cycle. You get into what-if? game. What if it got into human lungs? If it mutates, it could be a problem. A big problem."

IN MARCH 1990, while the second outbreak at Reston was happening, the C.D.C. slapped a heavy set of restrictions on monkey importers, tightening the testing and quarantine procedures. The C.D.C. also temporarily revoked the license of three companies, Hazleton Research Products, the Charles River Primates Corporation, and Worldwide Primates, charging these companies with violations of quarantine rules. Their licenses were later reinstated. The

Primates Corporation, and Worldwide Primates, charging these companies with violations of quarantine rules. Their licenses were later reinstated. The C.D.C.'s action effectively stopped the importation of monkeys into the United States for several months. The total loss to Hazleton ran into the millions of dollars. Monkeys are worth money.

Despite the C.D.C.'s action against Hazleton, scientists at USAMRIID, and even some at the C.D.C., gave Dalgard and his company high praise for making the decision to hand over the monkey facility to the Army. "It was hard for Hazleton, but they did the right thing," Peter Jahrling said to me, summing up the general opinion of the experts.

Hazleton had been renting the monkey house from a commercial landlord. Not surprisingly, relations between the landlord and Hazleton did not flourish happily during the Army operation and the second Ebola outbreak. The company vacated the building afterward, and to this day it stands empty.

Peter Jahrling, a whiffer of Ebola who lived to tell about it, is now the principal scientist at USAMRIID. He and Tom Geisbert, following tradition in the naming of new viruses, named the strain they had discovered Reston, after the place where it was first noticed. In conversation, they sometimes refer to it casually as Ebola Reston. One day in his office, Jahrling showed me a photograph of some Ebola-virus particles. They resembled noodles that had been cooked al dente. "Look at this honker. Look at this long sucker here," Jahrling said, his finger tracing a loop. "It's Reston – oh, I was about to say it's Reston, but it isn't – it's Zaire. The point is, you can't easily tell the difference between the two strains by looking. It brings you back to a philosophical question: Why is the Zaire suffer hot for humans? Why isn't Reston hot for humans, when the strains are so close to each other? **The Ebola Reston virus is almost certainly transmitted by some airborne route.** Those Hazleton workers who had the virus – I'm pretty sure they got it through the air."

"Did we dodge a bullet?"

"I don't think we did," Jahrling said. "The bullet hit us. We were just lucky that the bullet we took was a rubber bullet from a twenty-two rather than a dumdum bullet from a forty-five. My concern is that people are saying, "Whew, we dodged a bullet.' And the next time they see Ebola in a microscope, they'll say, 'Aw, it's just Reston,' and they'll take it outside a containment facility. And we'll get whacked in the forehead when the stuff turns out not to be Reston but its big sister."

[Dr. Clarence James Peters (born 1940)] EVENTUALLY left the Army to become the chief of the Special Pathogen Branch at the Centers for Disease Control. Looking back on the Reston event, he said to me one day that was pretty sure Ebola had spread through the air, "I think the pattern of spread that we saw, and the fact that it spread to new rooms, suggest that Ebola aerosols were being generated and were present in the building," he said. "If you look at pictures of lungs from a monkey with Ebola Zaire, you see that the lungs are fogged with Ebola. Have you seen those pictures?"

"Yes, Nancy Jaax showed them to me."

"Then you know. You can see Ebola particles clearly in the air spaces of the lung."

"Did you ever try to see if you could put Ebola Reston into the air and spread it among monkeys that way?" I asked.

"No," he replied firmly. "I just didn't think that was a good idea. If anybody had found out that the Army was doing experiments to see if the Ebola virus had adapted to spreading in the respiratory tract, we would have been accused of doing offensive biological warfare – trying to create a doomsday germ. So we elected not to follow it up."

"That means you don't really know if Ebola spreads in the air."

"That's right. We don't know. You have to wonder if Ebola virus can do that or not. If it can, that's about the worst thing you can imagine."

SO THE THREE sisters – Marburg, Ebola Sudan, and Ebola Zaire – have been joined by a fourth sister, Reston. A group of researchers at the Special Pathogens Branch of the C.D.C. – principally Antony Sanchez and Heinz Feldmann – have picked apart the genes of all the filoviruses. They discovered that Zaire and Reston are so much alike that it's hard to say how they are different. When I met Anthony Sanchez and asked him about it, he said to me, "I call them kissing cousins. But I can't put my finger on why Reston apparently doesn't make us sick. Personally, I wouldn't feel comfortable handling it without a suit and maximum containment procedures." Each virus contains seven proteins, four of which are completely unknown. Something slightly different about one of the Reston proteins is a probably the reason the virus didn't go off in Washington like a bonfire. The Army and C.D.C have never downgraded the safety status of Reston virus. It seems classified as a Level 4 hot agent, and if you want to shake hands with it, you had better wearing a space suit. Safety experts feel that there is not enough evidence, yet, to show that the Reston strain is not an extremely dangerous virus. It may be, in fact, the most dangerous of all the filovirus sisters, because of its seeming ability to travel rather easily through the air, perhaps more easily than the others. A tiny change in its genetic code, and it might turn into a cough and take out the human race.

Why is the Reston virus so much like Ebola Zaire, when Reston supposedly comes from Asia? If the strains come from different continents, they should be quite different from each other. One possibility is that the Reston strain originated in Africa and flew to the Philippines on an airplane not long ago. In other words, Ebola has already entered the net and has been traveling lately. The experts do not doubt that a virus can hop around the world in a matters of days. Perhaps Ebola came out of Africa and landed in Asia a few years back.

Abstract

In a prospective randomized multicenter study Roxithromycin 150 mg or Doxycycline 100 mg was given b.i.d. p.o. for ten days to women with clinically diagnosed cervicitis. All women were seen as outpatients by one of eight licensed gynecologists in their private office in the Essen city area. With a cure and improvement rate of 100% in those women who completed therapy, Roxithromycin (n = 106) was as effective as Doxycycline (n = 104; 98%). At 90% Roxithromycin was as well tolerated as Doxycycline at 93%. Both drugs were clinically and microbiologically effective in eradicating Chlamydia trachomatis.

The oligosaccharide side chains of the glycoprotein of Marburg virus (MW 170,000) have been analyzed by determining their sensitivity to enzymatic degradation and their reactivity with lectins. It was found that they consist of *N*- and *O*-glycans. Studies employing chemical cross-linking showed that the glycoprotein is present as a homotrimer in the viral envelope. © 1991 Academic Press, Inc.

Marburg virus and the morphologically related Ebola virus are negative-stranded RNA viruses of the Filoviridae family (*1*). Both viruses cause a severe hemorrhagic fever with a mortality as high as 90% for Ebola virus (*2*) and about 35% for Marburg virus (*3*). Marburg virus was first isolated in 1967 from laboratory workers, when it caused three outbreaks in Europe at Marburg, Frankfurt, and Belgrade. The workers were infected after contact with tissues of monkeys imported from Uganda (*3*). Since that time, four more episodes of Marburg disease in Africa have been reported (*4*).

Marburg virus is an enveloped, filamentous virus containing a negative-stranded RNA genome with a molecular weight of approximately 4.2×10^6 (*5*). The virion RNA does not bind to oligo-dT–cellulose and is not infectious. SDS–PAGE profiles demonstrate the presence of seven virion proteins. These are the L protein (180K), the glycoprotein GP, the nucleoprotein NP (96K), and proteins VP40 (38K), VP 35 (32K), VP30 (28K), and VP24 (24K). In analogy to Ebola virus, VP35 may be a transcriptase component and VP30 a second nucleoprotein. The functions of VP40 and VP24 are still unknown (*4, 6*). The virion proteins are synthesized from monocistronic mRNA species analogous to those of Ebola virus (*7*). By *in vitro* translation, five different mRNA species could be assigned to proteins NP, VP40, VP35, VP30, and VP24. mRNAs coding for L and GP could not be detected yet (*4*).

GP is the only membrane glycoprotein of Marburg virus and forms the surface projections on the viral envelope. The molecular weight of GP has previously been estimated to be 140,000 but reevaluation with appropriate protein markers indicates that 170,000 may be more accurate (Fig. 1A). To examine the type of glycan–protein linkages, we treated virion proteins with different glycohydrolases. These treatments were performed overnight at 37° after denaturing of the proteins. As shown in Fig. 1B, the electrophoretic mobility of GP was slightly enhanced after incubation with endoglycosidase H (lane 4), and a distinct further increase was obtained by treatment with endoglycosidase F (lane 3), indicating that GP contains *N*-glycans of the oligomannosidic, but mainly of the complex type. However, carbohydrate not linked by *N*-glycosidic bonds was also present. Sensitivity of GP to endo-α-*N*-acetylgalactosaminidase (Fig. 1B, lane 2) indicated that *O*-glycans containing galactose-β(1–3)-*N*-acetylgalactosamine disaccharide units were present. The existence of *O*-glycans was also suggested by *N*-acetylgalactosamine which was detected, in addition to *N*-acetylglucosamine, when purified GP was subjected to amino acid analysis (data not shown).

To further assess the nature of the carbohydrate moiety, the affinity of various lectins to GP was analyzed. The lectins used were conjugated to the steroid hapten digoxigenin (Boehringer, Mannheim, Germany), and their binding was assayed by immunoblotting. The results obtained with peanut agglutinin (PNA) and *Datura stramonium* agglutinin (DSA) are shown in Fig. 2. As indicated by control experiments with fetuin that contains N- and O-linked oligosaccharides and with asialofetuin containing the same glycans devoid of sialic acid, PNA reacts specifically with the galactose-β(1–3)-*N*-acetylgalactosamine cores of *O*-glycans that must not be substituted with terminal *N*-acetylneuraminic acid. The observation that Marburg virus GP is recognized by PNA after incubation with endoglycosidase F or *N*-glycopeptidase F provides further support for the presence of *O*-glycans. It was unexpected, however, that PNA bound also to GP after incubation with endo-α-*N*-acetylgalactosaminidase. This suggests that galactose-β(1–3)-*N*-acetylgalactosamine cores substituted with nonsialic acid residues

(1) Purified Marburg virus proteins, (2) α_2-macroglobulin (170K), (3) *Escherichia coli* RNA polymerase subunits β and β′ (155K and 165K). 10% polyacrylamide gel. The proteins were stained with Coomassie brilliant blue. B. Effect of glycohydrolase treatment of GP labeled with [^{3}H]glucosamine. (1) Untreated virus, (2) treatment with endo-α-*N*-acetylgalactosaminidase (0.01 U/20 μl), (3) treatment with endoglycosidase F/*N*-glycosidase F (0.05 U/μl), (4) treatment with endoglycosidase H (0.05 U/μl). 6% polyacrylamide gel. E6 cells (ATCC Vero clone CRL 1586) (1.7) were infected with Marburg virus, strain Musoke, at a m.o.i. of 10^{-2} PFU/cell. Infected cells were incubated in Dulbecco's medium containing 2% fetal calf serum for 6 to 8 days (c.p.e. approximately 85%). When viral proteins were to be labeled, D[6– ^{3}H]glucosamine or [^{35}S]methionine was added 5 days p.i. at final concentrations of 20 μCi/ml, and labeled virus was harvested 24 hr thereafter. Culture fluid was clarified by centrifugation at 5,000 rpm for 15 min at 4°, and virus was pelleted at 25,000 rpm through a 20% sucrose cushion in TNE (0.01 *M* Tris–HCl, pH 7.4; 0.15 *M* NaCl; 2 m*M* EDTA) for 2 hr at 4°. The pellet was resuspended in TNE and further purified by gradient centrifugation in a SW28 rotor through 0 to 40% (w/v) potassium tartrate, 30 to 0% glycerol in TNE at 27,000 rpm for 16 hr, followed by 20 to 70% sucrose in TNE (containing 1 *M* NaCl) at 27,000 rpm for 4 hr at 4°. The virus band was isolated, diluted in TNE, and pelleted by centrifugation at 35,000 rpm for 30 min at 4°. Glycohydrolase treatments were performed at 37° overnight after denaturing of the proteins by boiling in buffer containing 0.1% SDS, 0.5% octylglucoside, 0.5% β-mercaptoethanol, 50 m*M* sodium acetate, pH 7.0, and 5 m*M* EDTA. The proteins were separated by electrophoresis on polyacrylamide slab gels and detected by fluorography.

FIG. 2. Reactivity of GP with lectins before and after glycohydrolase treatment. (–) Untreated sample, (F) treatment with endoglycosidase F/*N*-glycosidase F (0.05 U/20 μl), (NF) treatment with N-glycopeptidase F (0.1 U/20 μl), (O) treatment with endo-α-*N*-acetylgalactosaminidase (0.01 U/20μl). Growth and purification of virus and glycohydrolase treatment were carried out as described in the legend of Fig. 1. When two different glycohydrolases were used, the second one was added 3 hr after the first one. Proteins were analyzed on a 10% polyacrylamide slab gel, blotted onto nitrocellulose, and incubated with the lectins DSA and PNA. The digoxigenin conjugated lectins were detected using an anti-digoxigenin antibody (Boehringer Mannheim, Germany).

The first 3000 nucleotides from the 3′ end of the Marburg virus (MBG) genome were determined from cDNA clones produced from genomic RNA and mRNA. Identified in the sequence was a short putative leader sequence at the extreme 3′ end, followed by the complete nucleoprotein (NP) gene. The 5′ end of the NP mRNA was determined as was the polyadenylation site for the NP gene. The transcriptional start (3′ UUCUUCUUAUAAUU..) and termination (3′ ..UAAUUCUUUUU) signals of the MBG NP gene are very similar to those seen with Ebola virus (EBO). In comparison to other non-segmented negative-strand RNA viruses, filovirus transcriptional signals are most similar to members of the Paramyxovirus and Morbillivirus genera. In vitro translation of a run-off transcript containing the entire MBG NP coding region produced an authentic NP. Sequence comparisons of the 3′ end of the MBG and EBO genomes revealed weak nucleotide sequence similarity, but the predicted sequence of the first 400 amino acids of these viruses showed a high degree. This homology is encoded in divergent nucleotide sequences through different codon usages and substitutions of similar amino acids. A small region in the middle of the MBG and EBO NP sequences was found to contain a significant amino acid homology with NPs of paramyxoviruses and to a lesser extent with rhabdoviruses. Specific sites of conserved sequence are contained in hydrophobic domains and may have a common function. Alignments of the entire NP amino acid sequences of these viruses also suggest that filoviruses are more closely related to paramyxoviruses than to rhabdoviruses.

Sequence analysis of the Marburg virus nucleoprotein gene: comparison to Ebola virus and other non-segmented negative-strand RNA viruses

Anthony Sanchez,[1]*† Michael P. Kiley,[2] Hans-Dieter Klenk[3] and Heinz Feldmann[3]

[1] *Department of Biology and Laboratory for Microbial and Biochemical Sciences, Georgia State University, Atlanta, Georgia 30302-4010,* [2] *Research and Development Program, The Salk Institute, Government Services Division, Swiftwater, Pennsylvania 18370, U.S.A. and* [3] *Institut für Virologie, Philipps-Universität Marburg, 3550 Marburg, Germany*

The first 3000 nucleotides from the 3′ end of the Marburg virus (MBG) genome were determined from cDNA clones produced from genomic RNA and mRNA. Identified in the sequence was a short putative leader sequence at the extreme 3′ end, followed by the complete nucleoprotein (NP) gene. The 5′ end of the NP mRNA was determined as was the polyadenylation site for the NP gene. The transcriptional start (3′ UUCUUCUUAUAAUU..) and termination (3′ ..UAAUUCUUUUU) signals of the MBG NP gene are very similar to those seen with Ebola virus (EBO). In comparison to other non-segmented negative-strand RNA viruses, filovirus transcriptional signals are most similar to members of the Paramyxovirus and Morbillivirus genera. *In vitro* translation of a run-off transcript containing the entire MBG NP coding region produced an authentic NP. Sequence comparisons of the 3′ end of the MBG and EBO genomes revealed weak nucleotide sequence similarity, but the predicted sequence of the first 400 amino acids of these viruses showed a high degree. This homology is encoded in divergent nucleotide sequences through different codon usages and substitutions of similar amino acids. A small region in the middle of the MBG and EBO NP sequences was found to contain a significant amino acid homology with NPs of paramyxoviruses and to a lesser extent with rhabdoviruses. Specific sites of conserved sequence are contained in hydrophobic domains and may have a common function. Alignments of the entire NP amino acid sequences of these viruses also suggest that filoviruses are more closely related to paramyxoviruses than to rhabdoviruses.

Introduction

Marburg virus (MBG) is a 'Biosafety Level 4' agent (Richardson & Barkley, 1988) that was first identified in 1967 following human outbreaks of acute haemorrhagic fever in the cities of Marburg and Frankfurt, Germany, and Belgrade, Yugoslavia (Martini & Siegert, 1971). Initial infections occurred in persons working with blood, organs or cell culturing of tissues from infected African green monkeys (*Cercopithecus aethiops*) imported from Uganda. This pathogen received its name from the city of Marburg, where most of the cases occurred and where much of the initial work on the virus was performed. Three subsequent human outbreaks have been attributed to MBG (Gear *et al.*, 1975; Smith *et al.*, 1982; Kiley *et al.*, 1988).

MBG, Ebola virus (EBO) and Reston virus (RES) (Ebola-like monkey filovirus; Centers for Disease Control, 1989; Jahrling *et al.*, 1990) are non-segmented negative-strand (NNS) RNA viruses and are members of the family Filoviridae. Together with the Paramyxoviridae and Rhabdoviridae, these families make up the order *Mononegavirales*, a status accorded to them in 1990 by the International Committee on Taxonomy of Viruses (Pringle, 1991). The filovirus virion is bacilliform in morphology and is composed of a helical nucleocapsid surrounded by a lipid envelope. Virions contain at least seven structural proteins and for MBG these proteins are an RNA-dependent RNA polymerase (L protein; M_r 267K; unpublished data), a single surface glycoprotein (GP; M_r 170K; Feldmann *et al.*, 1991), a nucleoprotein (NP; M_r 94K) and four proteins ranging in M_r from 24K to 38K (Kiley *et al.*, 1988).

The genetic features of filoviruses are similar to other NNS viruses in that (i) transcription of the infecting ribonucleoprotein complex, which contains a single negative-sense genomic RNA template, yields monocistronic polyadenylated mRNA species and (ii) for EBO

† Present address: Special Pathogens Branch, Division of Viral and Rickettsial Diseases, National Center for Infectious Diseases, Centers for Disease Control, 1600 Clifton Road, Mail Stop G14, Atlanta, Georgia 30333, U.S.A.

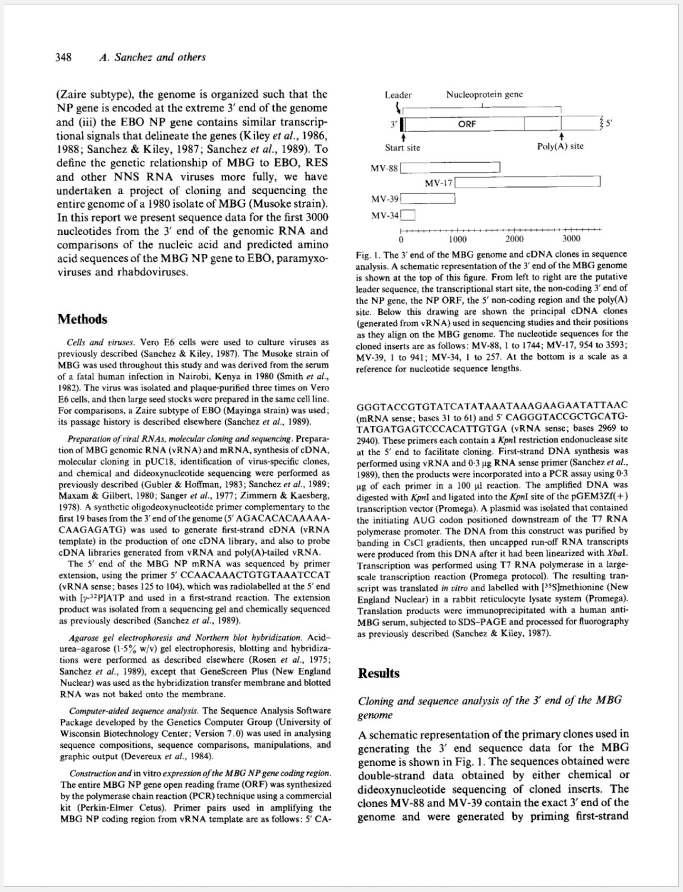
0001-0487 © 1992 SGM



(Zaire subtype), the genome is organized such that the NP gene is encoded at the extreme 3′ end of the genome and (iii) the EBO NP gene contains similar transcriptional signals that delineate the genes (Kiley *et al.*, 1986, 1988; Sanchez & Kiley, 1987; Sanchez *et al.*, 1989). To define the genetic relationship of MBG to EBO, RES and other NNS RNA viruses more fully, we have undertaken a project of cloning and sequencing the entire genome of a 1980 isolate of MBG (Musoke strain). In this report we present sequence data for the first 3000 nucleotides from the 3′ end of the genomic RNA and comparisons of the nucleic acid and predicted amino acid sequences of the MBG NP gene to EBO, paramyxoviruses and rhabdoviruses.

Methods

Cells and viruses. Vero E6 cells were used to culture viruses as previously described (Sanchez & Kiley, 1987). The Musoke strain of MBG was used throughout this study and was derived from the serum of a fatal human infection in Nairobi, Kenya in 1980 (Smith *et al.*, 1982). The virus was isolated and plaque-purified three times on Vero E6 cells, and then large seed stocks were prepared in the same cell line. For comparisons, a Zaire subtype of EBO (Mayinga strain) was used; its passage history is described elsewhere (Sanchez *et al.*, 1989).

Preparation of viral RNAs, molecular cloning and sequencing. Preparation of MBG genomic RNA (vRNA) and mRNA, synthesis of cDNA, molecular cloning in pUC18, identification of virus-specific clones, and chemical and dideoxynucleotide sequencing were performed as previously described (Gubler & Hoffman, 1983; Sanchez *et al.*, 1989; Maxam & Gilbert, 1980; Sanger *et al.*, 1977; Zimmern & Kaesberg, 1978). A synthetic oligodeoxynucleotide primer complementary to the first 19 bases from the 3′ end of the genome (5′ AGACACACAAAAA-CAAGAGATG) was used to generate first-strand cDNA (vRNA template) in the production of one cDNA library, and also to probe cDNA libraries generated from vRNA and poly(A)-tailed vRNA.

The 5′ end of the MBG NP mRNA was sequenced by primer extension, using the primer 5′ CCAACAAACTGTGTAAATCCAT (vRNA sense; bases 125 to 104), which was radiolabelled at the 5′ end with [γ-^{32}P]ATP and used in a first-strand reaction. The extension product was isolated from a sequencing gel and chemically sequenced as previously described (Sanchez *et al.*, 1989).

Agarose gel electrophoresis and Northern blot hybridization. Acid–urea–agarose (1·5% w/v) gel electrophoresis, blotting and hybridizations were performed as described elsewhere (Rosen *et al.*, 1975; Sanchez *et al.*, 1989), except that GeneScreen Plus (New England Nuclear) was used as the hybridization transfer membrane and blotted RNA was not baked onto the membrane.

Computer-aided sequence analysis. The Sequence Analysis Software Package developed by the Genetics Computer Group (University of Wisconsin Biotechnology Center; Version 7.0) was used in analysing sequence compositions, sequence comparisons, manipulations, and graphic output (Devereux *et al.*, 1984).

Construction and in vitro *expression of the MBG NP gene coding region.* The entire MBG NP gene open reading frame (ORF) was synthesized by the polymerase chain reaction (PCR) technique using a commercial kit (Perkin-Elmer Cetus). Primer pairs used in amplifying the MBG NP coding region from vRNA template are as follows: 5′ CA-

Fig. 1. The 3′ end of the MBG genome and cDNA clones in sequence analysis. A schematic representation of the 3′ end of the MBG genome is shown at the top of this figure. From left to right are the putative leader sequence, the transcriptional start site, the non-coding 3′ end of the NP gene, the NP ORF, the 5′ non-coding region and the poly(A) site. Below this drawing are shown the principal cDNA clones (generated from vRNA) used in sequencing studies and their positions as they align on the MBG genome. The nucleotide sequences for the cloned inserts are as follows: MV-88, 1 to 1744; MV-17, 954 to 3593; MV-39, 1 to 941; MV-34, 1 to 257. At the bottom is a scale as a reference for nucleotide sequence lengths.

GGGTACCGTGTATCATATAAATAAAGAAGAATATTAAC (mRNA sense; bases 31 to 61) and 5′ CAGGGTACCGCTGCATG-TATGATGAGTCCCACATTGTGA (vRNA sense; bases 2969 to 2940). These primers each contain a *Kpn*I restriction endonuclease site at the 5′ end to facilitate cloning. First-strand DNA synthesis was performed using vRNA and 0·3 μg RNA sense primer (Sanchez *et al.*, 1989), then the products were incorporated into a PCR assay using 0·3 μg of each primer in a 100 μl reaction. The amplified DNA was digested with *Kpn*I and ligated into the *Kpn*I site of the pGEM3Zf(+) transcription vector (Promega). A plasmid was isolated that contained the initiating AUG codon positioned downstream of the T7 RNA polymerase promoter. The DNA from this construct was purified by banding in CsCl gradients, then uncapped run-off RNA transcripts were produced from this DNA after it had been linearized with *Xba*I. Transcription was performed using T7 RNA polymerase in a large-scale transcription reaction (Promega protocol). The resulting transcript was translated *in vitro* and labelled with [^{35}S]methionine (New England Nuclear) in a rabbit reticulocyte lysate system (Promega). Translation products were immunoprecipitated with a human anti-MBG serum, subjected to SDS–PAGE and processed for fluorography as previously described (Sanchez & Kiley, 1987).

Results

Cloning and sequence analysis of the 3′ end of the MBG genome

A schematic representation of the primary clones used in generating the 3′ end sequence data for the MBG genome is shown in Fig. 1. The sequences obtained were double-strand data obtained by either chemical or dideoxynucleotide sequencing of cloned inserts. The clones MV-88 and MV-39 contain the exact 3′ end of the genome and were generated by priming first-strand

Abstract

In the present serological study 120 monkey sera from different species originating from the Philippines, China, Uganda and undetermined sources and several groups of human sera comprising a total of 1288 specimens from people living in Germany were examined for the presence of antibodies directed against filoviruses (Marburg virus, strain Musoke/Ebola virus, subtype Zaire, strain Mayinga/Reston virus). Sera were screened using a filovirus-specific enzyme-linked immunosorbent assay (ELISA). ELISA-positive sera were then confirmed by the indirect immunofluorescence technique, Western blot technique, and a blocking assay, and declared positive when at least one confirmation test was reactive. Altogether 43.3% of the monkey sera and 6.9% of the human sera reacted positively with at least one of the three different filovirus antigens. The blocking assays show that antibodies, detected in the sera, are directed to specific filovirus antigens and not caused by antigenic cross-reactivity with hitherto unknown agents. Data presented in this report suggest that subclinical filovirus infections may also occur in humans and in subhuman primates. They further suggest that filoviruses are not restricted to the African continent.

Abstract

The nucleotide sequence of the L gene of Marburg virus, strain Musoke, has been determined. The L gene has a single long open reading frame encoding a polypeptide of 2330 amino acids (MW 267,175) that represents the viral RNA-dependent RNA polymerase. The putative transcription start signal (3'CUACCUAUAAUU 5') and the termination signal (3' UAAUUCUUUUU 5') of the gene could be identified. Computer-assisted comparison of the L protein with L proteins of other nonsegmented negative-stranded RNA viruses (Paramyxoviridae: Sendai virus, Newcastle disease virus, human parainfluenza 3 virus, measles virus, human respiratory syncytial virus; Rhabdoviridae: vesicular stomatitis virus, rabies virus) revealed significant homologies primarily in the N-terminal half of the proteins. We have identified three common conserved boxes (A, B, and C) among filo-, paramyxo-, and rhabdovirus L proteins, which are probably involved in the polymerase function. The L proteins can be divided into an N-terminal half, which seems to accommodate the common enzymatic sites, and a C-terminal half carrying virus specific peculiarities. The data presented here suggest a common evolutionary history for all nonsegmented negative-stranded RNA viruses and show that filoviruses are more closely related to paramyxo- than to rhabdoviruses.

Abstract

The genome of Marburg virus (MBG), a filovirus, is 19.1 kb in length and thus the largest one found with negative-strand RNA viruses. The gene order - 3' untranslated region-NP-VP35-VP40-GP-VP30-VP24-L-5' untranslated region-resembles that of other non-segmented negative-strand (NNS) RNA viruses. Six species of polyadenylated subgenomic RNAs, isolated from MBG-infected cells, are complementary to the negative-strand RNA genome. They can be translated in vitro into the known structural proteins NP, GP (non-glycosylated form), VP40, VP35, VP30 and VP24. At the gene boundaries conserved transcriptional start (3'-NNCUNCNUNUAAUU-5') and stop signals (3'-UAAUUCUUUUU-5') are located containing the highly conserved pentamer 3'-UAAUU-5'. Comparison with other NNS RNA viruses shows conservation primarily in the termination signals, whereas the start signals are more variable. The intergenic regions vary in length and nucleotide composition. All genes have relatively long 3' and 5' end non-coding regions. The putative 3' and 5' leader RNA sequences of the MBG genome resemble those of other NNS RNA viruses in length, conservation at the 3' and 5' ends, and in being complementary at their extremities. The data support the concept of a common taxonomic order Mononegavirales comprising the Filoviridae, Paramyxoviridae, and Rhabdoviridae families.

Marburg virus was propagated in E6 cells, a cloned cell line of Vero cells, in the presence of [6-^{3}H]glucosamine. Radiolabelled viral glycoprotein was digested with trypsin, and oligosaccharides were liberated by sequential treatment with endo-β-*N*-acetylglucosaminidase H, peptide-*N*^{4}-(*N*-acetyl-β-glucosaminyl)asparagine amidase F and *O*-glycosidase, by β-elimination, and by alkaline hydrolysis. After fractionation by HPLC and gel filtration, glycans were characterized chromatographically, by digestion with exoglycosidases and, in part, by methylation analysis and liquid secondary ion mass spectrometry. The oligosaccharide structures thus established include oligomannosidic and hybrid-type *N*-glycans, as well as neutral fucosylated bi-, tri- and tetraantennary species, most of which carry an additional bisecting *N*-acetylglucosamine. In addition, high amounts of neutral mucin-type *O*-glycans with type-1 and type-2 core structures were detected. None of the glycans present in this viral glycoprotein carried sialic acid residues.

Key words: Filoviridae/glycoprotein/Marburg virus/oligosaccharides/structure analysis

Introduction

Marburg virus, as well as the morphologically related Ebola virus, are the prototype members of a new virus family, called Filoviridae (Kiley *et al.*, 1982), which constitutes the third family of non-segmented negative-strand RNA viruses within the newly proposed order Mononegavirales besides the Paramyxoviridae and the Rhabdoviridae (ICTV, 1990). Recently, a third member of this virus family, which is antigenically closely related to Ebola virus, was isolated from cynomolgus monkeys (*Macaca fascicularis*) imported to the USA from the Philippines (Centres for Disease Control, 1989; Jahrling *et al.*, 1990). This agent is called Reston virus.

Marburg virus and Ebola virus are extremely pathogenic for humans, causing a severe haemorrhagic disease with mortality rates of 35% for Marburg virus (Martini and Siegert, 1971) and up to 88% for Ebola virus (subtype Zaire) (Johnson *et al.*, 1977). Filovirus infections were unknown until 1967, when Marburg virus was first isolated in outbreaks among laboratory workers in Germany and Yugoslavia. The source of these simultaneous outbreaks of viral haemorrhagic disease has been attributed to virus-infected African green monkeys (*Cercopithecus aethiops*) imported from Uganda (Martini and Siegert, 1971).

Filoviruses are composed of a helical nucleocapsid surrounded by a lipid envelope. Virions contain at least seven structural proteins. For Marburg virus, these proteins are an RNA-dependent RNA polymerase (L protein; 267 kDa), a glycoprotein (GP; 170 kDa), a nucleoprotein (NP; 96 kDa), and the viral proteins VP40 (38 kDa), VP35 (32 kDa), VP30 (28 kDa) and VP24 (24 kDa) (Kiley *et al.*, 1988; Feldmann *et al.*, 1991; Mühlberger *et al.*, 1992; Sanchez *et al.*, 1992).

The glycoprotein of Marburg virus is highly glycosylated and inserted in the viral membrane as a homotrimer (Feldmann *et al.*, 1991). Lectin binding and endoglycosidase studies demonstrated the presence of two types of carbohydrate side-chains: *N*-glycosidically linked complex and high-mannose type glycans as well as the *O*-linked disaccharide Galβ3GalNAc (Feldmann *et al.*, 1991).

Membrane glycoproteins of enveloped viruses play a key role in infection by mediating receptor recognition, binding of the virion, and subsequent fusion of viral and cellular membranes. Possibly, the glycoprotein of Marburg virus has similar functions. Since it is the only integral membrane protein of the virus, the glycoprotein is probably also the major target for the immune response of the infected host. As a prerequisite for studies on the role of this molecule in Marburg virus infection, as well as its antigenicity, we are analysing the primary structure of this viral glycoprotein. In this report, a detailed structural analysis of its carbohydrate substituents is presented.

Results

Isolation and characterization of radiolabelled viral glycoprotein

For metabolic labelling, Marburg virus was propagated in E6 cells, a cloned line of Vero cells. The radioactive nutrients were added 5 days post-infection for 24 h. Virus particles were isolated from the supernatant, purified by gradient centrifugation and sedimentation steps, and the radiolabelled viral proteins were analysed by SDS gel electrophoresis followed by fluorography (Figure 1A). *In vivo* labelling with [^{35}S]methionine marked all viral structural proteins (Figure 1A, lane 1), whereas only the glycoprotein was radiolabelled when D-[6-^{3}H]glucosamine was used (Figure 1, lane 2). Starting from tissue culture supernatant of ~2.5 × 10^8 infected cells, metabolically labelled with 2 mCi D-[6-^{3}H]glucosamine, viral glycoprotein comprising 2 × 10^6 c.p.m. was obtained. For determination of the radioactive sugar constituents, aliquots were hydrolysed and the monosaccharides released were identified by co-chromatography with monosaccharide standards in high-pH anion-exchange (HPAE)-HPLC. The results demonstrated that the [^{3}H]glucosamine-labelled viral glycoprotein contained radiolabelled *N*-acetylglucosamine, *N*-acetylgalactosamine and galactose in a ratio of ~9.8:1.35:1, indicating that small amounts of [6-^{3}H]glucosamine have been metabolized

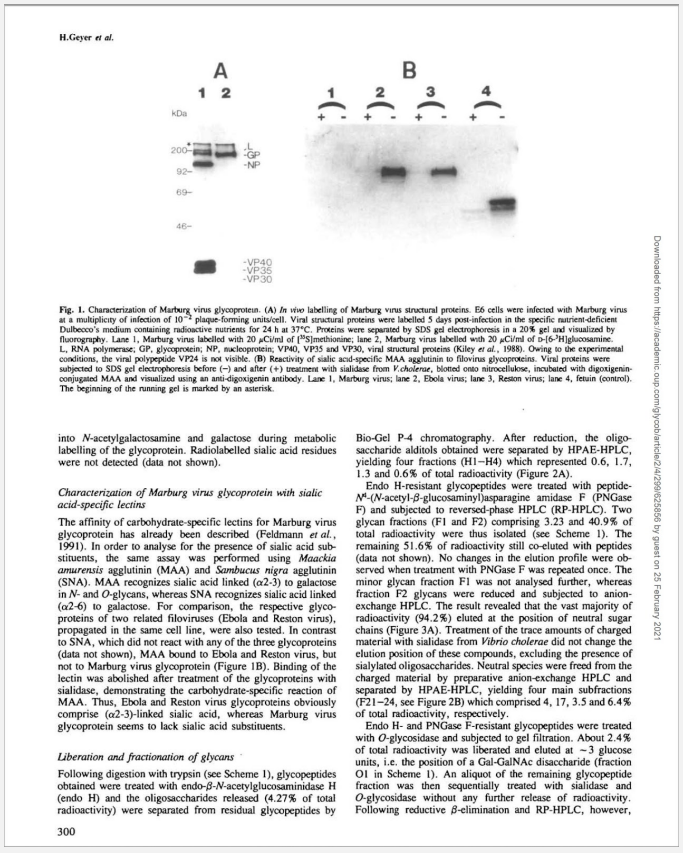

Fig. 1. Characterization of Marburg virus glycoprotein. (**A**) *In vivo* labelling of Marburg virus structural proteins. E6 cells were infected with Marburg virus at a multiplicity of infection of 10^{-2} plaque-forming units/cell. Viral structural proteins were labelled 5 days post-infection in the specific nutrient-deficient Dulbecco's medium containing radioactive nutrients for 24 h at 37°C. Proteins were separated by SDS gel electrophoresis in a 20% gel and visualized by fluorography. Lane 1, Marburg virus labelled with 20 μCi/ml of [^{35}S]methionine; lane 2, Marburg virus labelled with 20 μCi/ml of D-[6-^{3}H]glucosamine. L, RNA polymerase; GP, glycoprotein; NP, nucleoprotein; VP40, VP35 and VP30, viral structural proteins (Kiley *et al.*, 1988). Owing to the experimental conditions, the viral polypeptide VP24 is not visible. (**B**) Reactivity of sialic acid-specific MAA agglutinin to filovirus glycoproteins. Viral proteins were subjected to SDS gel electrophoresis before (−) and after (+) treatment with sialidase from *V.cholerae*, blotted onto nitrocellulose, incubated with digoxigenin-conjugated MAA and visualized using an anti-digoxigenin antibody. Lane 1, Marburg virus; lane 2, Ebola virus; lane 3, Reston virus; lane 4, fetuin (control). The beginning of the running gel is marked by an asterisk.

into *N*-acetylgalactosamine and galactose during metabolic labelling of the glycoprotein. Radiolabelled sialic acid residues were not detected (data not shown).

Characterization of Marburg virus glycoprotein with sialic acid-specific lectins

The affinity of carbohydrate-specific lectins for Marburg virus glycoprotein has already been described (Feldmann *et al.*, 1991). In order to analyse for the presence of sialic acid substituents, the same assay was performed using *Maackia amurensis* agglutinin (MAA) and *Sambucus nigra* agglutinin (SNA). MAA recognizes sialic acid linked (α2-3) to galactose in *N*- and *O*-glycans, whereas SNA recognizes sialic acid linked (α2-6) to galactose. For comparison, the respective glycoproteins of two related filoviruses (Ebola and Reston virus), propagated in the same cell line, were also tested. In contrast to SNA, which did not react with any of the three glycoproteins (data not shown), MAA bound to Ebola and Reston virus, but not to Marburg virus glycoprotein (Figure 1B). Binding of the lectin was abolished after treatment of the glycoproteins with sialidase, demonstrating the carbohydrate-specific reaction of MAA. Thus, Ebola and Reston virus glycoproteins obviously comprise (α2-3)-linked sialic acid, whereas Marburg virus glycoprotein seems to lack sialic acid substituents.

Liberation and fractionation of glycans

Following digestion with trypsin (see Scheme 1), glycopeptides obtained were treated with endo-β-*N*-acetylglucosaminidase H (endo H) and the oligosaccharides released (4.27% of total radioactivity) were separated from residual glycopeptides by Bio-Gel P-4 chromatography. After reduction, the oligosaccharide alditols obtained were separated by HPAE-HPLC, yielding four fractions (H1–H4) which represented 0.6, 1.7, 1.3 and 0.6% of total radioactivity (Figure 2A).

Endo H-resistant glycopeptides were treated with peptide-*N*^{4}-(*N*-acetyl-β-glucosaminyl)asparagine amidase F (PNGase F) and subjected to reversed-phase HPLC (RP-HPLC). Two glycan fractions (F1 and F2) comprising 3.23 and 40.9% of total radioactivity were thus isolated (see Scheme 1). The remaining 51.6% of radioactivity still co-eluted with peptides (data not shown). No changes in the elution profile were observed when treatment with PNGase F was repeated once. The minor glycan fraction F1 was not analysed further, whereas fraction F2 glycans were reduced and subjected to anion-exchange HPLC. The result revealed that the vast majority of radioactivity (94.2%) eluted at the position of neutral sugar chains (Figure 3A). Treatment of the trace amounts of charged material with sialidase from *Vibrio cholerae* did not change the elution position of these compounds, excluding the presence of sialylated oligosaccharides. Neutral species were freed from the charged material by preparative anion-exchange HPLC and separated by HPAE-HPLC, yielding four main subfractions (F21–24, see Figure 2B) which comprised 4, 17, 3.5 and 6.4% of total radioactivity, respectively.

Endo H- and PNGase F-resistant glycopeptides were treated with *O*-glycosidase and subjected to gel filtration. About 2.4% of total radioactivity was liberated and eluted at ~3 glucose units, i.e. the position of a Gal-GalNAc disaccharide (fraction O1 in Scheme 1). An aliquot of the remaining glycopeptide fraction was then sequentially treated with sialidase and *O*-glycosidase without any further release of radioactivity. Following reductive β-elimination and RP-HPLC, however,

JOURNAL OF GENERAL VIROLOGY Volume 75, Issue 4

The nucleoprotein (NP) of Marburg virus (MBG), a filovirus, is encoded by the gene closest to the 3′ end of the non-segmented negative-strand RNA genome. Sequence comparison has indicated that NP is the functional equivalent to the nucleoproteins of paramyxoviruses and rhabdoviruses. Expression of recombinant NP in two eukaryotic systems using vaccinia virus and baculovirus (vectors pSC11 and pAcYMB1, respectively) and analysis of MBG-specific proteins have demonstrated that the NP of MBG is phosphorylated. The NP appeared in two forms differing in M r by about 2K (94K and 92K respectively). Dephosphorylation clearly demonstrated that the 94K form is phosphorylated whereas the 92K form is unphosphorylated. In virion particles NP was exclusively present in the phosphorylated form. These findings suggest that only the phosphorylated NP can form nucleocapsid complexes and interact with the genomic RNA.

The nucleoprotein (NP) of Marburg virus (MBG), a filovirus, is encoded by the gene closest to the 3′ end of the non-segmented negative-strand RNA genome. Sequence comparison has indicated that NP is the functional equivalent to the nucleoproteins of paramyxoviruses and rhabdoviruses. Expression of recombinant NP in two eukaryotic systems using vaccinia virus and baculovirus (vectors pSC11 and pAcYMB1, respectively) and analysis of MBG-specific proteins have demonstrated that the NP of MBG is phosphorylated. The NP appeared in two forms differing in M_r by about 2K (94K and 92K respectively). Dephosphorylation clearly demonstrated that the 94K form is phosphorylated whereas the 92K form is unphosphorylated. In virion particles NP was exclusively present in the phosphorylated form. These findings suggest that only the phosphorylated NP can form nucleocapsid complexes and interact with the genomic RNA.

Introduction

The family *Filoviridae* accommodates Marburg virus (MBG), the prototype of the family, Ebola virus (EBO) and Reston virus (RES) (Kiley *et al.*, 1982; Murphy *et al.*, 1990). Filoviruses are classified in the order *Mononegavirales* (Pringle, 1991) which also contains the non-segmented negative-strand (NNS) RNA virus families *Paramyxoviridae* and *Rhabdoviridae*. MBG and EBO are extremely pathogenic for humans and non-human primates, causing a severe haemorrhagic disease with high mortality rates.

MBG particles consist of at least seven structural proteins: the L protein (Mühlberger *et al.*, 1992), the glycoprotein (GP) (Will *et al.*, 1993), the nucleoprotein (NP) (94K) (Sanchez *et al.*, 1992), and four viral structural proteins (VP) with M_rs of 38K (VP40), 32K (VP35), 28K (VP30) and 24K (VP24) (Kiley *et al.*, 1988). The corresponding genes are located on the NNS RNA genome in the following linear order: 3′ untranslated region–NP–VP35–VP40–GP–VP30–VP24–L–5′ untranslated region (Feldmann *et al.*, 1992).

The mature NP in MBG particles has an M_r of 94K and is the major component of the viral nucleocapsid. It represents approximately 27% of the virion protein mass (Kiley *et al.*, 1988). The nucleic acid sequence of the NP gene has been recently elucidated (Sanchez *et al.*, 1992). Comparison of the deduced amino acid sequence showed a high degree of homology to the N-terminal 400 amino acids of the EBO NP. A small region in the middle of the NP sequence was found to contain a significant homology with the nucleoproteins of paramyxoviruses and to a lesser extent with those of rhabdoviruses (Barr *et al.*, 1991; Sanchez *et al.*, 1992).

Little is known about the mode of transcription and replication of filoviruses and their unusually high pathogenicity. Detailed knowledge of the functions of the various MBG proteins, their co- and post-translational modifications, and their interactions with virion or cellular proteins or nucleic acids would create a foundation for further investigations. Studies on paramyxoviruses and rhabdoviruses have shown that the nucleoprotein plays an important role in the transcription and replication of these viruses. The nucleoprotein encapsidates the template RNA which is the only form that is transcribed. Newly synthesized nucleoprotein seems to mediate the formation of plus-sense ribonucleoprotein complexes which are the template for synthesis of progeny minus-sense RNA (for reviews see Wagner, 1987; Kingsbury, 1991; Banerjee & Barik, 1992). In this report we present data on the expression of MBG NP in eukaryotic and prokaryotic systems and show that the mature NP is phosphorylated.

Methods

Viruses and cell lines. The Musoke strain of MBG isolated in 1980 in Kenya (Smith *et al.*, 1982) and the strain WR of vaccinia virus were propagated in E6 cells, a cloned cell line of Vero cells (ATCC CRL

† Present address: Special Pathogens Branch, Centers for Disease Control, 1600 Clifton Road, Mail Stop G14, Atlanta, Georgia 30333, U.S.A.

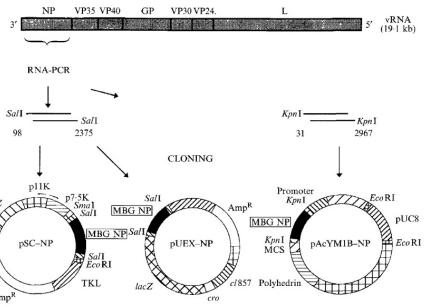

Fig. 1. Cloning strategy for the transfer plasmid vectors. The NP ORF was synthesized from genomic RNA (vRNA) using two sets of primers supplemented at their 5′ ends with either *Kpn*I or *Sal*I sites. Primer set I (*Sal*I sites) extends nucleotides 98 to 2375 and primer set II (*Kpn*I sites) nucleotides 31 to 2967. DNA fragments were cloned into the illustrated plasmid vectors: pAcYM1B for construction of recombinant baculovirus, pSC11 for construction of recombinant vaccinia virus, and pUEX for expression in *E. coli*.

1586). *Autographa californica* nuclear polyhedrosis virus (AcMNPV) was grown in a *Spodoptera frugiperda* cell line (SFVL; Kuroda *et al.*, 1986).

Propagation and labelling of virus. E6 cells were infected with MBG at an m.o.i. of 0·01. Purification of viral particles and preparation of viral antigen were performed as described previously (Mühlberger *et al.*, 1992), and the final pellet of purified virus particles was resuspended in TNE (0·01 M-Tris–HCl pH 7·4, 0·15 M-NaCl, 2 mM-EDTA) containing 1% SDS. When viral proteins were to be labelled, 20 μCi/ml [^{35}S]methionine or [^{32}P]orthophosphate (Amersham) was added 5 days post-infection (p.i.), and labelled virus was harvested 24 h thereafter. For viral genomic RNA isolation, a protocol described in detail by Mühlberger *et al.* (1992) was used.

SFVL cells were infected with AcMNPV or recombinant AcMNPV (BVNP) at an m.o.i. of 1. Virus growth (27 °C) and purification were carried out as described elsewhere (Kuroda *et al.*, 1986). For *in vivo* labelling experiments, SFVL cells were infected at an m.o.i. of 10. Forty-eight hours p.i., infected cells were starved with the appropriate nutrient-deficient medium for 2 h, labelled for 2 h by adding 100 μCi/ml [^{35}S]methionine or [^{32}P]orthophosphate, and then lysed in RIPA buffer (20 mM-MES, 55 mM-Tris–HCl, 200 mM-NaCl, 10 mM-EDTA, 1% w/v SDS pH 7·8, 1% v/v Triton X-100, 5% v/v Trasylol, 1 mM-PMSF, 10 mM-iodoacetamide). Insoluble components were pelleted at 14000 r.p.m. for 10 min in an Eppendorf centrifuge and the supernatant was stored at 4 °C.

E6 cells were infected with vaccinia virus (strain WR) or recombinant vaccinia virus (vSCNP) at an m.o.i. of 0·01. Preparation of virus stocks was performed as described by Mackett *et al.* (1986). For *in vivo* labelling experiments E6 cells were infected at an m.o.i. of 10. Twenty-four hours p.i., cells were starved with the appropriate nutrient-deficient medium for 1 h, labelled for 2 h by adding 100 μCi/ml [^{35}S]methionine or [^{32}P]orthophosphate, washed twice with PBS and lysed in RIPA buffer as described above.

Molecular cloning. The NP open reading frame (ORF) was synthesized from vRNA as described previously (Feldmann *et al.*, 1992) using the following two sets of NP-specific oligonucleotides: (i) a primer set with a *Kpn*I site (underlined), 5′ CAGGGTACCGTGT-ATCATATAAATAAAGAAGAATATTAAC 3′ (mRNA sense, bases 31 to 61), and 5′ CAGGGTACCCCTGCATGTATGATGAGTCCC-ACATTGTGA 3′ (vRNA sense, bases 2967 to 2939) and (ii) a primer set with a *Sal*I site (underlined), 5′ CAGGTCGACGAAGATATGG-ATTTACACAGTTTGTTGGA 3′ (mRNA, bases 98 to 126) and 5′ CAGGTCGACGACCACCATAGTATGCCCAGTCCTTGCCCG 3′ (vRNA sense, bases 2375 to 2347). The numbering is according to the genome position (for reference see EMBL Data Library, emnew: MVREPCYC; accession number Z12132). The fragment obtained by using the primer set with *Kpn*I sites was ligated into the *Kpn*I site of the plasmid vector pAcYM1B (Matsuura *et al.*, 1987). The fragment obtained by using the primer set with *Sal*I sites was ligated into the plasmid vectors pUEX (Bressan & Stanley, 1987) and pSC11 (Chakrabarti *et al.*, 1985). For cloning into pSC11, the plasmid vector was altered by introducing a *Sal*I linker into the unique *Sma*I site of the plasmid (Fig. 1). Following cloning, the entire NP ORF was sequenced in all recombinant plasmids (pUEX–NP, pAcYM1B–NP and pSC–NP) using the chain-terminating inhibitor method (Sanger *et al.*, 1977).

Expression of NP in Escherichia coli *and production of polyclonal anti-NP sera. E. coli* cells were transformed with pUEX–NP. Bacteria were grown at 30 °C and recombinant clones were selected by their ampicillin resistance. For expression studies, bacteria were grown for 5 h at 30 °C in 2YT medium containing 100 μg/ml ampicillin. Expression of the *β*-galactosdase–NP fusion protein (*β*-gal–NP) was

Abstract

Gabon has recently been struck three times by Ebola hemorrhagic fever. The first isolate originating from the 1994 outbreak has been subjected to molecular characterization of its GP and VP24 genes. Sequence analysis demonstrates that the agent, Gabon-94 virus, belongs to subtype Zaire of Ebola virus. The isolate is closely related to the Kikwit-95 isolate, and both viruses seem to have evolved from a progenitor virus different from that of the Zaire-76 isolates. The relatively close relationship of all subtype Zaire viruses isolated at different geographical locations and up to 20 years apart suggests an extreme conservation in the yet unknown natural reservoir of Ebola viruses. The level of genetic variability in the human host might be different as indicated by the comparison of isolates from a single outbreak (Mayinga-76 and Eckron-76), but needs further investigation on clinical material of patients by PCR since both isolates have different levels of passages in tissue culture.

Abstract

During the 1995 outbreak of Ebola (EBO) hemorrhagic fever in Kikwit, Democratic Republic of Congo, two surveys using a new ELISA for EBO (subtype Zaire) virus antigen were conducted to assess the prevalence of EBO IgG antibodies among residents of Kikwit and the surrounding area. The first study determined the proportion of antibody-positive individuals who were self-identified forest and city workers from the Kikwit area. Serum samples from 9 (2.2%) of 414 workers had IgG EBO antibodies. The second study determined the proportion of EBO antibody-positive individuals who lived in villages surrounding Kikwit. The prevalence of IgG EBO antibodies in this population was 9.3% (15/161). The difference in the overall prevalence of EBO antibodies may indicate that villagers have a greater chance of exposure to EBO virus compared with those living in and in close proximity to cities.

Virus lab kept busy

BY SCOTT EDMONDS
Canadian Press

WINNIPEG — Canada's only lab capable of handling the world's deadliest viruses has been mightily tested in the last few weeks, but its officials say it has passed with flying colours.

"It's been an incredibly hectic time," said Dr. Frank Plummer, head of the microbiology laboratory at the Canadian Centre for Human and Animal Health.

Scientists at the high-tech, high-security centre in Winnipeg have been working virtually around the clock, most recently to see if a woman visitor from Africa brought the dreaded Ebola virus into the country.

The woman remains critically ill in a Hamilton hospital, but health authorities no longer fear she may have carried Ebola or a similar disease to North America.

"There's never been an incident like this woman from Congo before," Plummer said Monday.

"There are contingency plans in place to deal with these kinds of things and I think we dealt with it well this time. I'm particularly proud of the job the Level 4 program did here."

The most deadly pathogens, such as Ebola, are classified as Level 4 viruses. They must be handled in special facilities that have the ultimate in safeguards to prevent accidental contamination.

About 16 Level 4 viruses have been identified worldwide so far, most originating in Africa or South America.

The Winnipeg centre, which opened in 1999, is one of only about 15 in the world.

"We were ready for this," said Dr. Heinz Feldmann, head of the special pathogens section. "We hope it's not going to happen often or soon again."

The Hamilton incident followed on the heels of health scares in Toronto, Ottawa and Victoria posed by feared bioterrorist attacks.

Packages containing mysterious substances were sent to government offices in Toronto and Ottawa, and to a Wal-Mart in the Victoria area. In all three cases, the substances were examined at the Winnipeg lab and turned out to be harmless.

"Most of our colleagues in the United States . . . have handled many hoaxes," said Kathryn Bernard, the head of the special bacteriology section. "They're not very common in this country."

Introduction

Infections with filoviruses cause a fulminant haemorrhagic disease in human and non-human primates. Among all of the virus haemorrhagic fevers, Marburg and Ebola virus infections are characterized as the most severe forms, with case-fatality rates ranging from 22 to 90%. The pathophysiological changes that make filovirus infections so devastating are not well understood. The viruses are pantropic, but there is not a single organ that shows sufficient damage to account for either the onset of severe shock syndrome or the tendency to bleed. As in some other virus haemorrhagic fevers, such as haemorrhagic fever with renal syndrome, dengue haemorrhagic fever and Lassa fever, filovirus infections are associated with generalized fluid distribution problems, hypotension and coagulation disorders. Thus, Marburg and Ebola virus haemorrhagic fevers may be compared to a syndrome provoked by systemic treatment with cytokines, which is also seen in endotoxin-induced shock (Feldmann & Klenk, 1996[R12]; [**Dr. Clarence James Peters (born 1940)**] et al., 1996[R45]; Schnittler & Feldmann, 1999[R55]

UTMB to break ground on BSL4 lab

From staff reports

University of Texas Medical Branch at Galveston officials will break ground Friday on the first full-sized maximum biological containment facility-Biosafety Level Four Laboratory on a university campus in the United States.

The $15.5 million maximum containment facility — a BSL4 — is dedicated to the study of tropical and emerging infections.

It is designed to allow researchers to "safely and effectively work with the most hazardous organisms that you can imagine," said Dr. C.J. Peters, director of the laboratory.

Peters, a professor of pathology, microbiology and immunology, also heads and of UTMB's new Center for Biodefense.

The BSL4 is a 12,000-square-foot facility. The laboratory itself, which is sometimes compared to a submarine inside a giant bank vault, will be just 2,000 square feet. The other 10,000 square feet of the facility will contain equipment designed to capture and destroy any microbes before they can escape the structure.

Peters said one major thrust of the laboratory would be to extend the work of the more than 26 UMTB researchers led by Professors Robert E. Shope and David G. Gorenstein.

They have received more than $11 million in federal grants over the past four years to develop countermeasures against viruses that experts fear bioterrorists may employ.

"If we're going to deal with the threat of biological terrorism or biological warfare, we're going to have to have a concerted scientific effort — and that effort doesn't have to be where these terrorists exist — it can be anywhere," Peters said.

"In Galveston, we have a health sciences university that has a very strong basic sciences program, the Sealy Center for Structural Biology, the Sealy Center for Vaccine Development, the Center for Tropical Diseases and the Center for Biodefense. So the Center for Biodefense can draw on the expertise of these other centers to deal with what are basically infectious disease problems."

Peters, a native Texan, was formerly chief of special pathogens in charge of the BSL4 laboratory at the Centers for Disease Control and Prevention in Atlanta.

Before that, he had a similar role supervising the BSL4 laboratory at the U.S. Army Medical Research Institute of Infectious Diseases in Frederick, Md.

Peters has traveled extensively in South America and Africa investigating viral outbreaks. In the United States, he headed the unit that contained the 1989 Ebola virus outbreak in Reston, Va., and he was a key member of the team that tracked down the Hantavirus that caused mysterious deaths in rural New Mexico.

He is author, with Mark Olshaker, of Virus Hunter: Thirty Years of Battling Hot Viruses Around the World.

A specially trained staff will maintain the BSL4 facility, and these individuals will also take over maintenance of the existing Biosafety Level Three laboratories, said Lee H. Thompson, UTMB safety officer for biocontainment facilities.

Thompson previously worked on construction and commissioning of BSL4 laboratories in Canada, Sweden and India. He also will be in charge of training both scientific and maintenance staff in the safe operation of the facility.

UTMB's full-sized BSL4 — in which researchers will work inside the laboratory in pressurized suits — will be a first on an American university campus, but it isn't the first such facility on a campus anywhere in the world.

That distinction belongs to the university in Marburg, Germany.

Here in the United States, meanwhile, the University of Georgia operates a small facility known as a "glove box" BSL4, in which investigators insert their hands in special gloves to do their experiments while the rest of their bodies remain outside the small BSL4 containment zone.

Mike Shriner, UTMB's chief facilities officer, said construction should begin soon.

"Bids from contractors have been received, and we plan to award the construction contract and begin construction in March," he said.

He said the facility is scheduled to be completed and commissioned in June 2003.

Construction of the BSL4 is funded in part by a grant from the Sealy & Smith Foundation of Galveston, a philanthropy solely dedicated to benefiting UTMB, with additional support from other sources.

A second major component, building and updating support facilities for the laboratory in the adjacent Keiller Building, was funded by a $3 million grant from the National Institutes of Health.

WHAT: Groundbreaking ceremony for the BSL4.
WHEN: 3:30 p.m. Friday.
WHERE: By the Keiller Building, near Old Red on the University of Texas Medical Branch campus.
DETAILS: The ceremony is open to the public.

Who's who

UTMB President John D. Stobo will preside at the ceremony, which will be attended by a number prominent medical officials. They include:

- Maj. Gen. Phillip K. Russell, U.S. Army, retired, now a senior official in the Office of Homeland Security.
- Jim Hughes, director of the National Center for Infectious Diseases of the Centers for Disease Control and Prevention in Atlanta.
- Peter B. Jahrling, deputy commander of the U.S. Army Medical Research Institute for Infectious Diseases.
- Karl M. Johnson, former director of the Biosafety Level Four Laboratory at the CDC in Atlanta.
- Heinz Feldmann, director of Canada's new Biosafety Level Four Laboratory in Winnipeg.
- Michael Kiley, chief biosafety officer for the U.S. Department of Agriculture.

Taiwan's health chief resigns over SARS

TAIPEI, Taiwan (AP) — The escalating SARS crisis in Taiwan cost the health chief his job Friday, as he quit to take responsibility for the rapid spread of the virus that has forced the closing of two hospitals.

He was the second top Asian health official to lose his job because of SARS; mainland China's health minister resigned a month ago, and more than 100 other Chinese officials have been punished or fired because of SARS, according to Xinhua news agency.

Taiwan Health Department boss Twu Shiing-Jer will be replaced by a respected epidemiologist, Chen Chien-jen, who studied at Johns Hopkins University in the United States.

Meanwhile, the World Health Organization reported details of how a huge apartment outbreak in Hong Kong in March was caused by sewage leaks and powerful ventilation fans sucking the virus inside homes.

And in China, the government said it was suspending foreign adoptions to help curb the disease. Paperwork on adoptions will continue, but Beijing has stopped authorizing prospective parents to come there.

Severe acute respiratory syndrome has infected 7,700 people worldwide and killed at least 613. It is continuing to spread through Taiwan, although new infections are on the decline elsewhere.

On Friday, health officials said the disease had killed three more people, including two doctors. Taiwan reported 10 new cases for a total of 274, and its death toll rose to 37.

In Singapore the prime minister said a suspected cluster of new SARS cases at a mental health facility was a false alarm. He expressed hope the WHO would be able to declare the city-state SARS-free on Sunday.

"I am 99 percent sure they are not suffering from SARS," Prime Minister Goh Chok Tong told reporters.

One of Taiwan's top SARS fighters warned more cases were about to erupt.

Lee Ming-liang, head of the government's SARS Control Committee, said more infections were expected as the result of the two most recent hospital outbreaks, at Taipei's National Taiwan University Hospital and at Chang Gung in southern Kaohsiung city.

Illustrating the random nature of many SARS outbreaks, most of Taiwan's 274 cases of the respiratory disease can be traced to one woman's 40-minute stay in a Taipei emergency ward, a doctor said Friday.

The woman was four days into her SARS infection, said Dr. Yeh Chin-chuan, an adviser to the Taipei city government.

The woman's brief hospital stay set off a chain of events that ultimately caused outbreaks at four Taiwanese hospitals where dozens of people were sickened, Yeh said in a report released Friday.

A report by WHO investigators into Hong Kong's Amoy Gardens outbreak, which was concentrated in a building called Block E, blamed an "unlucky" combination of circumstances — a patient with diarrhea, seeping pipes and drafty air shafts.

The WHO's findings largely confirm an earlier Hong Kong report.

"It's just an accumulation of events," team leader Dr. Heinz Feldmann told a news conference Friday. Feldmann said there was no way to guarantee against a repeat, but another one seems "unlikely."

More than 300 people contracted the illness in the apartment complex in late March, and hundreds more were quarantined. Thirty-five residents died.

A bargain is a bargain even if it is at Amoy Gardens in Hong Kong, centre of a deadly disease cluster

SARS brings out speculators

By Tom Blackwell
in Hong Kong

Not since Hooker Chemical turned the Love Canal neighbourhood of Niagara Falls, N.Y., into a toxic wasteland has a swath of real estate been so tainted by disaster.

The Amoy Gardens housing complex, unknown a couple of months ago outside this city, is now internationally infamous.

But that also means the price of its apartments has plunged, and a bargain is still a bargain. So Hong Kong homebuyers are once again snapping up apartments at the site of the most troubling and unusual cluster of SARS cases in the world.

"People are coming back to the market," said Ivan Ho, head of Ricacorp Properties Ltd., this week at the company's office inside the complex.

"Some people like to do contrary thinking. They are very eager to buy at a very low price. They like to bargain hunt."

It may not be such a risky proposition. Even as Amoy's notoriety lives on, the actual threat of the virus appears to have been banished.

Ricacorp even sold an apartment recently in the dreaded block E, epicentre

'They are very eager to buy at a very low price'

of the outbreak that sickened more than 300 people at the housing estate and killed an astounding 42.

At the height of the crisis in April, speculators tried to buy units for as little as half the going rate of about $200,000, although there were no takers, Mr. Ho said. The fall in value now appears to be more like 15%.

Tony Chan, a souvenir importer, just bought an apartment at Amoy, where his daughter already lives. Does he have any worries? he is asked. Mr. Chan shakes his head and offers a matter-of-fact "No" before rushing off to meet an interior decorator at the apartment.

As the disease spread like wildfire through Amoy in March and April, experts the world over watched in shock. An illness that was supposed to be confined to health care facilities and spread through close contact with patients was suddenly infecting people with no apparent connection to each other, apart from living in the same sprawling apartment complex.

The word "garden" in the complex's name is applied loosely. Amoy is a concrete expanse of 19 high-rise towers housing 17,000 people — typical of the high density needed to cram seven million people into Hong Kong.

Many of the cases were concentrated in a single tower, one apartment on top of the other.

Investigations by Hong Kong authorities and a World Health Organization team made up of Health Canada scientists have come up with explanations centred on the buildings' sewer system. But questions remain unanswered and the incident is a continuing preoccupation of experts.

"I keep thinking that in a year it will be the one thing we'll still be talking about," said Aileen Plant, a professor with the centre for international health at Australia's Curtin University.

"It's one thing that doesn't quite fit with everything else."

Exactly how the virus spread is more than just a curiosity to Liu Ka Fai, an athletic-looking electronics engineer who was among the hundreds of block E residents forced into quarantine camps for 10 days in April.

Across the hall from his tiny 15th floor apartment lived the Fongs, a middle-aged couple and their 13-year-old daughter — friendly people who had delivered a gift and greetings to him a few weeks earlier at Chinese New Year.

Mr. Fong came down with SARS on March 27, followed by his daughter. When remaining residents were dispatched to the camps on March 31, Mrs. Fong was still healthy. Mr. Liu traded cellphone numbers with her and they kept in touch from their different camps.

Mrs. Fong finally contracted SARS on April 7, but even then they remained in contact. Mr. Liu last heard from her on April 19.

He was back in his apartment in mid-May when the teenage daughter and her uncle showed up at the building. Mr. and Mrs. Fong had died.

"The daughter still didn't know her parents were dead," Mr. Liu said. "They didn't know how to tell her."

Many residents of the complex, especially those who lost relatives, are bitter at the Hong Kong government, said Yip Hing Kwok, president of the Amoy owners committee.

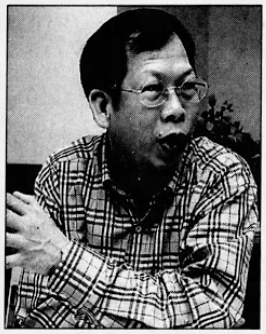
The authorities should have moved to quarantine the building as soon as the first batch of cases cropped up on March 26, he said in an interview. Instead, the isolation was not ordered until after Mr. Yip made a public appeal for such action on March 31.

"The reaction of the government of Hong Kong in the early stages was very poor, very slow," he said.

As for the cause of the calamity at Amoy Gardens, the WHO team headed by Dr. Heinz Feldmann of Health Canada highlighted a number of factors that combined to accelerate the spread of the disease.

PETER PARKS / AGENCE FRANCE-PRESSE

Heinz Feldmann, centre, of Health Canada speaks to reporters outside Amoy Gardens housing complex in April.



NATIONAL POST

Initial government reaction to SARS was poor, says Yip Hing Kwok, president of the Amoy owners committee.

A 33-year-old man from mainland China, who contracted the disease after visiting the first hospital in Hong Kong to become contaminated, came to visit his brother in block E twice in mid-March.

He was suffering from diarrhea and used the washroom in his brother's apartment. It appears that fecal particles containing the SARS virus were drawn up the "sewage stack" that serves each of the apartment units.

Each bathroom has a floor drain, under which is a U-joint designed to stop foul smells and insects from entering the bathroom from the sewage stack. But because people no longer washed their floors with water and instead simply wiped them clean, there was no water sitting in the U-bends, making the barriers ineffective.

Inside the bathrooms, meanwhile, exhaust fans that Dr. Feldmann said are too powerful may have sucked those fecal particles out of the drains. The fans vented into a light well between apartments, but the apartment units are so close some of the particles may have been propelled into the bathroom windows of facing apartments.

Although it was a unique event, it could be repeated if SARS returned and the factors combined once more, Dr. Feldmann said. Canadian buildings are not susceptible, though, because of differences in building design, including windows that open on to a light well in an environmentally friendly configuration, he said.

"These buildings in Hong Kong, they don't need any heating, they don't need any air conditioning, because they just ventillate by natural wind, and that is pretty good," Dr. Feldmann said.

"But they obviously didn't think about SARS coming one day, and that this could bring problems."

7. Conclusions

In addition to causing illness and death, a biological attack would aim to cause fear in the general populace and, thus, result in social and economic disruption. Based on their fearsome reputation and dramatization by the popular media, VHF agents would be excellent candidates to serve this purpose. Given the potential for a biological attack to occur, it is of the utmost importance that resources and knowledge are made available to deal effectively with such a situation in a safe and timely manner.

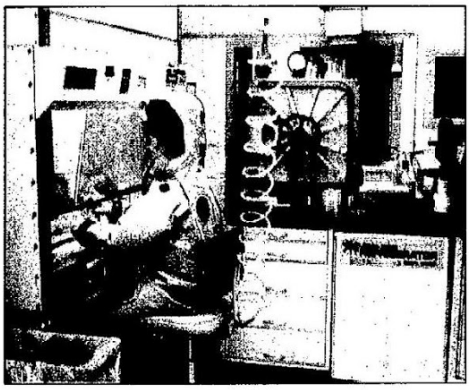
Electron micrographs of Ebola virus

BREAKTHROUGH!

Scientists have developed vaccines effective in monkeys against both the Marburg and Ebola viruses

By JAMES RADA | *News-Post Staff* | jrada@fredericknewspost.com



Staff photo by Sam Yu

Joan Geisbert, a lab technician at USAMRIID at Fort Detrick, works with Ebola virus in one of USAMRIID's bio safety level 4 labs in this photo from 2002. These labs are reserved for the most dangerous organisms. Scientists from USAMRIID and the Public Health Agency of Canada have recently developed vaccines against the Marburg and Ebola viruses.

FREDERICK — Last fall, after decades of civil war, Angolans faced a new enemy. This one was unseen and killed from within.

The new enemy is the Marburg virus. It can kill 90 percent of its infected victims quickly and painfully. It can cause internal organs to liquefy, skin to bubble up, and victims to weep tears of blood, according to Richard Preston in his book "The Hot Zone."

More than 215 people have died in Angola since the Marburg virus outbreak began last fall. While very little can be done to stop this outbreak, future "hot zones" may see some cooling with help from Frederick and Winnipeg, Canada.

Scientists from the U.S. Army Medical Research Institute of Infectious Diseases and the Public Health Agency of Canada have developed the first vaccines against both the Marburg and Ebola viruses that protect monkeys.

"We've made more progress in three years than we probably made in the previous 20," said Dr. Thomas Geisbert with the U.S. Army Medical Research Institute of Infectious Diseases at Fort Detrick.

Mr. Geisbert, along with Canadian researchers Dr. Heinz Feldmann and Dr. Steven Jones of PHAC's National Microbiology Laboratory, developed the vaccines after four years of work on the problem. This month's *Nature Medicine* journal published their study.

Ebola and Marburg viruses are emerging pathogens that cause hemorrhagic fever with high mortality rates in humans and non-human primates. Since monkeys develop hemorrhagic fever symptoms similar to humans, a safe and effective vaccine for monkeys shows promise for human use.

"When you see the tragedies these viruses cause, it's very frustrating that we can't do more to help people," said Mr. Feldmann, who has been providing on-site rapid diagnostic support to the cur-

(See BREAKTHROUGH A-11)

Breakthrough

(Continued from A-1)

rent Marburg outbreak in Angola. "It'll be some time before we can use these vaccines in the field, but it's satisfying to know that we're getting closer."

Though the new vaccines show promise, Mr. Geisbert said it would be at least five years before a human vaccine is ready.

The vaccine is developed by replacing a surface protein in an animal pathogen, called vesicular stomatitis virus, with a surface protein from either the Ebola or Marburg viruses. The Canadian researchers conducted the mice and guinea pig testing, but collaborated with USAMRIID to prove the vaccine effective in monkeys.

"One of the problems you have is that only a certain number of facilities are capable of level four containment," explained Mr. Geisbert. If you add into the need that kind of containment with non-human primate research, the number of facilities drops even more, he said.

The goal is to find a way to deliver the non-lethal virus into the body and have the body generate an immune response to the virus. The use of the vesicular stomatitis virus as a delivery system was so successful that the researchers are studying if it can be used with other viruses. Researchers are also seeing promising results at developing the vaccines into forms that can be taken orally or with a nasal spray.

"This speaks volumes about the dedication and expertise of these individuals, and also what can be achieved through international collaboration," said Canadian Health Minister Ujjal Dosanjh.

Dr. Carolyn Bennett, Minister of State (Public Health) added that people "everywhere could benefit from the vaccine development, in stopping outbreaks where they originate as well as reducing the risk that these viruses will be used in bioterrorism."

Though these viruses don't spread easily, they are very deadly. It is this fact that has made them attractive as a terrorist weapon.

"We know that the former Soviet Union was trying to develop it as a weapon," Mr. Geisbert said. "That's where the fear comes from."

Colonel Erik Henchal commander of USAMRIID, said the study illustrates the benefits of collaborative research to develop medical countermeasures for biodefense. "Relationships like this contribute to better science and ultimately better protection for military service members and civilians alike."

Bug-busters 'successful'

City scientists help contain ebola outbreak in Congo

By Meghan Hurley

WINNIPEG scientists from the Public Health Agency of Canada believe they have helped contain an outbreak of the deadly ebola virus in a remote region of the Democratic Republic of Congo.

"To me, it was definitely successful," said Dr. Heinz Feldmann, head of the special pathogens division of the National Microbiology Laboratory in Winnipeg. "The outbreak was contained really rapidly because of all of the people involved."

So far, the Winnipeg-built portable labs have confirmed 26 cases of ebola, Feldmann said during a press conference Monday at the Canadian Science Centre for Human and Animal Health.

"Even if we only save one life it's worth the effort," Feldmann said.

The virus is spread through direct contact with infected blood or through sexual contact with an infected person. There is no medicine, treatment or cure for the virus.

Ebola is characterized by a high fever, intense weakness, muscle pain and a sore throat. It progresses quickly, usually causing vomiting, diarrhea, and impaired liver and kidney functions.

The scientists helped to differentiate ebola from illnesses with similar symptoms, Feldmann said.

Feldmann and two colleagues were sent to Mweka in September. A second team went to Kampungo in October to set up the mobile labs, which can be easily deployed on short notice.

The first team returned to Canada on Oct. 11 while the second is still in Kampungo.

The team sent to Kampungo will return to Canada in the next few days since the outbreak has been successfully contained, Feldmann said. But the outbreak hasn't been officially declared over, he added.

It has been almost 21 days now with no new cases, said Kelly Keith, Public Health Agency of Canada spokesperson.

"One case can start the outbreak all over again but 21 days is a safe time frame to pull out," Feldmann said.

Despite the success of containing the disease, the team members faced several challenges while working in a third world country.

Transporting the lab to the designated sites was one of the biggest challenges the teams faced, Feldmann said.

"In the future, we have to think about putting the weight down of what we transport and still provide good service," he said.

In the past, the mobile labs have been used to respond to outbreaks such as SARS, Keith said.

BRANDON SUN

THURSDAY JANUARY 24, 2008

Researchers help create 'safe' Ebola

WINNIPEG — Two Winnipeg researchers have helped develop a "safe" form of the deadly Ebola virus that is about as dangerous as a common flu bug.

Dr. Heinz Feldmann, head of special pathogens at the Winnipeg-based National Microbiology lab, and Dr. Hideki Ebihara worked with scientists from the University of Wisconsin to genetically alter the live Ebola virus so more scientists could safely study the pathogen.

Now, the altered Ebola virus can be studied in a lab without biohazard suits or airtight lab chambers.

Ebola is classified as Level 4 pathogen — a category that includes the world's most dangerous viruses.

Feldmann said Canada's National Microbiology Lab in Winnipeg has the only Level 4 biocontainment lab in the country, and there are few labs in the U.S. and elsewhere that can safely study Ebola.

That has hampered efforts to develop a vaccine for the virus, which most recently killed over 160 people in the Democratic Republic of the Congo.

Ebola is spread through direct contact with an infected person's blood or through sexual contact. There is no cure or vaccine, and between 50 and 90 per cent of people who contract Ebola will die.

The latest research on the new, safe Ebola virus was published in a scientific journal this week.

"There's only a few laboratories that can actually work with the live virus, so that was actually the goal of (this) study," Feldmann said.

Feldmann said researchers have been trying to better understand Ebola for decades, but have had a hard time since few scientists are actually able to study the live virus.

Feldmann said scientists deleted one of Ebola's seven genes, VP30 — a gene protein that is necessary for the virus to replicate and cause disease.

Experimental vaccine used in Ebola case

Accidential stick | Experts consulted included Dr. Heinz Feldmann, chief of virology at the Rocky Mountain Laborattories in Hamilton, MT

By MELISSA EDDY and MIKE STOBBE
Associated Press

BERLIN — It was a nightmare scenario: A scientist accidentally pricked her finger with a needle used to inject the deadly Ebola virus into lab mice.

Within hours, members of a tightly bound, yet far-flung community of virologists, biologists and others were tensely gathered in a trans-Atlantic telephone conference trying to map out a way to save her life.

Less than 24 hours later, an experimental vaccine — never before tried on humans — was on its way to Germany from a lab in Canada.

And within 48 hours of the March 12 accident, the at-risk scientist, a 45-year-old woman whose identity has not been revealed, was injected with the vaccine.

So far, so good. If the woman is still healthy by Thursday, she can consider herself safe.

Ebola hemorrhagic fever, seen mostly only in Africa, is one of the world's most feared diseases. It begins with flu-like symptoms, followed by bloody diarrhea and vomiting. Days later, some victims begin bleeding through the nose, mouth and eyes. Depending on the strain of virus, it can kill up to 90 percent of victims.

There is no cure. The virus is spread through direct contact with the blood or secretions of an infected person.

Dr. Stephan Guenther, head of the Bernhard Nocht Institute for Tropical Medicine in Hamburg, where the researcher was working, said tests so far show the scientist is healthy and free of the virus.

The peak period for an outbreak during the 21-day Ebola incubation period passed this week, he said.

"We are now on the downside," Guenther told The Associated Press, noting that with each passing day the chance of infection taking root diminishes.

It's not entirely clear the researcher was actually infected with the virus. At the time of the accident, she was wearing three layers of protective gloves, and though the needle stuck her, the plunger of the syringe was not pushed so it's not certain the virus entered her bloodstream.

That means scientists may never know if the vaccine worked or she was just lucky.

There are two other known accidents involving researchers who came into direct contact with a similar strain of Ebola. A Russian researcher died, and a British scientist became ill but survived.

After the needle stick, Guenther knew he had to act swiftly.

He rushed an e-mail to fellow scientists in the Ebola research community. One was Dr. Heinz Feldmann, chief of the virology laboratory at the Rocky Mountain Laboratories, a U.S. National Institutes of Health research facility in Hamilton, Mont.

"We considered this as serious as (the Russian) case, in terms of the exposure," Feldmann told the AP in a telephone interview last weekend.

Feldmann was part of an international group of experts from the U.S. Centers for Disease Control and Prevention, the U.S. Army Medical Research Institute of Infectious Diseases, the Canadian Public Health Agency, Boston University and the University of Texas Medical Branch.

Feldmann, Guenther and several other experts took part in the teleconference debating the options. These included a live vaccine never before tried on humans, another treatment designed to interfere with the virus' ability to multiply, or an anticoagulant that Army research found had saved the lives of monkeys exposed to Ebola.

The option that emerged as the strongest was the vaccine, which had been developed by Feldmann and collaborating researchers at several institutions. Much of the key work was done about nine years ago at a microbiology research lab run by the Canadian government in Winnipeg, Manitoba, where Feldmann worked at the time.

Although the vaccine is based on a different kind of virus, researchers used genetic engineering to make the virus look like Ebola, triggering an immune system response.

Researchers who work with high-risk viruses hope emergency use of Winnipeg-made vaccine in a lab worker in Germany will help spur development of emergency supplies.

Scientists have high hopes for Winnipeg Ebola vaccine

By Helen Branswell

TORONTO — The emergency use of a Winnipeg-made Ebola vaccine may have breathed new life into stymied efforts to get experimental vaccines for Ebola and similarly deadly viruses made, scientists say.

They are hoping to strike while the iron is hot, using heightened awareness of the risk these dangerous viruses pose to press for production of emergency stocks of vaccine and potentially even expensive human clinical trials.

The Ebola vaccine, made at the National Microbiology Laboratory in Winnipeg, was given to an unnamed German researcher last month after she accidentally pricked herself with the needle of a syringe containing Ebola virus. The woman, who did not develop symptoms of the disease, was given the all-clear by her doctors late last week.

"There is a lot of interest at the moment and some people find it positive that... the vaccine was offered and actually given to her," says Dr. Heinz Feldmann, who led the team that designed the Ebola vaccine as well as one for a cousin virus, Marburg.

"The question remains the money."

Ebola and Marburg viruses trigger ghastly viral hemorrhagic fevers that kill between 50 and 90 per cent of people who become infected.

The tight-knit circle of scientists who work on these viruses has been frustrated in efforts to push experimental vaccines through the testing pipeline to the point where they could be used.

Despite promising results in animal trials, major financial, logistical and regulatory hurdles impeded their development. The community of researchers sees the German case and the need it identifies as a chance to finally break the logjam.

"I'm hopeful," says Feldmann, who is now chief of the laboratory of virology at the U.S. National Institute of Allergy and Infectious Diseases' Rocky Mountain Laboratories in Hamilton, Mont.

He and colleagues in the field hope the vaccines can eventually be used to halt the devastating outbreaks that can wipe out whole African villages. They also hope the vaccines could be used to save great apes, which also fall prey to these pathogens.

But the scientists, who work with some of the most dangerous pathogens known, also have a keen self-interest.

"We would all love to vaccinate ourselves. We're just not allowed to," says Tom Geisbert, who led the animal testing on nearly all of the current experimental vaccines while working at the U.S. Army Medical Research Institute of Infectious Diseases at Fort Detrick, Md.

They envisage the lab emergency equivalent of an EpiPen, the adrenaline injector carried by people who have allergies that can trigger anaphylactic shock.

The Winnipeg-made vaccines would likely be the product of choice for a lab-accident response. They are the only Ebola and Marburg vaccines shown to improve survival chances after exposure to the viruses, unlike standard vaccines which require pre-exposure administration.

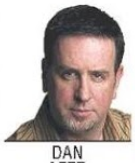
Tories drop ball on lab upgrade

A few theories why expansion on shelf

GOVERNMENT OF CANADA PHOTOS

Expanding the city's National Microbiology Laboratories (above) would be a win-win move.



DAN LETT

IN the 2006 federal election campaign, desperate Liberals unveiled a goody bag of pledges for Manitoba to stave off defeat at the hands of the surging Conservatives.

There was money for an expanded Red River Floodway, funding for the Canadian Museum of Human Rights, and a $125-million expansion of the Winnipeg-based Canadian Science Centre for Human and Animal Health, home to the National Microbiology Laboratories and headquarters of the Public Health Agency of Canada (PHAC).

Manitoba Tories were circumspect about how they would treat these pledges. "A Stephen Harper government takes Manitoba issues very seriously," said Conservative party president Don Plett, one of Manitoba's most influential Tories. "We're not going to turn our backs on any important issue."

Three years later, Plett's pledge appears reasonable. All the money for the floodway was provided. And Harper not only matched the Liberals on capital funding for the human rights museum, but added annual operating grants.

However, the Tories have failed profoundly on the lab expansion. The plan envisioned a new laboratory wing and a lowrise office tower. Ottawa put $250 million in its last budget to upgrade federal laboratories, but could find only $24 million to expand the Winnipeg lab's loading dock.

To characterize that announcement as a disappointment would be a gross understatement. Many are left to wonder why the federal Conservatives would turn their backs on one of Manitoba's most important federal facilities. Theories abound.

One theory holds that federal Tories are simply unwilling to increase funding for science and technology in these economically trying times. In January's federal budget, funding for research and development was cut. It was a particularly bad decision, given the fact the European Union and the United States are massively increasing science funding as a key component of recession-fighting stimulus programs.

Another theory says that federal Tories, including Manitoba's senior cabinet minister Vic Toews, believe Manitoba has received more than its fair share of federal funding through the floodway and the human rights museum.

Under pressure to find money for a wide range of priorities, Toews has been inexplicably aloof about the lab expansion, and it's possible he believes it's too big a ask on the heels of the floodway and human rights museum.

A final, perhaps more credible theory suggests that Health Canada is blocking the lab expansion as part of a dispute over who actually controls PHAC.

Health Canada fought the original decision to build the lab in Winnipeg. Years later, resentment over that decision manifested in an all-out effort to stop the Liberals from locating the PHAC headquarters in Winnipeg. The Liberals believed it was better to locate Canada's top scientists and public health experts away from the stifling bureaucracy of Ottawa.

Nearly four years later, however, and it's quite clear that Ottawa isn't giving up without a fight. During the H1N1 flu virus scare, Dr. David Butler Jones, the chief medical officer of health, and Dr. Frank Plummer, the director of the National Microbiology Laboratories, have been anchored in Ottawa while scientific work is done in Winnipeg.

The optics could not be clearer. It would be infinitely more difficult to fight Winnipeg for control of PHAC if the Winnipeg laboratory were improved and expanded.

However, Health Canada is oblivious to the fact an expanded lab is a critical issue for some of the world's best and brightest scientists.

When the proposal was made to expand the Winnipeg lab, one of the main reasons was that the top scientists working there needed more space and unless they got it, they would leave.

Last year, quietly and without fanfare, Dr. Heinz Feldmann left the NML and the University of Manitoba for the Rocky Mountain Laboratories, a U.S. National Institutes of Health research facility in Hamilton, Montana, to continue his research into a vaccine to treat hemorrhagic fevers like Ebola. Feldmann made international headlines when he developed a vaccine prototype working out of the Winnipeg lab.

Now, he toils in the U.S., where he has more money and access to a much larger Level 4 laboratory. Feldmann has never spoken publicly about his decision, but the motivation seems clear.

Whether the decision to shelve the laboratory expansion is due to cynical regional politics, a failure to recognize the economic importance of investments in science, or a failure to curb Ottawa bureaucrats, the Harper government has dropped the ball here.

Expanding the NML is good for Manitoba, good for science and good for Canada's economy. Perhaps one day the folks in Ottawa will see that and get out of the way.

Secure lab tightens restrictions

WINNIPEG — Researchers in Winnipeg's National Microbiology lab must now obtain extra approval before they transport lethal pathogens, after a "miscommunication" three years ago left senior officials scrambling to find out why a shipment of Level 4 viruses was sent out of the secure lab.

In the summer of 2008, one of Winnipeg's prominent disease researchers froze vials of some of the world's deadliest pathogens — including Ebola — in liquid nitrogen and packed them in special containers to ship to the United States.

At the time, Dr. Heinz Feldmann worked in Canada's National Microbiology Laboratory special pathogens unit, the only facility in the nation with a Level 4 containment lab where researchers wear special hazardous-material suits and work with lethal viruses behind multiple layers of sealed, air-tight doors. He had accepted a job at a Level 4 U.S. federal lab in Montana, and planned to take his research with him.

The lab does not ship live viruses very often, and officials say this particular shipment was a significant size — about one-tenth of the high-containment lab's total virus stock.

But there was a problem.

While Feldmann's supervisor knew about the shipment and was present on the day he sent the viruses out of the lab, other senior lab staff — including the Level 4 lab's acting director and scientific director, Dr. Frank Plummer — had no idea.

When they noticed the viruses had been shipped, they scrambled to find out what had happened. Officials will not clarify what day Feldmann shipped the viruses and what day lab staff raised concern about them due to "safety and security reasons."

Documents obtained through an access to information request reveal the lab quietly launched an internal investigation about the shipments. All but five of the 149 pages related to the review are blacked out due to sections of the Access to Information Act that allow the government to refuse information that may harm international affairs, was obtained in confidence from a foreign government or institution or could harm third parties.

The Winnipeg Free Press has filed a formal complaint with the Office of the Information Commissioner of Canada.

Potential Nipah vaccine passes primate test

Virus is carried by fruit bats

By University of Texas Medical Branch
Special to The Daily News

» GALVESTON

Researchers have successfully tested a vaccine for the deadly Nipah virus in monkeys, raising hopes that it could provide similar protection for humans.

With greater than a 75 percent fatality rate and the ability to be transmitted directly from person to person, Nipah has long been a significant concern for infectious disease experts.

The virus, which is carried naturally by fruit bats, was first discovered in Malaysia in 1998. Outbreaks have occurred in nearly every year since, in Singapore, Bangladesh and India.

"This vaccine is based on a protein from Hendra virus, which is a very close relative of Nipah — Hendra's found in Australia and is also spread by bats, which give it to horses, which give it to people," said University of Texas Medical Branch at Galveston professor Thomas Geisbert, senior author of a paper on the study now online in Science Translational Medicine. "We've got a lot of confidence that the vaccine will work in people because the animal model we used in this experiment, the African green monkey, faithfully reproduces all aspects of human Nipah and Hendra disease."

Because there is no approved vaccine or therapy for Nipah, the researchers conducted their study in a biosafety level 4 "spacesuit" facility at the National Institutes of Health's Rocky Mountain Laboratories in Hamilton, Mont. There, the scientists divided nine monkeys into three equal groups, administering a different vaccine dose to each group.

Forty-two days later, the researchers infected the animals with what should have been a lethal dose of Nipah. But all of the vaccinated monkeys — even those that had received the lowest dose of the vaccine — remained completely healthy.

"The vaccine worked great," Geisbert said.

The researchers plan further studies to prepare for a possible application for review by the Food and Drug Administration to license the vaccine for human use. In addition, the vaccine is now in commercial development in Australia to protect horses from Hendra virus.

Other authors of the Science Translational Medicine paper include Katharine Bossart and Andrew Hickey of Boston University; Barry Rockx and Joan Geisbert of UTMB; Friederike Feldmann, Doug Brining, Dana Scott, Rachel LaCasse and Heinz Feldmann of Rocky Mountain Laboratories; and Yan-Ru Feng, Yee-Peng Chan and Christopher Broder of the Uniformed Services University of the Health Sciences. Support for this research was provided by the National Institute of Allergy and Infectious Diseases and the NIH.

2013 (Jan 21) - Hamilton researchers help make breakthrough on Ebola vaccine

Jan 21, 2013 Updated Nov 23, 2014 / Source : [HN01IH][GDrive] / By DAVID ERICKSON Ravalli Republic

[HN01II][GDrive]

HAMILTON – Researchers at the National Institute of Allergy and Infectious Disease's Rocky Mountain Labs in Hamilton, working in conjunction with a team in Oregon, have made an important discovery related to a potential Ebola vaccine.

Dr. Heinz Feldmann, chief of the Laboratory of Virology at RML, and Andrea Marzi, a staff scientist who designed the research project, believe they have learned how an experimental Ebola vaccine protects against infection in nonhuman primates — monkeys — which is the best model for human Ebola disease.

Feldmann has a long history with Ebola. He started researching a vaccine more than 10 years ago while he was working in Canada, and the vaccine has been successfully tested on rodents and monkeys. However, one key question remained about why the vaccine was successful: Did the vaccine work because of the "killing action" of the immune cells or through antibodies that neutralize the virus?

The results of the study by Feldmann, Marzi and a team of researchers at Oregon Health and Science University found that the vaccine indeed elicits antibodies that can protect animals against Ebola infection. The scientists used another virus, vesicular stomatitis virus, to produce the sole surface proteins from Ebola after immunization so that the animals' immune system can recognize the foreign protein and fight off the virus if they were ever infected.

The results were published recently in the prestigious journal Proceedings of the National Academy of Sciences.

Ebola causes severe hemorragic fever in humans, which includes profuse internal organ bleeding, and up to 90 percent of people who are infected die from shock, bleeding and multiple organ failure. There currently is no licensed treatment or vaccine for Ebola, which is why this study is so important for moving toward a clinical trial with humans.

In 2012, the World Health Organization reported Ebola hemorrhagic fever outbreaks in the Democratic Republic of Congo and Uganda, accounting for more than 100 cases (probable and confirmed) and numerous deaths. Feldmann said Ebola and its cousin Marburg are a huge concern for the scientific community and governments around the world because the potential for importation of infections and misuse of the virus would be challenging for any public health system.

The viruses originated in Africa and are believed to be transmitted to humans through bats. The scientists also have successfully tested the experimental vaccine against Marburg.

Feldmann said there is a lot of efficacy data, or success, in the nonhuman primate model to support the next step in testing the vaccine.

"We know it works very well, and we hope we can get into clinical trials," he said. "We did not know why it worked. The body has two big weapons to fight viral infections. Cellular immunity means immune cells that kill incoming viruses, or antibodies that would neutralize the virus. The question was what is this vaccine mediating in an immunized host? Is it triggering one or the other or both? Andrea and the Portland team show very elegantly in their study that it is the antibody that is important.

"This has huge implications not only for this vaccine platform, but also for the field in general. The general thinking was that antibodies are not important for Ebola. Not every Ebola vaccine that has been tried might not work with the same mechanism, however."

Feldmann said that the study also defined what scientists call a "correlate of protection."

"We could go into humans and we know what kind of an antibody response we need to achieve in a human, so we can predict that the antibody is working should we have to use it in a human," he explained. "We know what to test for should we go into humans. These are the two key findings."

EBOLA

How Canada's national lab became a powerhouse

HELEN BRANSWELL
THE CANADIAN PRESS

TORONTO — When Dr. Frank Plummer talks about the first experimental Ebola drug used in an outbreak, he pronounces it "Zed Map."

"I do it consciously," says Plummer, who retired this year after serving for nearly 14 years as the head of Canada's National Microbiology Laboratory in Winnipeg.

The rest of the world says the first letter of the drug ZMapp the way Americans do, calling the concoction of three Ebola antibodies "Zee Map." But the cocktail was created in Winnipeg and Plummer thinks the name of a made-in-Canada drug ought to pronounced the Canadian way.

Winnipeg — half a world away from the countries in Africa where Ebola and its viral cousin, Marburg, occasionally slip out of their animal reservoir to start infecting and killing people as Ebola is now doing in West Africa.

They are two of the worst viruses known to humankind, as evidenced by the current outbreak, which has infected at least 5,335 people and killed at least 2,622. To date, there has never been a case of either viral infection within Canadian borders.

So why then is Canada's national lab an Ebola research powerhouse? Well, there's ZMapp, the most promising of the current experimental treatments. There's also an Ebola vaccine that may be useful both to prevent infection and stop it in its tracks if given shortly after exposure. And a mobile diagnostic lab that has changed the way outbreak testing is done.

If you ask why Winnipeg — why Canada? — is such a player in Ebola research, the instant answer comes in the form of two names — Heinz Feldmann, the lab's first special pathogens chief and Gary Kobinger, his successor and the current branch chief.

"They have the right attitude. They're collaborative, they're co-operative, they share their information readily and they have a global perspective. And they know exactly what needs to be done," says Jim LeDuc, director of the Galveston National Laboratory at the University of Texas Medical Branch, which also employs key Ebola researchers.

Still, the story doesn't begin with Feldmann and Kobinger.

When the federal government decided to build a state-of-the-art laboratory in Winnipeg to replace aging Health Canada facilities in Ottawa, it was not immediately clear the complex would contain a Level 4 lab, the high-containment space needed to work on the world's most dangerous pathogens.

"We really felt that to be properly prepared for all of the possible diseases that we were seeing spreading ... that it was better and wise for Canada to have a Level 4 lab," recalls Dr. Harvey Artsob, who was then the head of zoonotic diseases for what became the National Microbiology Laboratory, or NML, as the scientists call it.

The search began for someone to head the special pathogens team.

Lab leaders wanted Feldman, then a young German researcher who was working in Marburg, Germany, researching Ebola and Marburg (the virus is named after the German town where he was working).

The lab flew Feldmann to Winnipeg to meet NML leaders. He liked what he saw, even though the first trip occurred in December.

Under Feldmann, the Winnipeg lab created Ebola and Marburg vaccines that are widely thought to be highly promising. Between 800 and 1,000 vials of the Ebola vaccine, called VSV-EBOV, have been donated to the World Health Organization and will be used in this outbreak if preliminary trials show it is safe in humans. (It is effective and safe in non-human primates.)

The team also created a mobile laboratory, a low-tech-but-safe lab in a suitcase that has revolutionized how testing is done in the remote locations where Ebola and Marburg outbreaks typically occur.

The Winnipeg mobile lab has been deployed by the WHO during most subsequent Ebola and Marburg outbreaks. And many other countries have copied the model. A number of other mobile labs are in the Ebola zone helping with the current epidemic.

Also instrumental in Winnipeg's success was Plummer, who returned to Canada to take over as head of the lab in 2001.

Kobinger — born in Europe but raised in Quebec — was working on an Ebola vaccine at the University of Pennsylvania.

Kobinger has continued work on the Ebola vaccine. But it is with something known as monoclonal antibodies where he's made a major mark.

Our immune systems produce a soup of antibodies to protect against various invaders. But scientists try to figure out which specific ones target a given pathogen, then grow lots of that individual antibody. Those are called monoclonals.

Kobinger and his team produced a cocktail of three Ebola monoclonals that looked promising. He decided to try to optimize the cocktails. The result: ZMapp, which is made up of two of Winnipeg's monoclonals and one made by a U.S. team.

Dr. Gary Kobinger is leaving the Winnipeg lab next June to become the director of the Centre for Research in Infectious Diseases at Laval University in Quebec City.

Ebola scientist leaving city lab

Chief of special pathogens led work on successful treatments

By Helen Branswell

TORONTO — The scientist who led the work to develop the Ebola drug ZMapp is going to be leaving the National Microbiology Laboratory in Winnipeg.

Dr. Gary Kobinger is the lab's chief of special pathogens, heading a team that works on some of the world's worst disease threats. Kobinger will be vacating that position next June to become the director of the Centre for Research in Infectious Diseases at Laval University in Quebec City.

"We're so proud. We consider we are very privileged to have the opportunity to have him," said Dr. Michel Bergeron, the founder and current head of the centre, who is relinquishing the directorship — but staying on as a researcher — after 41 years.

"Gary is a fantastic human being and an extraordinary researcher."

In an interview, Kobinger said the long notice will give the Public Health Agency of Canada time to find the right candidate to take over the special pathogens program, which has brought great acclaim to the national lab.

In addition to ZMapp, the Winnipeg group designed the first Ebola vaccine that has been shown to be effective in people. And it developed and pioneered the use of small mobile laboratories — a lab in a suitcase, essentially — that have changed the way testing is done during Ebola outbreaks.

Kobinger grew up in Quebec and had hoped to return there someday. Still, he said, deciding to step down from the Winnipeg job was difficult.

"It's actually very hard to leave here... A very tough decision," said Kobinger, one of the world's leading Ebola researchers.

"The amount of publications and contributions that this group has been doing... in the past five years is quite impressive."

He has made many contributions to the field of research into viral hemorrhagic fevers such as Ebola and Marburg. But the development of the drug ZMapp will likely be remembered as one of his major contributions during his time in Winnipeg.

The drug is made up of three specific antibodies that fight Ebola. The drug is currently being tested in West Africa, though it is possible the dwindling outbreak there may end before the trial can be completed.

Immune systems produce a variety of antibodies to protect against disease invaders; some are general and some highly specific. To produce monoclonal antibody drugs such as ZMapp, scientists try to home in on specific antibodies, then clone them to produce concentrations of them to infuse into a sick person's bloodstream.

Kobinger and his team produced a cocktail of three Ebola monoclonals that looked promising against the virus in animal testing. Meanwhile, scientists at the U.S. Army Medical Research Institute of Infectious Diseases in Frederick, Md., produced their own monoclonal cocktail of three antibodies. There was no overlap between the two.

Kobinger decided to try to optimize the cocktails, mixing and testing various combinations to see which was most effective when given to primates infected with Ebola. The resulting drug, ZMapp, is made up of two of Winnipeg's monoclonals and one made by the U.S. team.

Kobinger took over as special pathogens chief from the group's first head, Dr. Heinz Feldmann. Feldmann, who left the Winnipeg lab in 2008 to become chief scientist for Level 4 laboratories at the U.S. National Institute of Health's Rocky Mountain Laboratories in Hamilton, Mont., led the work on the Ebola vaccine.

Kobinger, who had been working on a different Ebola vaccine project at the University of Pennsylvania, had been collaborating with the Winnipeg group. Feldmann told then-scientific director Dr. Frank Plummer he should hire Kobinger.

"So I hired him, and it was one of the smartest things I ever did," Plummer said in an interview with The Canadian Press last year.

Over the past 15 months, Kobinger and 26 other scientists from the Winnipeg lab have worked in rotations in West Africa, with two- or three-person teams operating mobile laboratories to help Ebola treatment centres diagnose those infected with the disease. At one point, Winnipeg had three lab teams in the field. One team is still in Guinea.

Though Canada first developed a mobile testing lab, other countries have followed suit.

At Laval, Kobinger will lead a centre with a strong reputation and a roster of 200 scientists. It does not have a Level 4 laboratory. Those are the most secure laboratories, where work on the most dangerous pathogens is done. But Kobinger doesn't believe the move will spell the end of his Ebola work.

"I see this as expanding the horizons, not restricting them," he said.

"I have so many friends in the field of Level 4 (research) that I'm really hoping that I'll be able to keep collaborating with many of them."

Heinz Feldmann, MD, PhD, Pr. Dr. Chief, Laboratory of Virology

Chief, Disease Modeling and Transmission Section, National Institute of Allergy and Infectious Diseases, USA.

Heinz Feldmann was born in Lippstadt, Germany, in 1959. He graduated from Medical School in 1987 (MD) and received his PhD in 1988 both from the University of Marburg, Germany. His postdoctoral research was conducted in the field of virology (filoviruses and hantaviruses) at the Institute of Virology, University of Marburg, Germany, and the Special Pathogens Branch at the Centers for Disease Control and Prevention in Atlanta, U.S.A, where he held a fellowship from the 'National Research Council'. Following his postdoctoral training he held the position of an assistant and associate professor, with the Institute of Virology at the University of Marburg, Germany. During this time he was trained as an infectious disease specialist with focus on laboratory diagnostics. From 1999-2008, Heinz Feldmann held the position of Chief, Special Pathogens Program of the National Microbiology Laboratory, Public Health Agency of Canada. Since 2008, he is the Chief, Laboratory of Virology at the Rocky Mountain Laboratories (RML), DIR NIAID, NIH, and the Chief Scientist of the RML BSL4 Laboratories. In addition, he is an Associate Professor with the Department of Medical Microbiology, University of Manitoba. Heinz Feldmann is the laboratory expert on high containment viruses (BSL4) and serves as a consultant on viral hemorrhagic fevers and related pathogens for the World Health Organization and, thus, has field experience and expertise in outbreak management. His professional interest is in the pathogenesis and transmission of hemorrhagic fever viruses, such as filoviruses, arenaviruses and bunyaviruses, and other special viral pathogens (high containment, BSL3 and BSL4), and the development of countermeasures against those pathogens. Heinz Feldmann's scientific contribution includes over 330 scientific publications, 6 patents and over 220 invited lectures at conferences and seminars worldwide. Heinz Feldmann was awarded with several honors including the 'Löffler-Frosch Award' from the German Society for Virology (DGV), the 'Dalrymple/Young Award' by the American Committee on Arthropod-Borne Viruses (ACAV), and Research Merit Awards from the Public Health Agency of Canada (PHAC) and the National Institute of Allergy and Infectious Diseases (NIAID).

‘Against all odds’: The inside story of how scientists across three continents produced an Ebola vaccine

Liberia Ebola

Health workers in protective clothing speak with people awaiting medical treatment in the outpatient lounge of Redemption Hospital, formerly an Ebola holding center, in Monrovia, Liberia, in 2015.

JOHN MOORE/GETTY IMAGES

In the spring of 2014, as Ebola exploded across West Africa, a scientist named Gary Kobinger was following the news intently from Canada.

Kobinger was the head of the special pathogens unit at the National Microbiology Laboratory in Winnipeg. He and the team he led had a well-deserved reputation for their work on Ebola and other viral hemorrhagic fevers; Kobinger himself had led development of a promising Ebola therapy.

The Winnipeg lab also had been working for years on an Ebola vaccine, one that looked tremendously effective in animal models. The lab had even produced human-grade vaccine in the hopes of testing it in people. But as of April 2014, that still hadn’t happened. The vaccine had never been deployed in an outbreak. No major pharmaceutical company had expressed interest in developing it.

With Ebola appearing to spread rapidly in a country that had no experience trying to control it — Guinea — Kobinger contacted the World Health Organization to offer the vaccine.

The WHO declined the offer.

“They thought it was premature to advance it,” recalled Kobinger, who said he was told that Guinea lacked the infrastructure to approve use of an experimental vaccine. “That was true,” he added.

The reality was that, for years, scientists who studied Ebola, which belongs to a family of viruses called filoviruses, had poured their hearts into work to develop vaccines and drugs to combat these deadly scourges. And for years, they had seen promising work smash up against unscalable walls. There was no potential for drug makers to recoup development costs; and, with outbreaks only sporadic, there was little opportunity to subject experimental vaccines to rigorous tests.

But faced with the prospect of Ebola victims lying abandoned in the streets of African cities — and the world’s self-interested realization that the virus rampaging through West Africa wasn’t likely to stay there — the balance would eventually tip.

“That big outbreak was a game-changer and reminded people that this exotic virus could become a real threat to public health regionally as well as in a global perspective,” said Dr. Heinz Feldmann, Kobinger’s predecessor, who led the work to develop the vaccine.

Related: An Ebola vaccine was more than two decades in the making. Here are some key people who made it happen

By 2014 Feldmann had long since given up hope that the vaccine — known in the myriad studies he and others published on it as rVSV-ZEBOV — would ever get made. But through an unlikely series of twists and turns, some fortuitous and not-so-fortuitous, the vaccine has finally been developed by Merck, approved by regulatory agencies in the United States and Europe late last year, and used in the field to save lives in Africa. It is known as Ervebo.

It is a feat that built on the work of scientists in multiple countries on three continents who toiled in obscurity for years. And it ensured that when future outbreaks strike, health workers have a crucial new tool at their disposal.

“This vaccine … from the beginning to the end — it should have never happened. On so many levels … against all odds, it made it,” said Kobinger, now director of the Infectious Disease Research Center at Laval University in Quebec.

This is how it happened.

Ebola Inline

The story of the Ebola vaccine began, as scientific advances often do, with a good idea and a lucky break.

In the early 1990s, a Yale University scientist named John “Jack” Rose was trying to figure out a way to use a livestock virus called vesicular stomatitis virus, or VSV, as a vaccine delivery system. While it can infect people, VSV doesn’t sicken them. The immune system response to the virus is rapid and the levels of antibodies induced are surprisingly high.

Rose thought the virus could be an effective backbone for a vaccine — if it could be engineered to include genes of viral pathogens like influenza or HIV. The idea was that the harmless virus would teach the immune system to recognize harmful potential invaders.

But he and students in his lab had been trying for about six years to successfully manipulate VSV to add in the genes of other viruses. One very good student left his lab, he recalled, because she concluded the work was never going to pan out.

Then, in 1994, Rose heard that researchers in Germany had succeeded where he had struggled — with a rabies virus. Using their approach, he was able to recover modified VSV viruses in a few months.

“That opened up a whole new area of research on VSV for us and others,” Rose recalled.

To see if the system worked, his group added a protein from an influenza virus to VSV and injected it into mice. “The neutralizing antibody responses were

To see if the system worked, his group added a protein from an influenza virus to VSV and injected it into mice. "The neutralizing antibody responses were fast and off the charts," he said. "And of course the mice were completely protected after a single dose."

Rose's lab and others later used VSV as a backbone for experimental vaccines for bird flu, measles, SARS, Zika, and other pathogens. It always worked.

Without the high-security laboratories needed to handle the world's most dangerous viruses, the researchers couldn't work on Ebola. Rose, nonetheless, thought a VSV Ebola vaccine, in theory, would work as well.

Yale patented Rose's VSV construct, and licensed it to Wyeth Pharmaceuticals.

By his own estimate, Rose shared his VSV vector with at least 100 labs worldwide. One of them was located in a city in Germany with a rather auspicious name: Marburg.

It was there, in 1967, that laboratory workers and people related to them became sick with what was later named the Marburg virus. The source: primates imported for research purposes. (Nine years later, scientists would discover a related virus, Ebola.)

When a scientist named [**Dr. Hans-Dieter Klenk (born 1938)**] moved to the city in the 1980s to lead the Institute of Virology at the Philipps-University Marburg, there was no research being conducted there on Marburg or Ebola. Klenk decided that ought to change. He asked one of his students, Heinz Feldmann, if he wanted to continue to work on influenza, or move over to filoviruses like Marburg. "He did not think long," Klenk said. "This is how it started."

Dr. John Rose

John "Jack" Rose in his lab at Yale.

COURTESY

With Rose's virus, Klenk's team could study individual Ebola genes by putting them onto the VSV backbone. The beauty of the approach was that they could do the work at lower biocontainment levels than Ebola research is normally conducted, which made it safer, faster, and cheaper.

At first, the protein on the surface of the VSV virus — known as the glycoprotein or G protein — was swapped out and replaced with the Ebola glycoprotein. Later the group made a VSV virus with the G protein of the Marburg virus.

Klenk said that, even then, there was some discussion about whether the hybrid VSV virus could be made into Ebola or Marburg vaccines. But the group didn't have high-containment labs in which to do animal studies, so it couldn't test the theory.

Back across the Atlantic, though, Canada was building a new national microbiology laboratory — one that included biosafety level 4 facilities, the type needed to study Ebola. Feldmann was recruited to lead the special pathogens team there. And when he left Germany in 1999, he asked Klenk if he could take the VSV construct with him, so he could continue his work. Klenk agreed

"This became 'the Canadian vaccine' — how it was known for many years. But certainly it has also roots in Marburg," Klenk said.

As Feldmann recalls it, he wasn't even thinking about using Rose's VSV construct as a vaccine when he was in Marburg. "We had no vaccine program. We had no interest in vaccines," he said. "We used it basically as a model system to study the glycoprotein."

After he'd moved to the Canadian lab, though, Feldmann and Tom Geisbert, a friend and frequent collaborator, heard Dr. Gary Nabel, then head of the National Institutes of Health's Vaccine Research Center, deliver a lecture on Ebola. He argued the glycoprotein was the cause of the profound damage Ebola does when it infects animals and people.

Feldmann and Geisbert, an Ebola expert who was then at the U.S. Army Medical Research Institute of Infectious Diseases, thought Nabel was wrong and that they could use the VSV construct to prove it.

In Winnipeg, Feldmann's team infected mice with the VSV virus containing the Ebola glycoprotein. If Nabel's theory was correct, exposure to the protein should have been toxic to the mice.

The rodents were unharmed.

As an afterthought, the group decided to expose the mice to Ebola to see what would happen. All the mice that had been infected with the VSV virus carrying the glycoprotein were fully protected from illness; the mice that had not been exposed to the VSV virus all died.

"I guess that was basically the start of the vaccine project, even though I don't think we really jumped on it with a lot of priority right away," said Feldmann.

Related: Ebola vaccine approved in Europe in landmark moment in fight against a deadly disease

In hindsight, that delayed response might seem striking. But at the time the Winnipeg group faced more urgent matters. In 2003, an alarming new disease — which came to be called severe acute respiratory syndrome, or SARS — burst out of China and spread to Hong Kong, Vietnam, Singapore, and Toronto. The special pathogens team at the Canadian lab joined the search to try to determine what was causing the new illness and how to contain it. Other work was put on hold.

With the Winnipeg team tied up, Geisbert agreed to replicate the mouse study in nonhuman primates, considered the best animal model for what happens when humans are infected with Ebola.

Like the mice before them, monkeys that had first been exposed to rVSV-ZEBOV survived what should have been a lethal Ebola challenge. A paper on the study was published in Nature Medicine in 2005 — and it "blew the doors off," recalled Geisbert, who is now with the University of Texas Medical Branch in Galveston.

It was suddenly clear that the modified VSV vector, loaded with the Ebola glycoprotein, was not only safe, but that it could be used as the foundation of an effective vaccine.

Scientifically speaking, it was thrilling. But realistically, it was a nonstarter. Vaccines are estimated to cost in the neighborhood of $1 billion to develop. The pharmaceutical industry was not interested in making a product to protect against a disease that emerged only now and again in impoverished countries. At the time, Ebola had killed about 1,300 people over the nearly 30 years since it had been discovered.

"Yes, it was exciting, but where would you go with that excitement?" Feldmann said when asked about the results. "You went to the bar next door and had a beer and continued working."

peer and continued working.

“No one was interested in Ebola.”

In 2008, Feldmann left Winnipeg to become the head of the virology program at the NIH’s Rocky Mountain Laboratories in Hamilton, Mont.

Mobile biocontainment unit Hamburg

Mobile biocontainment unit used to monitor a German researcher who had pierced her finger with a syringe containing Ebola virus during an experiment in 2009.

BERNHARD-NOCHT-INSTITUTE FOR TROPICAL MEDICINE

In March 2009, a sudden crisis led to a critical decision.

A German researcher pricked her finger with a needle containing Ebola virus while doing a mouse experiment. The needle penetrated three layers of gloves; though the wound didn’t draw blood, her skin had been punctured.

The University Medical Center Hamburg, where she was taken, reached out to Ebola researchers in the U.S. and Canada to see if there was anything that could be done.

The experts on the call — a who’s who of Ebola researchers and field workers at the time — concluded that she should be offered the VSV vaccine. Some testing in animals had shown it had increased survival when given after exposure, even as late as 48 hours afterward — though whether that translated into a similar effect in people was unclear.

The Canadian government agreed to send the vaccine — which was not human-grade product, but material the lab had produced for animal studies. Roughly 48 hours after the accident, the woman, who was not publicly identified, was vaccinated.

Trending Now: Comparing the Covid-19 vaccines developed by Pfizer, Moderna, and Johnson & Johnson

The following day, she developed a fever. It’s not uncommon for a live virus vaccine, like rVSV-ZEBOV, to trigger a fever; it’s actually a sign that the immune system has activated. But fever could also have been the first symptom of an Ebola infection. With no way to know which scenario they were facing, the doctors monitoring the researcher transferred her into a specially erected bio-containment treatment unit.

The fever subsided; the woman did not develop overt symptoms of Ebola. It was impossible to know whether the vaccine had shut down a developing infection, or whether she had never been infected in the first place. Feldmann and others believed the latter was more likely.

But, importantly, there were no negative consequences to using the vaccine, a fact that would later give comfort to people who were struggling with whether to deploy rVSV-ZEBOV in a much larger emergency.

Ebola Inline

If two assets hadn’t come researchers’ way, it’s almost a certainty that Ervebo would have never come to fruition. One was money, the other was a rare talent.

The monetary asset was a $2 million grant awarded to the Winnipeg lab. The grant, though a drop in the bucket when it comes to scientific research, was hard-won. Feldmann and Steven Jones, who had done a lot of the animal testing in the lab, had repeatedly applied to U.S. government agencies for funding. Their applications were repeatedly rejected.

In fact, the whole special pathogens program was always in the crosshairs of government bean counters. Every year during the budget process, Frank Plummer, scientific director of the National Microbiology Laboratory from 2000 to 2014, would get pressed on why Canada needed to work on pathogens like Ebola. “I always had to defend it, and we always were scrambling for money,” he said.

The grant was doled out by a Canadian defense program that funded research into tools to combat bioterrorism. It was to be used to produce test lots of human-grade VSV vaccine for Ebola Zaire, the species of the virus that has been the most common cause of Ebola outbreaks.

The idea was to hire a German contract manufacturer, IDT Biologika, to produce the vaccine. First, though, the Winnipeg lab had to create the starter material from which it could do so. That work was laborious and tedious, and it fell to the second asset — Judie Alimonti, an unassuming immunologist and lab scientist dedicated to the cause.

Among other tasks, Alimonti had to develop tests to show that the materials being transferred to IDT did not contain any microorganisms that inadvertently contaminated the product. When IDT had produced vaccine, it shipped back vials to Alimonti who ran the tests to ensure the material was pathogen-free

“Judie did that. … She spent two years on this alone, I think,” said Kobinger. “She put all her heart into it.”

Alimonti, who died of cancer in 2017, loved the project. Her former colleagues describe her as the unsung hero of the Ebola vaccine

She was “a very meticulous, methodical scientist,” said Plummer, who oversaw the VSV vaccine project after Feldmann and then Jones left the Winnipeg lab.

Indeed, if IDT didn’t already have in hand the seed material to make more vaccine, the time needed to develop usable material would simply have been too great when a crisis struck. And the Winnipeg lab’s Ebola vaccine would have missed the chance to attract the big-league help needed to get the vaccine tested and eventually licensed.

“I think probably it would have never happened,” Kobinger said.

After securing a patent for the vaccine system — and obtaining permission from Wyeth Pharmaceuticals to use its platform to produce Ebola and other viral hemorrhagic fever vaccines — the Winnipeg lab talked to a variety of pharma companies, big and small, looking for a development partner. The only interest came from a tiny firm called BioProtection Systems Corp., a spinoff of NewLink Genetics, a biotech working on cancer vaccines.

Gary Kobinger

Heinz Feldmann (left) and Gary Kobinger operating an Ebola testing lab provided by the Public Health Agency of Canada during a 2007 outbreak at Luebo, DRC.

CHRISTOPHER BLACK/WHO

The interest had little to do with Ebola, or even infectious disease vaccine platforms, which is what BioProtection Systems would be licensing. The company was looking for assets to add to its portfolio to generate capital investment, Jones recalled. “It was a business decision for them that it would enhance their portfolio and make it easier to get funding to do the other work they were interested in,” he said.

The deal turned out to be a steal.

NewLink agreed to pay the Canadian government — which officially held the patent — about $156,000 for each product it developed. (An amendment a couple of years later would increase that amount to roughly $360,000.) The Canadian government would also get royalties from some sales, though in truth those royalties were never expected to deliver much.

The company, which would later be absorbed into a drug maker called Lumos Pharma, never pushed development of the Ebola vaccine. For all intents and purposes, it would have remained no more than a scientific idea gathering dust on a shelf.

And then came the West African Ebola crisis.

The outbreak, which probably started in late 2013, smoldered in the way Ebola outbreaks do. At first, the assumption is the people who fall ill have contracted malaria or some other disease. Eventually, health workers become ill. Finally, a diagnosis of Ebola is made.

The WHO reported a “rapidly evolving” Ebola outbreak in southeastern Guinea on March 23, 2014. By that point, there were already 49 cases and 29 deaths, making it larger than about half of all previous known Ebola outbreaks. The following day, the tally grew: 86 cases and 59 deaths.

Before the week was out, cases were reported in Guinea’s capital, the first time Ebola had taken root in an urban setting. By the end of March, one of Guinea’s neighbors, Liberia, was investigating possible cases.

Related: ‘Incredible mind, incredible heart’: After decades fighting Ebola, a beloved expert hangs up his boots

Back in Canada, Kobinger’s offer to the WHO had been rebuffed. He heard that, a few weeks later, GSK, which was developing its own Ebola vaccine, also offered vaccine to the WHO. It, too, was turned down.

Still, Kobinger saw a bright side: “The seed of the [vaccine] being available was planted.”

He mentioned the offer to Dr. Armand Sprecher, an Ebola expert with Doctors Without Borders who he knew as a strong supporter of the VSV vaccine. As Ebola spread from Guinea to Liberia and Sierra Leone, the group, known by the acronym of its French name, MSF, had been emphatically warning the WHO and others that conditions on the ground were rapidly deteriorating. Prompted by Sprecher, MSF started pushing for use of the VSV vaccine.

On Aug. 8, 2014, the WHO declared the outbreak a global health emergency. A couple of days later, the Canadian government announced it would donate its vaccine to the agency.

It was a pivotal moment, but it also created a conundrum. Was the vaccine safe to use? What was an appropriate dose? And how could human trials be conducted in the midst of an epidemic?

Liberia Battles Spreading Ebola Epidemic

People with suspected Ebola virus lie on the ground after arriving by ambulance and just before being admitted to the Doctors Without Borders Ebola treatment center near Monrovia, Liberia, in August 2014.

JOHN MOORE/GETTY IMAGES

It is widely considered to be unethical to use untested drugs or vaccines in Africa, where clinical safeguards are sometimes lacking and where memories linger of scandals like Pfizer’s use of a meningitis drug that resulted in the death of 11 children in 1996. Yet given the scale of the expanding crisis, experts were now scouring the medical literature, looking for any existing medicines that could be repurposed to fight Ebola, or experimental vaccines or drugs, regardless of where they were in the developmental pipeline.

The WHO convened a meeting to determine the best path forward. It concluded there was an “ethical imperative” to try experimental vaccines and therapies, given the extraordinary threat Ebola presented. But it was also decided that in order to use the donated Canadian vaccine, clinical trials first had to assess its safety and establish the appropriate dose. It was apparent to everyone that NewLink didn’t have the expertise or bandwidth to take on this work.

Marie-Paule Kieny, who then headed the division of the WHO tasked with trying to spur development of drugs and vaccines for diseases like Ebola, noted the company had never conducted a clinical trial. “So when we were saying, ‘We should do a clinical trial in Africa,’ they were completely lost,” Kieny recalled.

Researchers at the NIH and Walter Reed Army Institute of Research (WRAIR) started planning a Phase 1 trial to determine the appropriate dose of the vaccine. Others started working on Phase 1 trials that would be conducted in Switzerland, Germany, Gabon, and Kenya.

The WHO and others — including players in the U.S. government — began casting about to find a more experienced pharmaceutical company to partner with, or to acquire the vaccine from NewLink.

The list of potential white knights wasn’t long. Sanofi Pasteur wasn’t interested. Novartis had sold its vaccines division to GSK earlier that year. GSK was racing to test its own experimental Ebola vaccine. Johnson & Johnson’s vaccines division, Janssen, was also working on an Ebola vaccine, but it wasn’t as far along as the GSK or the NewLink vaccines. But Merck had experience producing vaccines in the types of cells the VSV vaccine was made in.

Related: FDA approves an Ebola vaccine, long in development, for the first time

The company started fielding approaches from the WHO, the Biomedical Advanced Research and Development Authority (BARDA), and others asking if Merck would step up. Merck had already been debating what it could do to help with the outbreak, and the vaccine seemed like a good fit

“We already understood how to scale production of vectors in that system, and we knew how to manage the whole scaling process. We had an enormous amount of know-how that was kind of complementary to the work that had already been done,” said Dr. Julie Gerberding, Merck’s executive vice president and chief patient officer for strategic communications, global public policy, and population health.

Gerberding said there was “moral clarity” at Merck that this was something the company should do

Gerberding said there was "moral clarity" at Merck that this was something the company should do.

In the anxious autumn of 2014, when Ebola was ravaging West Africa, it seemed like rumored negotiations between NewLink and Merck were taking forever. But in terms of a pharmaceutical deal, negotiations happened at warp speed.

"[From] Merck deciding to get involved from the initial sort of exploratory discussions at the beginning of October to licensing the vaccine in mid-November, that is unprecedented in terms of internal decision-making within the company because people recognized how urgent it was," said Dr. Mark Feinberg, the company's chief science officer at the time.

Merck agreed to pay NewLink $50 million for the license. The deal was announced Nov. 24, 2014.

rVSV ZEBOV Ebola vaccine

rVSV ZEBOV Ebola vaccine

WRAIR

That same month, around the time the researchers at NIH and WRAIR arrived at an agreement about the appropriate dose for the vaccine, Kobinger made a heart-stopping discovery. It was about the vaccine being used in the trials, donated by the Canadian government.

From its earliest iteration, when Feldmann and his team saw that it saved mice from Ebola, the vaccine had been made with the glycoprotein from the Ebola Zaire strain known as Mayinga. But somewhere along the line, a key feature in the vaccine had been changed.

The human-grade vaccine made by the German contractor contained the glycoprotein from a different Ebola Zaire strain.

No one had told Kobinger the change had been made; he discovered that Alimonti, who had done all the work to prepare the materials for IDT Biologika, had used the different glycoprotein on instructions from one of her supervisors. No one outside the lab realized that the vaccine being tested in people was not identical to the one that had been studied so thoroughly in animals.

Feldmann believed the switch would have no impact on whether the vaccine was effective. "Quite frankly, from a scientific prospective, it doesn't matter," agreed Kobinger. "From a regulatory perspective, it matters a lot."

Kobinger quickly fired off an email to the Food and Drug Administration to inform the agency of his discovery.

He feared fireworks. That's not what he got. "We never heard back," he said, noting the fact that Phase 1 human trials were already underway may have helped.

Still, Kobinger urgently shipped off some doses to Montana so Feldmann could test the vaccine in primates to ensure the change had not affected the vaccine's efficacy. It had not.

Merck map Ebola

COURTESY MERCK

As researchers who conducted the Phase 1 and Phase 2 trials crunched their data, others were planning pivotal Phase 3s. The earlier trials were to determine if the vaccine was safe to administer; the Phase 3s would tell the world if it actually worked.

The NIH had reached an agreement with Liberia to test both the GSK vaccine and the VSV vaccine that Merck had acquired. Scientists from the Centers for Disease Control and Prevention were to test the vaccines in Sierra Leone.

The government in Guinea was also keen to host a trial. But the country's health infrastructure was weaker than those of its neighbors, making it a more challenging place in which to conduct a study. When no other group stepped forward, the WHO announced it would conduct a trial there, with help from MSF.

The plan was to use an approach known as ring vaccination. People who had had direct contact with anyone infected with Ebola were to be vaccinated, as were their contacts. The goal would be to both protect people in the virus's path and to block it from spreading.

In place of a placebo control, the rings were randomly assigned to either immediate vaccination, or vaccination after a 21-day delay. If there were more cases among the people in the rings that were vaccinated after the delay, the vaccine was working.

The approach was distinct from the one used in classical trials, in which participants are randomly selected to get either an intervention or a placebo, with neither the researchers nor the participants aware of which was administered.

To proponents, ring vaccination, a type of adaptive trial design, was the most feasible approach. Not everyone would agree.

WHO Ebola meeting 2014

WHO Assistant Director-General Marie-Paule Kieny (left); professor Oyewale Tomori from Redeemer's University in Nigeria; and Samba Sow, director-general of the Center for Vaccine Development in Mali, discuss the outcome of a WHO-led expert meeting on fast-tracking experimental Ebola vaccines and drugs in September 2014.

Guinean health professionals made up the bulk of the team that conducted the ring vaccination trial

Dr. Abdourahmane Diallo, a public health physician who works for Guinea's health ministry, was one of those who answered the WHO's appeal for help. He recalled that his colleagues were excited at the prospect of taking part in the study. "The only thing in our mind was that we wanted to assess if the vaccine worked or not because we wanted to contribute if possible to find a solution," Diallo told STAT via email

There were hints that it was working, he remembered. Others agreed. Neighborhoods where transmission had been intractable stopped producing cases after vaccination occurred. "But that's not proof, of course," said Kieny of the WHO. "That's just a feeling."

In June, however, the trial's data and safety monitoring board concluded there were not likely to be enough additional cases to change the outcome of the study. The vaccine had worked.

From 10 days after vaccination — the time needed for the immune system to respond to the vaccine — there were no cases among people who had been

vaccinated in the early rings, but there were cases among the delayed vaccination rings.

The data and safety monitoring board recommended that health workers vaccinate anyone who had come in contact with people infected with Ebola as quickly as they could be found, rather than delaying some vaccinations.

On July 31, 2015, less than a year after the Canadian government donated the vaccine, the findings of the trial were published by the journal The Lancet. In less than 12 months, 12 clinical trials running the gamut from a "first in man" dosing study to a Phase 3 efficacy trial had been conducted. "That has never happened," said Feinberg, who is now CEO of the International AIDS Vaccine Initiative.

In an editorial, The Lancet called the trial "a remarkable scientific and logistical achievement."

"That such a trial was even possible is a testament not only to the skill of the research teams but also to the commitment of communities to defeating an epidemic that has devastated their nation," the journal's editors wrote. "Before this work, no clinical trial on this scale had ever been performed in the country."

The Guinea vaccine trial — the trial that almost hadn't happened — was the only one to reach a conclusion. The trials in Sierra Leone and Liberia ended without having enrolled enough patients to do so

JEROME DELAY/AP

Despite the success, the study produced a backlash that was almost instantaneous in some quarters.

While everyone wanted an effective Ebola vaccine, there was heated debate over whether adaptive design studies were sufficient to prove that the Merck vaccine met that threshold. The detractors were vocal.

"It was ugly, frankly. It was ugly," Kieny said. "I thought everybody would be happy to say: 'This is great.' But actually, this is when the bashing started. 'This is not a study.' … 'Only a randomized controlled trial.' The campaign against these results was flabbergasting."

Both the findings and the approach were critiqued — and to this day are challenged by some experts. In the spring of 2017, the National Academy of Sciences issued a report on conducting research during disease outbreaks that called into question the way the trial was conducted and its findings.

"We concur that, taken together, the results suggest that the vaccine most likely provides some protection to recipients — possibly 'substantial protection,' as stated in the preliminary report," the authors wrote. "However, we remain uncertain about the magnitude of its efficacy, which could in reality be quite low or even zero, as the confidence limits around the unbiased estimate include zero."

In the trial, the vaccine had been found to be 100% effective. But the number of people enrolled was limited, and no vaccine works every single time. Still, the results were strong enough to convince Merck to push forward with the vaccine.

It did so with support from BARDA, which began funding rVSV-ZEBOV during the West African outbreak. The agency's director, Rick Bright, estimated that it has spent about $175 million supporting production of vaccine and validation of Merck's production facility for the vaccine in Germany.

When Ebola broke out in Equateur province in the Democratic Republic of the Congo in the spring of 2018, the country agreed to use the vaccine under a "compassionate use" protocol — similar to the protocol used in a clinical trial when there is no approved therapy. Vaccination began again in the country in the current outbreak, this time eight days after it was declared. Since then more than 260,000 people have been vaccinated.

"I'm really proud of that," Rose said of the role played by the vaccine. "We worked night and day … trying to get VSV to work and finally got it to work."

On Nov. 11, 2019, Ervebo was approved by the European Commission, the first time it had been licensed by any regulatory agency. On Dec. 21, the FDA approved the vaccine in the United States.

Beth-Ann Coller, who has been the project lead at Merck — another unsung hero of the vaccine, said Kobinger — choked up a little describing her reaction to the approval of the vaccine. "We are thrilled and we are proud," she said.

Kieny waxed a bit philosophical about the unlikely success of rVSV-ZEBOV.

"You know, when things go really wrong, quite often it's a succession of little issues in which none by themselves could have derailed the train. And sometimes for something good to happen it's the same," she said. "It's just bringing together a number of discrete actions and discrete facts, which each alone would not have made it. But everything together makes it a success."

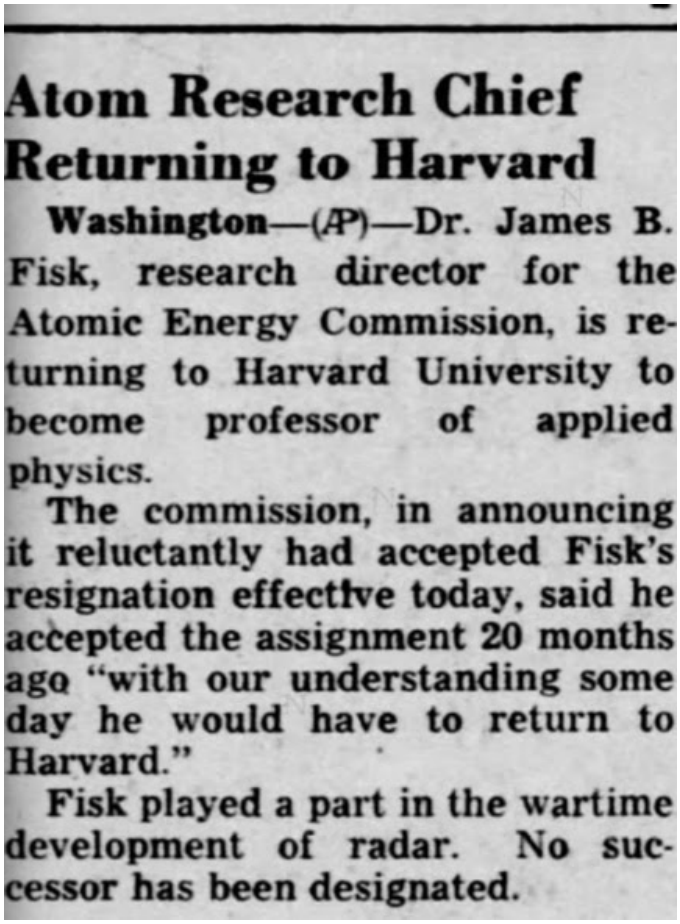
Dr James Brown Fisk



Atom Research Chief Returning to Harvard

Washington—(AP)—Dr. James B. Fisk, research director for the Atomic Energy Commission, is returning to Harvard University to become professor of applied physics.

The commission, in announcing it reluctantly had accepted Fisk's resignation effective today, said he accepted the assignment 20 months ago "with our understanding some day he would have to return to Harvard."

Fisk played a part in the wartime development of radar. No successor has been designated.

"Late 1960s" - Made a pioneering seed collection trip to Mexico in the late 1960s to secure additional pine genetic material for South Africa

See 2010 report from **Camcore** : [HI0006][GDrive]

"Hennie Coetzee, a leader in promoting plantation forestry in South Africa and long standing friend of Camcore, died suddenly during a consulting visit when in the Sabie region in mid-2010. Hennie had a long career with government forestry organization in the country. With ***Rodney Fisk*** *and Neville Denison, he made a pioneering seed collection trip to Mexico in the late 1960s to secure additional pine genetic material for South Africa. Hennie served as Camcore representative for SAFRI (South African Forestry Research Institute) for several years during the early 1980s and always exhibited a contagious enthusiasm for the Camcore effort. He urged Camcore to expand its seed collection work in Mexico for the benefit of southern Africa; work that was eventually completed by the year 2000. Hennie will most be remembered by his friends for his wonderful sense of humor. In many ways, he was "one of a kind" and will be greatly missed by all those who knew him"*

From a note in passing ([HC000C][GDrive]) , we read "***Mr. Fisk obtained academic qualifications in the natural sciences, which have enabled him to interact with environmental groups*** *from a practical and theoretical perspective, based upon extensive conservation experience.*"

1982 (September) - While in Washington DC, visited by South Africans Jan Smith (and wife Esme)

See book : [HB001T][GDrive]

*In **September 1982** while on the way to the W.E.C. in Saville, we stopped over in Washington for four days. While Jan was engaged in talks at the S.A. Embassy, I toured the Kennedy Centre for Performing Arts and by tour mobile visited the Lincoln memorial, Arlington Cemetery, the Smithsonian, the National Art Gallery, the Capitol, the Library of Congress, and the White House. That evening we had dinner at **Rod Fisk's (of the S.A. Embassy) home in Maryland**. Next day I again enjoyed art exhibitions and the Museum of National History. The S.A. ambassador Brandt Fourie and his wife Daphne invited us to dinner the night before we flew to Paris. Beautiful dried bougainvilla arrangement on the dinner table.*

1983 (August) - Again visited by South Africans Jan Smith (and wife Esme)

See book : [HB001T][GDrive]

*On the 31st of August we flew to Washington and had a lovely surprise to be met at the airport by Andre and Heila. During the next few days I accompanied Andre and Heila in their Dodge camper to the various memorials, museums and sights while Jan was busy with nuclear matters. On the Saturday afternoon the **Fisk family** took Joan and Grant Park, Andre, Heila, Jan and I to a fun supper of fresh crabs in Annapolis, 40 Miles away from Chesapeake Bay.*

- Esme (du Preez) - 30 April 1922
- Keetmanshoop South West Africa
- married to Jan ("Jannie") Hendrik Smith (https://www.geni.com/people/Jannie-Smith/6000000009822053260) (June 06 1923 to Oct 04 2006)
- Germiston, East Rand, Gauteng, South Africa

WHo was "Jan Smith" ?

From 2006 book ***"Uranium Road: Questioning South Africa's Nuclear Direction"*** .. it would appear that as of 1984, **Jan Smith** was the chairman of ESCOM .

What is ESCOM ?

"The utility is the largest producer of electricity in Africa" See Wikipedia : https://en.wikipedia.org/wiki/Eskom . "**Eskom** is a South African electricity public utility, established in 1923 as the **Electricity Supply Commission (ESCOM)** and also known by its Afrikaans name **Elektrisiteitsvoorsieningskommissie (EVKOM),** by the government of the Union of South Africa in terms of the Electricity Act (1922). Eskom represents South Africa in the Southern African Power Pool."

In the 1970s, "Jan Smith" was the CEO of ESCOM. THis means that in 1982 and 1983, "Rodney Fisk" was in Washington DC as a diplomat representing South Africa, meeting with the CEO / ex-CEO of ESCOM ("Jan Smith"), to discuss "nuclear matters"

See December 14 2014 issue of the "Sunday Times"

Thirty years of mistakes at Eskom

Once, supply outstripped demand

Sunday Times 14 Dec 2014 Terry Mackenzie-Hoy Mackenzie-Hoy is a consulting engineer in private practice

GO SLOW: Construction on Eskom's Medupi power station started in 2007. Eighteen months behind schedule, it will produce its first power next year

IN the last days of 1979, a fault occurred at an Electricity Supply Commission (now Eskom) power station. A local substation circuit breaker tripped. Due to a miscalculation, however, the circuit breaker was not set correctly and further circuit breakers tripped.

In turn, these caused further trips until 76 circuit breakers had tripped, interrupting the flow of current in many of Eskom's main power lines.

Thirty-five minutes after the initial fault, the only power station still connected to the grid was Wilge, the main power supply for Iscor. But Iscor's steelworks had tripped due to underfrequency. With the steel freezing in the furnaces, Iscor reclosed the circuit breakers onto the Eskom grid. Overloaded, Wilge shut down.

Apart from some municipal power stations, the whole Eskom system was down. Lacking remote control facilities and communicating via landlines, Eskom staff worked over the next 36 hours to restore power.

A failure of this magnitude had never occurred. During the 1970s, then-Eskom CEO Jan Smith and Eskom planners calculated that generating capacity had to double every 10 years. Besides Lethabo and Tutuka power stations, which were already under construction, new facilities Matimba, Kendal and Majuba were brought into the mix. Other construction included four more power stations, a nuclear power station and a pumped storage scheme. The construction had to be financed by raising electricity tariffs, in 1976 (twice), 1977 and again in 1981.

Eskom was deeply unpopular, but its engineers had little time for politics. The government was pushed to act. The De Villiers commission was set up to investigate, the net outcome of which was to retire Smith in 1985. Ian McRae replaced him.

At this time a seemingly small event occurred. In 1986, a new department was formed: marketing.

The year before, Eskom had revised down its demand projections and realised that it was building more generation capacity than seemed required. Some of the construction could be deferred. In 1987, Eskom announced that it would continue with construction and mothball or shut down older, less efficient power stations. By 1991 Inhambane, Camden, Grootvlei and Komati, and two others, a total of 5 000 megawatts, had been mothballed. Nobody in 1985 foresaw the new South Africa.

Future demand looked set to grow slowly. In 1990, there was widespread unrest. The reserve margin of demand over available capacity soared to 38%. The prudent approach would have been to sit it out until the demand rose. But then the marketing people went to work.

They offered municipalities cut-price rates, provided municipalities shut down their own power stations. Oil refineries were incentivised to use electrical motors and "off-peak" tariffs were offered to people who could use power out of normal working hours. Farmers, who had for years used diesel generators, signed up to become connected to the grid.

The marketing department was not quite done. It noted that there was an aluminium smelter in Richards Bay, the Bayside smelter. Could one make another smelter, bigger, which would suck up power from Eskom? A consortium created the Hillside aluminium smelter that would use about 1 000MW of power.

By 1998, Eskom had shed 3 850MW by closing power stations and had committed itself to supply 1 000MW for Hillside and a further 1 000MW for Mozal. That's 5 850MW. Majuba was coming online, but its 3 843MW was still about 2 000MW short of what Eskom had shut down or committed to. Still the marketing department was not finished. It persuaded in- dustrial steam consumers — SAB and paper mills — to shut down coal boilers and install electrode boilers. The incentive was dirt-cheap power.

So despite Cahora Bassa power with 1 900MW due to come online, and plans for a pump storage scheme at Braamhoek (four times 333MW), with the prospect of demothballing Camden, Komati and Grootvlei power stations, Eskom still needed new power stations.

Even a white paper presented to the cabinet in 1998 did not prompt the government to institute new generation projects. A group of engineers wrote to Eskom and asked what the utility would do for power in 2007, when supply ran out. The letter was never acknowledged.

It was clear Eskom would run out of power in 2007. Nobody in the elec- trical engineering fraternity thought that Eskom or the government would wait until the system crashed. But in 2005 blackouts began.

Eskom quickly announced the construction of new power stations Medupi, which began in 2007, and Kusile. The ANC owned 25% of the chosen boiler supplier, Hitachi. Welding on the boilers failed tests. The boiler software failed acceptance tests and the construction fell behind. Finally, boiler construction and software were subcontracted. Eighteen months behind schedule, Medupi will produce its first power in a few months; it will take three years to reach capacity of 4 800MW.

Renewable energy projects set up by the government now provide about 3 922MW. But no renewable scheme can operate 24 hours, so it has a limited effect. For peak demand, two gas turbine stations were installed in 2008, which consume very high levels of gasified diesel.

The future power supply can be solved by coal or nuclear power stations coupled with hydro pump stor-

> Power supply can be solved by coal or nuclear power stations

Age schemes. There are coal reserves of 53 billion tons, enough for 200 years of consumption at present rates. The existing open-cycle gas turbines should be supplemented with gas turbines burning heavy fuel oil, of which there is abundant supply. Coal supply mines should be responsible for delivery to ensure that the coal is actually delivered and on time. Gas imports from Mozambique should be accelerated.

In the immediate short term, a system such as that used in France in the '80s should be instituted: consumers choose the option of being load-shed at any time in exchange for a reduced tariff and any consumer who can generate into the grid should be encouraged to do so.

It is hard to predict if, Eskom-wise, this is the end, the beginning of the end or the end of a new beginning. Eskom has made all the mistakes it could possibly make in the past 30 years. There is no reason to continue to make more.

US to ship bomb-grade uranium to Romania

1989-12-11-the-guardian-pg-20

Alan George

THE US is planning to ship bomb-grade uranium to Romania despite fears that it may be working on a nuclear weapons programme.

The shipment of 16.48 kilograms of 93 per cent enriched uranium is destined for a 14-megawatt research reactor at Potesti, which was supplied by the California-based General Atomics company in the 1970s. The material, manufactured by General Atomics about 10 years ago, has been in storage with the Department of Energy (DOE).

The US provided 38.7 kilograms of enriched uranium for Potesti in 1978. This is now spent and the new consignment is needed to keep the reactor running. Romania's State Committee for Nuclear Energy approached the DOE and the US Nuclear Regulatory Commission (NRC) for the new supplies early last year. An export licence was issued in August last year, and this has now been extended until August 31, 1990.

Washington's nuclear collaboration with Romania dates from the 1970s, when the West was vigorously encouraging President Nicolae Ceausescu to pursue policies independent of the Soviet Union.

At the same time, Britain concluded a series of major contracts with Bucharest, including a deal for the supply of Rolls Royce engines for a locally-produced fighter aircraft.

Although Romania is a signatory to the Nuclear Non-Proliferation Treaty, Mr Ceausescu boasted earlier this year that his country had the capacity to produce nuclear weapons. Last summer, Romania reportedly warned neighbouring Hungary it was working on nuclear weapons and a ballistic missile system.

Engineers on Iraq's Condor-2 ballistic missile programme claim to have worked on a similar project in Romania.

Whatever Romania's military aspirations, Bucharest certainly has a record of carelessness with nuclear materials. In 1986, Norway supplied Romania with 12.5 tons of heavy water, on the strict understanding that it would not be re-sold. But Romania transferred the water either to Israel or India, prompting a formal protest from Oslo in May last year.

The US uranium shipment is being arranged by a Washington-based nuclear fuel management company, Edlow Inc. Its International Vice-President, Mr Rod Fisk, asked whether the company was concerned over how the uranium might be used, said: "That's a question you have to address to the US Government."

tended consequences of international isolation; the lessons of Pretoria's nuclear program for would-be proliferators; the influence of U.S. diplomacy; and the usefulness of nuclear weapons.

South Africa's international isolation influenced every element of its nuclear program. This ostracism intensified the government's laager mentality, which played a large part in the initial decision to develop nuclear weapons. At the same time, this isolation reinforced senior officials' parochial worldview, which inevitably influenced nuclear decision making. Few leaders had traveled extensively outside of the country and fewer still beyond southern Africa to Europe or the United States. The bureaucracy shared and reinforced these views. The Foreign Ministry, which might have been expected to add a more cosmopolitan understanding to government decisions, was not consulted on the decision to either initiate or terminate the nuclear weapons program.

This air of unreality was demonstrated most noticeably by the country's nuclear strategy, which was less a rigorous strategy than wishful thinking. As one senior government official remarked, "It now seems like building castles in the air to think that the nuclear strategy would have worked as planned."[109]

This strategy reflected a seat-of-the-pants approach to security issues, an approach that ultimately rested on assumptions that went not only unchallenged but wholly unexamined. The ostensible security rationale for the nuclear weapons program was the threat of "total onslaught" confronting the country in the mid-1970s. Yet the former chief of South African military intelligence during this period, General H. D. E. V. du Toit, discounted this danger: "I don't think we ever thought it was feasible for anyone to attack us from the north." As for the Soviet threat, he said, "The Communist bogey was set up at every stage—but we had no one in the military who read, spoke, or studied Russian." It was "silly to set the Soviets up as the force behind the total onslaught."[110] The Foreign Ministry also lacked any Soviet expertise. Further, as part of the peculiar ad hoc decision-making process that seemed the norm rather than the exception in the South African government, communication and policy coordination among government departments and ministries were sporadic at best.[111] Until 1985, the military did not even have a policy planning staff.

The success of South Africa's nuclear strategy depended on Pretoria's ability to manipulate Washington's behavior—to compel the United States to intervene politically or militarily on Pretoria's behalf. Yet relations were so strained between the two countries that it is impossible to believe that any American administration would have

[115]De Villiers and Stumpf joint interview. Of course, it could also have turned out to be seven, which was the number of devices Pretoria had originally selected for its nuclear stockpile but did not have time to manufacture.

[116]The nuclear programs of these three countries are examined in Reiss and Litwak, *Nuclear Proliferation after the Cold War*, in the chapters by Brahma Chellaney (India), Ali T. Sheikh (Pakistan), and Shai Feldman (Israel).

[117]South African officials have claimed that a benefit of nuclear weapons was their cost-effectiveness when compared with the high price of conventional weapons, such as jet fighter aircraft. This argument is far-fetched, since there was no real trade-off. Pretoria could not have acquired modern combat aircraft on the international arms market and could not have itself developed this technology. Moreover, nuclear weapons are traditionally complements to, and not substitutes for, conventional weapons, so it is likely that the nuclear arsenal would have been an *added* defense expenditure if Pretoria could have purchased or acquired jet fighters. On the debit side of the ledger, the nuclear weapons program siphoned off many of the country's most talented scientists and engineers. The loss to South Africa's industrial productivity must be recognized when toting up the benefits and liabilities of the nuclear weapons program.

The U.S. Uranium Industry: Regulatory and Policy Impediments

Thomas E. Drennen and Jessica Glicken
Energy Policy and Planning Department
Sandia National Laboratories
Albuquerque, NM 87185

Acknowledgments

The authors would like to thank several individuals for their assistance with this project. Melissa Mann and Rod Fisk of Edlow International provided necessary background research for several sections of the report. Nancy Hetrick of Tech Reps, Inc., assisted the authors in editing and formatting the manuscript. Vicki Bruch and Linda Branstetter, both employees of Sandia National Laboratories, reviewed the document and provided useful feedback.

Abstract

The Energy Policy Act of 1992 required the U.S. Department of Energy to develop recommendations and implement government programs to assist the domestic uranium industry in increasing export opportunities. In 1993, as part of that effort, the Office of Nuclear Energy identified several key factors that could (or have) significantly impact(ed) export opportunities for domestic uranium. This report addresses one of these factors: regulatory and policy impediments to the flow of uranium products between the U.S. and other countries. It speaks primarily to the uranium market for civil nuclear power. Changes in the world political and economic order have changed U.S. national security requirements, and the U.S. uranium industry has found itself without the protected market it once enjoyed. An unlevel playing field for U.S. uranium producers has resulted from a combination of geology, history, and a general U.S. political philosophy of nonintervention that precludes the type of industrial policy practiced in other uranium-exporting countries. The U.S. has also been hampered in its efforts to support the domestic uranium-producing industry by its own commitment to free and open global markets and by international agreements such as GATT and NAFTA. Several U.S. policies, including the imposition of NRC fees and licensing costs and Harbor Maintenance fees, directly harm the competitiveness of the domestic uranium industry. Finally, requirements under U.S. law, such as those in the 1979 Nuclear Nonproliferation Act, place very strict limits on the use of U.S.-origin uranium, limitations not imposed by other uranium-producing countries. Export promotion and coordination are two areas in which the U.S. can help the domestic uranium industry without violating existing trade agreements or other legal or policy constraints.

1999 - 2000 - Rod Fisk joins Transport Logistics Inc (TLI), a company that was formed in 1998

See note from Daher-TLI : [HC000C][GDrive]

It is with great sadness that we report the death of ***Mr. Rodney H. Fisk****, former president and CEO of Transport Logistics International.* ***Mr. Fisk joined TLI shortly after it's founding in 1998, and served as CEO until his retirement in late 2009.***

2001 (August) - Rod Fisk (of TLI) comments on US nuclear watchdog has refused to approve containers made by the Nuclear Energy Corporation of SA for transporting hazardous material

See the Aug 2000 Radbull (Radiation Bulletin) : [HP0021][GDrive]

Setback for Nuclear Industry

allAfrica.com: Business Day (Johannesburg)

August 10, 2001

Simon Barber - Washington

US watchdog rejects application that is ridden with inconsistencies

In a major embarrassment and a potential threat to SA's effort to sell revolutionary nuclear technology to the world, the US nuclear watchdog has refused to approve containers made by the Nuclear Energy Corporation of SA for transporting hazardous material.

The rejection by the US Nuclear Regulatory Commission, which one industry source called "spectacular", is a potentially grave embarrassment for SA's otherwise highly regarded nuclear regulator, which licensed the containers for domestic use in 1999.

Observers said SA could ill afford the erosion of the credibility of its nuclear regulator as it would play a key role in vouching for the safety of the revolutionary pebble bed modular reactor that Eskom is developing for export with US and British partners.

The corporation also stands to forfeit much of its investment in the containers unless its differences with regulators are settled.

The containers heavily shielded seven-ton units, technically known as ZA/CNS1006 packages are designed for carrying Cobalt-60 "pencils" whose applications include cancer treatment and the sterilisation of food and medical products.

SA's National Nuclear Regulator rated the package, one of the largest of its kind and a potentially significant source of export revenue, as robust enough to transport pencils producing up to 340000 curies of radiation. But in a May 25 letter to the US transportation department, William Brach of the US commission said the commission would not "validate" SA's approval of the package for use in the US.

This was because the application the SA licence and the design and test data on the basis of which it was granted was ridden with "inconsistencies".

"The package does not appear to have been fabricated in compliance with the drawings submitted . The testing descriptions and results are incomplete or missing, and do not appear to comply with the (International Atomic Energy Agency's) safety criteria," he wrote.

***Rod Fisk**, **CE of Transport Logistics International**, a Washington-based nuclear materials shipping firm, said such rejections were almost unheard of.*

Responding to questions from Business Day, the SA corporation initially denied any connection with the application.

The company said it had supplied the containers to an organisation, which it declined to identify, "involved in the supply of Cobalt-60 pencil sources to the gamma irradiation industry. Under the terms (of the contract), the responsibility

for licensing the container in countries other than SA is that of the customer or end user."

It has been established the customer was Reviss, a UK-based company that markets Cobalt-60, and other radionuclides produced in Russian power reactors, to the US and elsewhere.

David Rogers, the Reviss official who handled the licence application, denied his firm was to blame for the rejection. "As far as the paperwork goes, we acted as little more than the postman. We presented the (corporation's) safety case to (the US authorities) with a covering letter."

The corporation said Nuclear Technology Products, a division of the corporation's commercial group, Pelindaba Technology, began making containers "out of the strategic necessity to control the distribution of radioactive products it produces at Pelindaba and which are exported widely".

"There is a growing export market, and transport containers capable of carrying large quantities of Cobalt-60 are essential."

The corporation declined to provide figures, saying only that the containers were a "small but significant part of Nuclear Technology Products' portfolio".

If its customer did not have alternative containers for shipments, "the financial and business credibility implications would be grave. Reliable and timeous supplies are watchwords in the radio-isotope business."

2003 (July) - News article in Baltimore Sun

Full Page : [HN00LM][GDrive]

ALGERINA PERNA : SUN STAFF PHOT

A worker at Rukert Terminals guides empty cylinders used to transport natural uranium hexaflouride during unloading from the TLI Aquila. The ship's two 80-ton cranes lifted the containers out of the hold and onto trucks

NUCLEAR FUEL AT SEA

Daily radiation readings and security drills are routine aboard the TLI Aquila, a ship that carries uranium from country to country.

By PAUL ADAMS
SUN STAFF

STANDING on the bridge of the *TLI Aquila*, Capt. Adelbert Hansen reaches into his faded shirt pocket and pulls out a small dosimeter, a pen-light-shaped device every crew member carries to monitor their exposure to radiation from the ship's uranium-laden cargo.

Pointed toward the Baltimore skyline, the device gives a reading of less than one microsievert — a standard unit of measure that represents a tiny fraction of the level considered safe by government standards.

"See, I don't worry," Hansen said, referring to the 48-inch diameter cylinders filled with uranium that the ship specializes in transporting. "I like this ship. It's a little ship, but it's fast. It's fast."

Daily dosimeter readings are just one of the standard precautions taken aboard the 330-foot *Aquila*, a blue-hulled freighter that crisscrosses the Atlantic, taking multimillion-dollar shipments of uranium from one refining facility to another before it is finally ready to be consumed as fuel in a nuclear power plant. With its proximity to nuclear customers in the Midwest, Baltimore is a regular port of call.

The daily attention to safety aboard the *Aquila* is a reminder that the ship's cargo is not ordinary. Regulations govern everything from crew selection to how the cargo is packaged and loaded to ensure against a nuclear accident. And with the world on high alert for terrorists, security around hazardous cargo is a top priority.

TLI AQUILA

The freighter, which docks at Baltimore (above) and hauls uranium across the Atlantic, features a double-lined hull and redundant electrical and fire-suppression systems. Other details:

Length	330 feet	Crew complement	13, mostly Russian
Cruising speed	15 knots	Special equipment	Six radiation detectors, hazardous materials suits
Carrying capacity	4,700 metric tons		
Cargo space	6,800 cubic meters		

"Because we're talking about inherently dangerous materials, it is probably the most highly regulated form of transportation in the world," said Lorne Green, secretary general of the World Nuclear Transport Institute, an industry trade group based in London. "It's like playing the piano — it looks easy until you try it yourself."

The ship's Maryland operator, Transportation Logistics International, is one of a handful of companies in the world that specialize in the politically charged, bureaucratic work of trans- [*See Uranium, 4D*]

[HN00LN][GDrive]

"Because we're talking about inherently dangerous materials, it is probably the most highly regulated form of transportation in the world. It's like playing the piano — it looks easy until you try it yourself."

Nuclear fuel a dangerous cargo at sea

[*Uranium, from Page 1D*]

porting radioactive material.

"It's a job that takes many years of both formal and informal on-the-job training," said Rodney H. Fisk, Transportation Logistics' chief executive and a former South African diplomat. "For most people, once you get into this field, you stay in it. It's not a transitory job at all."

A self-described conservative businessman with an accent that reflects his Cape Town roots, Fisk's job is to communicate with regulators and Cabinet-level officials in overseas governments. That task has taken on added urgency as the International Atomic Energy Agency, International Maritime Organization and various government agencies here and abroad study ways to improve the security of hazardous cargo in the wake of the Sept. 11, 2001, attacks.

Those moves dovetail with the Department of Homeland Security's efforts to improve security at U.S. seaports. Coast Guard and Customs officials have stepped up inspections of ships and cargo, and ports have spent millions installing new surveillance systems, fencing and other security measures.

Though the uranium Transportation Logistics transports is

SUN STAFF

Montgomery County and a small number of agents in offices overseas. Its five founding partners own 60 percent of the company, while the other 40 percent is held by a German affiliate, Nuclear Cargo Service. Customers include uranium mines, refining facilities and power plants.

The company doesn't disclose its revenue, but industry experts said nuclear transportation is a niche that commands premium rates because of the high value of the cargo and the expertise involved.

"It's not a big market, so there aren't a whole lot of players," said Felix Killar, director of fuel supply and material licensees for the Nuclear Energy Institute. "But [Transportation Logistics] is one of the players."

ALGERINA PERNA : SUN STAFF PHOTOS

Mark T. Lambert, president of Transportation Logistics International's shipping subsidiary, and Melissa Colvin Mann, a partner in Transportation Logistics, visit the bridge of the TLI Aquila while the uranium-hauling ship is docked at Rukert Terminals in Canton.

The nuclear marketplace

Uranium moves across borders and oceans before it is ready to be used in nuclear power plants. A look at countries that use nuclear power and where uranium is processed across the globe.

Electricity generated by nuclear energy

ber's cumulative dose of radiation is recorded in a log kept on the bridge. Recent readings show the crew is receiving a radiation dose only slightly above natural background levels.

Before crew members can work on the ship, background checks are conducted by both the company and an outside contractor. Each member also must take part in safety drills and be certified to handle haz-

well below weapons-grade, it could still be a potential target. The company says it is "absolutely fastidious" about following the volumes of international and domestic regulations designed to keep the cargo safe and out of unauthorized hands.

The nuclear transportation industry has a mostly unblemished track record. While vehicle accidents have occurred over the past 40 years, industry experts say, there has never been a deadly radioactive spill or loss recorded during the transport of nuclear materials. Uranium shipments have rolled across the docks in Baltimore for decades with little notice.

Reduced risk

Transportation Logistics won't talk about its security measures other than to say that some procedures change when national alert levels shift from yellow to orange. But the company points to a number of factors that it says reduce the risk that the cargo it carries could ever be diverted for illegal purposes.

The uranium hexafluoride and other materials it transports are extremely dense, making each cylinder so heavy it can't be lifted without a crane or other special equipment. Even if one were stolen, the material would have to undergo considerable processing that requires sophisticated technology to be used in a nuclear bomb.

And since it emits a relatively low level of radiation compared with other radioactive materials, it would have limited value as a "dirty bomb," which uses conventional explosives to spread radioactive materials over a wide area, Fisk said.

"I think ... they would look for something that's far more potent and dangerous," he said.

No firm statistics are available on the annual number of uranium shipments. But the global nature of the industry makes transportation a critical component in the nuclear fuel cycle.

It begins when uranium ore is mined in Canada, Russia, Australia and other uranium-rich countries. From there, it undergoes about a half-dozen steps in the refining process until the concentration of U-235 isotopes reaches nearly 5 percent, making it suitable for use as nuclear fuel. For economic and competitive reasons, each of the refining steps might take place in a different country.

"There's material that might originate out of the ground as ore in Canada, go to Europe to be partially processed, come to the U.S. to be processed further, then go back to Europe and finally end up in Japan," said Melissa Colvin Mann, a Transportation Logistics partner with a background in nuclear nonproliferation and international relations. "So there's a constant flow of material."

Formed in 1998, the company has 13 employees in a suburban office park in Burtonsville in

The company's biggest coup was landing a contract to transport tons of uranium that once armed Soviet nuclear weapons aimed at the United States. Part of a landmark arms-reduction treaty between the United States and Russia, the "Megatons to Megawatts" project involves diluting 90 percent pure weapons-grade uranium into a more benign form so it can be converted into fuel to produce electricity. The material is diluted in Russia before being shipped.

The program is a joint venture between Bethesda-based U.S. Enrichment Corp. and its Russian counterpart, Tenex. The 20-year, $8 billion program has converted the equivalent of about 7,000 warheads, creating enough nuclear fuel to power a city the size of Boston for about 270 years. By the time the program ends in 2013, the equivalent of 20,000 warheads will have been converted into enough fuel to power the entire United States for about two years, U.S. Enrichment officials say.

"It's a dream"

In addition to providing needed jobs for Russian scientists, the purpose of the project is to keep that country's nuclear materials from falling into the hands of terrorists or rogue nations. For Mann, whose training is in nuclear nonproliferation, the U.S. Enrichment contract is the opportunity of a lifetime.

"It's a dream," she said. "It really is a dream."

Since the *Aquila* doesn't call at Russian ports, Transportation Logistics uses other commercial ships to bring the diluted warhead material, some of which has passed through Baltimore, to the United States.

But the bulk freighter is the only ship in the world that is exclusively chartered to carry so-called "front-end" nuclear material, which consists of fresh uranium from the time it is mined until it is manufactured into fuel rods and delivered to a nuclear power plant. Front-end uranium is considered relatively benign and less controversial compared with back-end material, which consists of highly radioactive spent fuel or nuclear waste.

"It's radioactive, but not terribly so," said William H. Miller, a professor in the nuclear engineering department at the University of Missouri in Columbia. "You can stand right next to the truck and the [radiation level] would not be much elevated above background levels."

It is the movement of back-end fuels that often inspires protests from environmental and anti-nuclear groups. But environmentalists say that doesn't mean that front-end fuels like those aboard the *Aquila* are totally safe.

"I think this whole [uranium transport] industry is one that doesn't have a lot of public scrutiny on it due to the limited resources of the nonprofit community," said Tom Clements, a senior nuclear campaigner for

SUN STAFF

A small dosimeter that can fit into a hand is carried by all crew members of the TLI Aquila. It monitors exposure to radiation.

global environmental group Greenpeace International. "So a lot of this happens without the proper public oversight, but there's definitely risks."

Company officials point out that the industry frequently goes beyond government safety requirements.

The cylinders that carry uranium are made of five-eighths-inch steel and are built to withstand intense fire, collision and other pressures. The uranium is extremely dense and is not explosive, unlike many other hazardous materials.

If you rammed a truck into one, Fisk said, "You'd have to write off your truck, probably."

The Antigua- and Barbuda-flagged *Aquila*, which calls at Rukert Terminals in Canton, was designed and certified to carry hazardous materials ranging from natural uranium to finished fuel assemblies worth millions of dollars each. Built in 2000, the ship has a double-layered hull, redundant electrical systems and cooling and ventilation equipment that typical commercial vessels don't have. In the event of fire, carbon dioxide tanks will flood the cargo hold, starving the blaze of oxygen while sprinklers douse the flames.

At mealtime, the ship's 13-member crew can look up from their plates in the mess hall and know instantly how much radiation their bodies are absorbing. Six digital dosimeters are mounted on walls throughout the ship, supplementing the devices crew members carry in their pockets.

Each day, the ship's officers take a reading from the six dosimeters and e-mail the data to headquarters. Every crew member must be certified to handle hazardous materials. Because of the added expertise required, the crew gets paid a premium over their regular salary, a company official said.

The training crew members must complete covers a wide range of scenarios, including everything from a broken seal on a uranium cylinder to an attack by pirates or terrorists. Details of each crew member's training are recorded in a three-ring binder.

"We drill at least weekly, but sometimes twice per week," said Chief Mate Oleg Stukalov, a native of St. Petersburg, Russia. Most of the crew is Russian, though the captain is German.

Every time the ship comes to Baltimore it is met by Mark T. Lambert, president of Transportation Logistics' shipping subsidiary, who has a background in military intelligence and international logistics.

When new cargo arrives, he positions the cylinders of uranium in the cargo hold based on complex mathematical equations that take into consideration the radioactivity level of each shipment. Regulations govern how much space must separate the containers to prevent them from interacting and causing a radioactive release.

"When you're handling these materials, you can't just throw them on the vessel any old where," Lambert said.

Multiple certifications

The scrutiny continues once the ship leaves port. The design and construction of the containers used to carry the uranium must be certified by international regulatory agencies and government regulators in every country that the material will travel to. That means that cylinders have to be certified in every country where the ship makes a port call, regardless of whether the uranium ever leaves the vessel.

"This can sometimes take a year to a couple of years to get completed," said Norman Ravenscroft, president of Transportation Logistics.

While in Baltimore recently, the *Aquila* off-loaded empty cylinders used for transporting natural uranium hexafluoride, which from a distance look like giant beer kegs. The crew used the ship's two 80-ton cranes to lift the containers out of the hold and onto trucks, which transported them to a nearby warehouse. Radioactive cargo stays in port only long enough to be transferred to a truck for delivery to customers, usually within one to two days.

Before leaving Baltimore, the ship took on another shipment of radioactive cargo destined for customers in Europe. The company keeps the precise contents and destination secret, for competitive and security reasons.

"We're protecting our customers' financial assets," Fisk said. "You're looking after it because there is an obligation, obviously, that the material is protected and won't fall into unauthorized hands."

Uranium going to Paducah was shipped to wrong site

Officials: Error did not produce security problem

By JAMES MALONE
jmalone@courier-journal.com
The Courier-Journal

BY STEVE DURBIN, THE C-J

PADUCAH, Ky. — The Nuclear Regulatory Commission is investigating the mistaken shipment to North Carolina of six metric tons of blended Russian uranium intended for the Paducah Gaseous Diffusion Plant.

But an NRC spokesman said no safety issue was involved when the uranium consigned to the United States Enrichment Corp., which operates the Paducah plant, went instead to Global Nuclear Fuel LLC, a nuclear fuel fabrication plant in Wilmington, N.C.

"It was received at a facility authorized to take it," said Roger Hannah, an NRC spokesman in Atlanta. The Paducah plant enriches uranium for use as nuclear reactor fuel. Global takes the fuel and shapes it for reactor use.

The Department of Homeland Security, the federal agency that investigates potential terrorism threats and security breaches, would not become involved in the investigation unless criminal intent was suspected, spokesman Ben Quevedo said.

The error occurred when a trucking company, Transport Logistics International, misdirected two similarly numbered loads of uranium from a Virginia dock, said Rod Fisk, the company's chief executive officer. One of the shipments was originally destined for Wilmington, and the second shipment was to go to Paducah, he said.

Fisk said the shipping error was quickly detected and Global was notified that the shipment meant for Paducah also would be coming. Fisk said the trucking company asked that the shipment be held at Wilmington over the Christmas holidays before it was shipped to Paducah.

"It was never lost," Fisk said.

Elizabeth Stuckle, a spokeswoman for USEC, said the uranium was en route from Wilmington to Paducah yesterday. She said the shipment had been held under tight security since it was picked up Dec. 19 in Norfolk, Va. She said the trucking company alerted USEC about the misdirected shipment after the holidays.

USEC is the U.S. agent to buy uranium blended from Russian nuclear warheads.

It has purchased or agreed to purchase almost $7.5 billion worth of the material to be imported and processed into reactor fuel. The weapons-grade uranium is diluted before being shipped to the United States.

The company processes the uranium at the Paducah plant. It is the nation's only commercial facility to enrich uranium.

The incident comes at a time of heightened security against terrorism, and experts have raised concern about the potential to build a "dirty bomb," a conventional explosive that uses low-level nuclear fuel.

Thomas Cochran, a nuclear expert with the Natural Resources Defense Council, said that since the integrity of the shipment was never compromised, it "was not a big deal" but might prove to be an embarrassment.

The uranium from Russia "was received at a facility authorized to take it."

Roger Hannah, a Nuclear Regulatory Commission spokesman

To: rod.krich@exeloncorp.com
Subject: Transportation of Depleted UF6 and U3O8

Good afternoon Rod,

You have requested that I clarify my comments to the effect that variation in the distance that material has to be moved has a minimal effect on the overall transportation costs for transporting depleted uranium hexafluoride in 48X/48Y cylinders and drums of U3O8, in a 20' ISO container. These are the standard industry methods for moving these materials.

Given the fact that overhead costs for transportation of radioactive materials include: material packaging, marking and labeling, communications, vehicle tracking, vehicle maintenance, driver training, security, loading and unloading of cargo, insurance etc. the impact of additional mileage, which affects only time and fuel, amounts to fractions of a cent per kilogram/mile. In a dedicated program where vehicles, manpower and equipment are managed for optimal efficiency, the effect of mileage can probably be reduced even further.

Please do not hesitate to contact me if you need additional information.

Sincerely,

Rod Fisk
Chief Executive Officer
TLI Inc.

'Minor bump' causes big scare on U.S. 60

JOHN WRIGHT/The Sun

Joe Cole, Barlow, looks at what remains of his pickup truck, which was crushed under the trailer of a semi hauling radioactive materials Thursday on U.S. 60 west of Paducah. Cole was not injured.

Pickup hit semi hauling radioactive material

By Shelley Byrne
The Paducah Sun
sbyrne@paducahsun.com

Joe Cole said he felt lucky to be alive after the underside of a tractor-trailer rig carrying radioactive material impaled the passenger side of his pickup truck's windshield in a wreck Thursday morning.

"This is twice now for this to happen to me," said Cole, 27, of Barlow, adding that he escaped harm in another wreck a few years ago in St. Louis. "I'm just glad I didn't have my kids in the truck with me.

"After it happened, I just wanted to get out because I was afraid of it catching on fire. I just feel blessed that nothing happened. I'm blessed to be standing here."

No one was injured and none of the four containers of uranium hexafluoride leaked during the wreck at 10:33 a.m. on U.S. 60, just east of Hobbs Road.

Cole was passing the rig and a van driven by Shawn Beach, 21, of Paducah when the van veered into the passing lane and clipped Cole's pickup truck, McCracken County Deputy Sheriff Jeremy Partin said.

The impact sent the pickup into the side of the tractor-trailer, which was driven by Harry Allison, 50, of Reardan, Wash. The rig is owned by R&R Trucking of Duenweg, Mo. It was carrying four reinforced 2½-ton cylinders of uranium hexafluoride from the Paducah Gaseous Diffusion Plant and was bound for the port in Oakland, Calif., where it was to be shipped to an overseas customer. A second truck arrived about an hour after the wreck to take possession of the load.

Elizabeth Stuckle, spokeswoman for USEC, said the truck was the last of four in a convoy, each carrying about 5,000 pounds of the enriched uranium.

Uranium hexafluoride is a chemical compound used during the uranium enrichment process. The low-level radioactive compound is used to fuel nuclear reactors. In its solid form, the compound is a white, dense, crystalline material that resembles rock salt.

The material is transported in "protective overpacks designed to protect the cylinders in a major accident," Stuckle said.

"This was just a minor bump," she said. "The trucks had just pulled out onto the highway, and they were going slow."

Cole was cited on a charge of driving on a suspended license. Beach was cited for not having insurance.

Once loads leave the plant property, they become the responsibility of the trucking company; however, several officials from plant operator USEC also went to the wreck scene.

"We're trained to respond, and part of the job is to see what damage there is," said Mary Thomas, senior resident inspector for the National Regulatory Commission office on the plant grounds.

Stuckle said USEC ships about 1,200 cylinders of the substance on about 300 trucks in a typical year. USEC supplies 27 percent of the world's uranium, providing fuel for 150 reactors on three continents, she said.

USEC contracts with Transport Logistics International, the largest transporter of nuclear material within the United States.

Rod Fisk, president of TLI, said wrecks of this sort are "extremely rare."

Joe Cole, Barlow, checks his cell phone after retrieving it from his wrecked pickup, still crumpled under the trailer of a semi carrying radioactive materials Thursday.

Subject: Russian uranium

Good afternoon Doug,

Hope all is well and that you are not suffering from the incredible heat we are having at the moment?

The attached article is of interest as I believe it highlights the ongoing resolve in Russia to gradually and systematically acquire and control global energy resources. I spoke with a senior Uranium One Executive (the company was formed in South Africa and I know the former Chairman and some of the senior personnel) and he said that corporate Management was not even told before the announcement was made. There are a lot of concerns and several have said confidentially that they will support the sale to ARMZ, get their $1.06/share payout, sell their shareholdings and then resign. The premium of a dollar per share, on a stock-price of just over two dollars per share, is also pretty strange.

One of my neighborhood colleagues who has a powerboat next to me in the marina told me his electrical system was fried by lightning on Tuesday evening, during a storm which came through here. I went down to Mujaji this morning to check and everything seems to be OK. I have a very large cable leading from the foot of the mast to the keel bolts and the whole electrical system is protected by some heavy duty fuses and circuit breakers (the Germans are pretty thorough in that regard) so maybe I was just lucky. I find it strange however as my mast is a good 30 feet higher than the fly-bridge of his boat.

Best regards

Rod

Despite price fall, ARMZ confident of Uranium One shareholder approval
Shares in the Canadian firm have fallen as much as 16% since the deal with Russian state-controlled nuclear group were first announced.
Author: Eric Onstad (Reuters)
Posted: Monday, 21 Jun 2010
LONDON, (REUTERS) -
Russia's ARMZ is confident Uranium One shareholders will approve a plan for ARMZ to take control of the company, despite a tumble in its share price due to uncertainty over the deal.
Shares in Canada's Uranium One have shed as much as 16 percent since June 8 when it unveiled a deal for Russian state-controlled nuclear group ARMZ to boost its holding to 51 percent in exchange for stakes in two Kazakh uranium mines.

"I'm 100 percent positive (it will be approved). All the shareholders whom I talk to, by the end of the conversation, they become excited about the transaction," ARMZ General Director Vadim Zhivov told Reuters on Monday in London.
Some analysts had worried that Russia's goals might be at odds with minority shareholders, who are due to receive a $1.06 special dividend as part of the deal.
ARMZ is keen to keep minority shareholders happy because it may use Uranium One shares to pay for further acquisitions as it aims to capture a top-three ranking in the sector, Zhivov said.
If the deal is approved, Uranium One will immediately vault to the fifth ranking in terms of production from ninth.
Holding on to its status as a low-cost producer, however, is more important than volumes, he added.
Its growth programme will target Kazakhstan -- which became the world's largest uranium producing country last year, jumping ahead of Canada -- and Africa, Zhivov said in an interview.
The company will focus not only on Namibia, where many companies are already operating, but other areas as well.
"We'll talk to all the interested parties... There are lots of interesting discoveries in Tanzania, for example, and some other regions of Africa. Namibia obviously is an interesting place, but it's not only the companies, there's a lot of prospective areas for exploration purposes."
ARMZ formed a exploration venture in Namibia -- SWA Uranium Mines -- two years ago with two partners.
There is also scope for more growth in Kazakhstan, a country sparking keen interest from rivals, including diversified miners BHP Billiton and Rio Tinto, Zhivov said.
"We've been approached while operating in Kazakhstan by every single major mining player to give them a chance to operate uranium deposits in Kazkahstan," he said, adding that this took place before it agreed a deal with Uranium One.
"To the best of my knowledge, Rio Tinto, BHP Billiton are interested in Kazakhstan, I just don't know any single player who is not."
Rio and BHP are the world's fourth- and sixth-biggest uranium producers based on attributable 2009 output.
Uranium prices were likely to be flat over the next few years, but have good potential for long-term growth due to strong expected expansion in new nuclear plants, he added.
The spot uranium price has shed about a quarter over the past 12 months to $40.75 per pound and is well down from its peak of $136 in June 2007.
"I would say that the price is going to be stable for the next couple of years, which suits Uranium One perfectly... There is no danger for the lowest-cost producer."
The market should tighten after 2013, when secondary supply from Russia is expected to dry up and a massive reactor building programme in China, India and Russia creates more demand, he said.

Mr. Rod Fisk

Fulton, MD - August 12, 2011

It is with great sadness that we report the death of ***Mr. Rodney H. Fisk****, former president and CEO of Transport Logistics International.* ***Mr. Fisk joined TLI shortly after it's founding in 1998, and served as CEO until his retirement in late 2009.***

Mr. Fisk had over two decades in the nuclear industry. ***Prior to his work at TLI, Mr. Fisk served as Executive Vice President at Edlow International. His early career was spent as a senior Foreign Service Officer in the government of South Africa****. There he obtained knowledge and experience in the fields of bilateral and multilateral Peaceful Nuclear Cooperation Agreements and import and export control regimes applicable to nuclear materials worldwide.*

Mr. Fisk was instrumental in a number of key national and international programs, including the MEGATONS to MEGAWATTS program.

Prior to becoming engaged in nuclear activities, ***Mr. Fisk obtained academic qualifications in the natural sciences, which have enabled him to interact with environmental groups*** *from a practical and theoretical perspective, based upon extensive conservation experience.*

After Mr. Fisk's retirement in 2009, he was still actively involved in the nuclear industry, serving as a consultant to a number of companies.

Mr. Fisk's knowledge and leadership will be greatly missed.

Page 150 : "

An upper bound estimate of the amount of plutonium in the core can be determined from information about irradiated fuel discharged from the TRR. Following the U.S. actions in the late 1970s aimed at end- ing Taiwan's nuclear weapons efforts, the United States insisted that all the irradiated fuel from the reactor be removed and scrutinized. A core load of fuel containing 137 fuel elements was discharged.19 Each fuel element contained about 54 kilograms of natural uranium, giving a total of about 7.4 metric tonnes of uranium in the core, somewhat less than a full core load of about eight metric tonnes. By using Department of Energy data on the average amount of plutonium in the irradiated fuel returned to the United States, 137 fuel elements would contain up to about 7.2 kilograms of plutonium, where the upper bound assumes 52.6 grams of plutonium per fuel element (or about 0.97 grams of plutonium per kilogram of ura- nium).20,21 This is an upper value of the amount of plutonium in the core because not all of the irradiated fuel was discharged at its full burnup, so those elements on average had a lower amount of plutonium per fuel el- ement.22 However, on average, the plutonium was likely weapon-grade. "

Page 176 : "

21 Another example of the plutonium content in irradiated fuel is from a shipment of 91 irradiated fuel elements in 15 containers, which may be part of the last one that was blocked by a court order from coming to the United States [Source: Undated table from ***Rod Fisk, Edlow International Company****]. These 91 fuel elements, with a mass of 4.632 metric tonnes, contained 4.1 kilograms of plutonium, or an average of 42.2 grams per fuel element. The fuel elements had an average of 0.86 kilograms of plutonium per metric tonne of uranium and the uranium had an average of 0.6162% uranium 235. The irradiation level, or burnup, was not provided but these elements appear to have had a lower burnup than that of the fuel rods discharged in 1977 and discussed above. The plutonium may not have been weapon-grade but it would contain more than 90 percent plutonium 239, which is high quality plutonium.*

[HN001V][GDrive]

Joseph B. Flavin Is Dead at 58; Led Overhaul as Singer Chairman

By JAMES BARRON

Joseph B. Flavin, chairman and chief executive officer of the Singer Company, died yesterday at Norwalk Hospital. He was 58 years old and lived in New Canaan, Conn.

Mr. Flavin joined Singer in 1975 and oversaw its evolution from the world's best-known manufacturer of sewing machines to a military contractor.

At the start of his tenure, critics were saying that Singer had spread itself too thin. One big problem was the company's plunge into the making of electronic cash registers for department stores and supermarkets. Mr. Flavin, who was regarded by many on Wall Street as an astute planner and an expert in doing business abroad, quickly pulled Singer out of business machines and began restructuring the rest of the company.

An Overhaul of Its Identity

Last year he even spun off the sewing machine business, which had been the essence of the company's identity from the time it was founded in 1851. As he acknowledged in a 1984 interview, what had begun in the mid-1970's as a gradual retreat from unprofitable sidelines turned into an overhaul of the company's identity.

"This is a company whose whole culture was built around the sewing machine," Mr. Flavin said then. "As hard as we tried, that couldn't be changed overnight."

Mr. Flavin's efforts left Singer a streamlined technology company that draws 80 percent of its revenue from aerospace electronics.

Soon after joining Singer, Mr. Flavin recognized that social and economic forces were causing a rapid decline in the United States sewing machine market. Chief among these was an increase in the number of women with full-time jobs. Another factor was the increasing availability of lower-priced imported clothing, which reduced consumers' need to repair old or damaged clothes.

By 1979, when the full extent of Singer's troubles had become clear, Mr. Flavin took action to trim the company's losses. Singer closed its two major sewing machine plants. One was in Elizabeth, N.J., the other in Scotland. At the same time, the company shifted its sewing machine manufacturing to plants in Taiwan and Brazil, where labor costs were less expensive.

The company also closed or sold its 1,600 retail sewing machine stores to independent dealers.

In Mr. Flavin's 12 years as head of Singer, the company's headquarters were moved twice, from 30 Rockefeller Plaza in Manhattan to Stamford, Conn., in 1978, and from Stanford to Purchase, N.J., last year.

In August the Texas investor T. Boone Pickens announced that he had 4.4 percent of Singer's stock. Mr. Pickens's investment company, Mesa Partnership Ltd., said at the time that it might buy as much as 15 percent of Singer.

Mr. Flavin, who was born on Oct. 16, 1928, received a bachelor's degree in business administration from the University of Massachusetts in 1953 and a master of science degree from the Columbia University Graduate School of Business four years later. He also studied at the International Business Machines Corporation's executive school and the Williams College program in American studies for executives.

In 1978 he was awarded an honorary doctor of laws degree from the University of Massachusetts.

The New York Times

Joseph B. Flavin

Tenure With Xerox

Before joining Singer, Mr. Flavin was president of international operations as well as a director of the Xerox Corporation. He had joined Xerox in 1967 as vice president and controller and was promoted rapidly.

Mr. Flavin also spent 14 years at I.B.M.'s world trade division and was controller from 1965 to 1967.

He was a director of Pfizer Inc. and the New York Stock Exchange and a trustee of Northwestern Mutual Life Insurance Company.

He is survived by his wife, Melissande; a son, Patrick, and a daughter, Shawn, both of New Canaan, and six grandchildren.

Heart Recipient Dies

HERSHEY, Pa., Oct. 7 (AP) — The Rev. John Urban, who was kept alive for nearly 11 days by an artificial heart before receiving a human heart and kidney, died after multiple organ failure Tuesday at the Milton S. Hershey Medical Center of the Pennsylvania State University. He was 51 years old. Mr. Urban was the third recipient of the Penn State artificial heart. He received the donor heart and kidney on Sunday in an 11-hour operation, the first such combination surgery done at the medical center.

Singer Head Dies After Short Illness

October 7, 1987

MONTVALE, N.J. (AP) _ Joseph B. Flavin, who helped transform the Singer Co. from a sewing-machine maker into a leading aerospace and electronics concern, died Wednesday at age 58, the company said.

Flavin, chairman and chief executive of the company, became ill at his New Canaan, Conn., home Wednesday morning before he was to make his regular commute to Singer's offices here, and was pronounced dead a short time later at an area hospital, said Thomas Elliot, vice president for corporate relations.

Elliot did not know the cause or time of death. A company statement said Flavin died "after a short illness."

Singer elected William F. Schmied to succeed Flavin as chairman and chief executive officer, the company said. Schmied will retain his former position as company president.

Schmied, 58, has served as president and chief operating officer since 1980, and has been with Singer since 1969.

Under Flavin, Singer concentrated on aerospace electronics, which now accounts for more than 80 percent of the company's revenues.

In 1980, Singer shut its last U.S. sewing machine plant, which had been in business in the industrial New Jersey city of Elizabeth for more than a century. Last year, Singer spun off its former sewing operatins into a new company, SSMC Inc.

The company moved its executive offices in August to Montvale from Stamford, Conn.

Before becoming Singer's chairman, Flavin was president of international operations, executive vice president and a director of Xerox Corp. He also spent 14 years in executive posts with International Business Machines World Trade Corp.

"Joe Flavin's contributions to Singer were outstanding in their scope and impact in strengthening the company and positioning it for an excellent long- term future," Schmied said. "We all feel a deep sense of loss and regret."

Flavin, born Oct. 16, 1928, received a degree in business administration from the University of Massachusetts in 1953 and a masters degree from the Columbia University Graduate School of Business in 1957.

He is survived by his wife, Melisande; a son, Patrick; a daughter, Shawn; and six grandchildren.

1975 (Sep 14) - Daughter marries - Shawn Flavin Bride of Roy Russell

Source - [HN001Z][GDrive]

Shawn E. Flavin, daughter of Mr. and Mrs. Joseph B. Flavin of New Canaan, Conn., was married yesterday afternoon at her parems' home, to Roy Dallas Russell, son of Mr. and Mrs. A. Lewis Russell of Sarasota, Fla., formerly of Stamford. Conn.

The Rev. Thomas S. Fitzgerald, president of Fairfield University, performed the ceremony.

Mr. Flavin is executive vice president of the Xerox Corporation and president of its international operations. The bridegroom's father, who is retired, was director of industrial security for the Exxon Corporation.

Mrs. Patrick Flavin, sisterin-law of the bride, was matron of honor. The bridesmaids were the Misses Becky Russell, sister of the bridegroom, and Ellen Scanlan. Nicole Noël Flavin, niece of the bride, was flower girl. Bart van Rees was best man.

Mrs. Russell graduated from Trinity College in Hartford. She is a third-year student at the New York Medical College, as is her husband, who is a University of Connecticut graduate.

Sewing machine days are over; Singer's on a roll

The Singer Company was first born in 1851, when Isaac Merritt Singer patented a device that could do continuous stitching. The sewing machine proved to be one of the most successful products ever invented, providing jobs and clothing for innumerable people, as well as more than a century of profits for Singer itself.

Singer was fully reborn last fall as a leading producer of defense electronics. The change follows a decade of painful restructuring caused by factors both within and outside the company's control.

When the current chairman and

chief executive, Joseph Flavin, left Xerox in 1975 to head Singer, the company was burdened by a number of errant acquisitions. No sooner had these been written off or divested than the market for sewing machines began to erode, a result of the changing habits of traditional women buyers.

At its nadir in the late 1970s, "we were probably past bankruptcy," Mr. Flavin recalled. "We owed $1.1 billion and the equity was $306 million. The only reason we could maintain that leverage was the banks had already loaned us all that money."

The stock bottomed out in 1980 at a little more than $6 a share, but in retrospect the company had already begun to turn around. Strong emphasis was placed on a burgeoning defense segment and, in a move that still shocks many who grew up believing Singer meant sewing machines, a decision was made to divest the sewing machine division.

The rationale was twofold: First, the requirements for running an international consumer business differed from those needed for one in high-technology aerospace, Mr. Flavin said. Secondly, management felt, and analysts agree, that the stock market would never grant Singer the rich multiples typical for high-growth businesses until the mature sewing machine division was weeded out.

Last October, after Singer had successfully completed a turnaround in the division, it was spun off to shareholders as a new company called SSMC Inc.

"Our recent history has been tumultuous, to say the least," Mr. Flavin said, noting that because of the divestiture the new Singer Co. has emerged only in the last nine months.

The company's mottled past makes many financial comparisons irrelevant. Indeed, even the post-October movement of its stock may say little. That's because when the stock

See **SINGER,** 10C, Col. 3

[HN0020][GDrive]

Sewing machine days gone at Singer

MONDAY, MAY 11, 1987

SINGER, from 9C

came out at $50 a share, its price was heavily influenced by tax and arbitrage factors. Investors used complex strategies to buy and sell both Singer and SSMC to create artificial losses.

The stock plunged to a post-divestiture low of $37.25 a share in December, a price some institutions found irresistible. "At that point, we thought there was no risk in buying the stock," said Gerald Levine, a partner in Weiss Peck and Greer, an investment management firm that purchased 392,000 shares.

The stock has since partially recovered, hovering around its current level of $44 a share. How much farther the stock has to go is a source of debate among analysts, though even the most pessimistic feel it could be due for another jump. That's because Singer now sells for about 13 times earnings (adjusted for the divestiture), while other defense contractors specializing in electronics are typically priced at 17 or 18 times earnings.

"There's still misperception that the company still makes sewing machines," said Michael R. La Tronica, director of research at the Redding Research Group. "Once the market hops on the bandwagon, there'll be a rapid upward move in the stock."

Fundamentally, the company has a number of positive attributes, although it's not considered to be without risk.

Its Simuflight division, which provides training for commercial and military products, appears be taking off after losing about $35 million in the past two years. It recently received a $244 million contract to train pilots of C-130 military transport planes, and already operates a major training facility for Continental Airlines. Since training through simulation is far less costly than using actual flight time, the company and Wall Street predict the division will grow as budgets tighten.

That reversal will be a nice addition to a number of profitable divisions developing radar, navigation and communications products and electronic warfare systems. Margins for products in virtually all of its divisions are due to expand as products come out of development.

"The question is, when do they turn on the production faucet?" said Phil Friedman, an analyst with Drexel Burnham Lambert Inc. "I believe it will be in late 1988 or 1989."

Of tremendous concern on Wall Street is whether, in an era of increasingly austere military budgets, many of these products will ever go into production. But as with the case of flight simulation, Singer has made a case that its offerings become more attractive as money becomes tighter.

"In general, Singer's products allow you to take an old platform [plane, ship or missile], upgrade the electronics and avionics, and get most of the performance a new model would provide at a third of the cost," said Redding's Mr. La Tronica.

Others are less sanguine. "We're not enthusiastic about anything in the pure defense area," said Michael Gardner of Shearson Lehman Brothers. Programs in development are more susceptible to cost overruns and cancellations than those in production, he added.

Agreed Steven Binder of Bear Stearns: "The bottom line is that there are long-term questions about the profitability of many of its defense contracts. Singer has a lot of attributes, but I think it's fair to say the earnings outlook remains clouded."

Furthermore, Mr. Gardner said, although Singer is a leader in every area in which it operates, there are few places it stands alone, making it vulnerable to intense competition or second sourcing, "so one would not expect Singer's profit margins to be as high as other defense electronics companies."

For Singer, 1987 has begun well. Profits are up significantly in not only defense, but also in its motor products division — cash cows that sell power tools and other products, primarily through Sears, Roebuck and Co.

And compared to the problems of several years ago, Singer is on a roll. When the stock of SSMC is included, one share of Singer bought in 1980 at $6 is worth more than $50 today.

Singer weathers changes

Today's owner, founding father both cut from same cloth

By Eric Reguly
Financial Post

NEW YORK — **Singer Co.** today bears absolutely no resemblance to the Singer whose sewing machines were flogged from Connecticut to Cape Town for more than a century. Singer doesn't even make them any more.

But, in one sense, the company has come full circle since its formation in the mid-1800s: Its founder, Issac Singer, and its current chairman, Paul Bilzerian, appear to share some traits.

Issac Singer was a barely literate wanderer who didn't care about his fabulously successful sewing machines. He once said: "I don't care a damn for the invention. The dimes are what I'm after."

Paul Bilzerian is a high-school dropout who, in 1985, was described in a lawsuit as an "obscure individual of indeterminate means." Nor does he have any emotional ties to the products made by the company he bought 14 months ago. He's after dollars — millions of them — not dimes. Since his Singer acquisition, Bilzerian has sold off most of the company.

This past week's lawsuit against Singer helped underscore the fact that it bears little resemblance to the once-great multinational.

The U.S. Justice Department accused the company of overcharging the Pentagon by US$77 million from 1980-88. The government said the Singer Link Flight division wrongfully enriched itself by secretly inflating cost estimates on flight simulators sold to the military.

May face surcharge

The government's action joins a suit by a former Singer employee who blew the whistle on the company. Filed under the False Claims Act, it calls for damages of US$231 million.

Although it appears that most of the alleged cost-inflation occurred before Bilzerian acquired Singer, the 38-year-old Floridian may face a surcharge on his acquisition if the Justice Department wins its case. Under U.S. civil law, liabilities flow to successor companies.

CAE Link Corp., the successor to the Link Flight division, was named as one of the three defendants. The company is owned by Toronto-based **CAE Industries Ltd.**, which bought it from Bilzerian last August for $665 million. Singer's general counsel said the accusations were "completely without merit" and said Singer would co-operate with CAE in a vigorous defence.

The cost-inflation suit isn't the first time Bilzerian and Singer have made headlines in Canada.

Bilzerian, best known as a corporate raider, backed white knight Edward DeBartolo in his US$3.55-billion bid in 1986 for **Allied Stores Corp.** Toronto's **Campeau Corp.** won the company, but Bilzerian went away smiling with almost US$7 million in fees in his pocket.

Bilzerian's corporate raids have since come back to haunt him. He was indicted in December on 12 felony counts linked with four unsuccessful takeover attempts in 1985 and 1986 (Allied was not one of them). The indictments covered alleged securities and tax fraud, conspiracy and making false disclosure statements. Bilzerian pleaded not guilty.

Then, through no fault of its own, Singer emerged as a key player in the two-way battle for **SSMC Inc.** of Shelton, Conn. Spun off from Singer in 1986 as part of a massive restructuring, SSMC holds the exclusive rights to the Singer trademark and manufactures the sewing machines that made its former parent famous. Singer owns 27% of SSMC.

The battle pits Toronto's **International Semi-Tech Microelectronics Inc.** against **Inter-Pacific Acquisition Corp.**, a company formed by Malaysian investor Vincent Tan to acquire SSMC. Acquiring Bilzerian's 27% stake in the company is key to the deal.

Semi-Tech, through its Hong Kong subsidiary, launched a tender offer for SSMC on Feb. 2 at US$30 a share, then raised it to US$34 when Tan burst onto the scene with a US$33 bid. Tan put the ball back in Semi-Tech's court this past week when he layered another US$4 onto his bid.

Meanwhile, SSMC had agreed to sell its furniture division to Bilzerian if Semi-Tech's offer is successful. Although it went unstated, the agreement presumably hinged on the understanding that Bilzerian would tender his shares to the Canadian group.

Singer's 27% interest in SSMC is one of its few remaining assets. But downsizing was a process that began before Bilzerian's arrival. As a sewing machine maker, Singer's world franchise started eroding more than 20 years ago.

Life essential

The machines were considered a life essential in practically every country in the world. It wasn't until after World War II, as markets became saturated, that the company began to diversify. But the strategy wasn't entirely successful.

By the mid-1970s, Singer had US$1 billion in debt and took a massive US$400-million writedown on loser businesses. Its portfolio included a housing developer, a lake, air conditioning, defence electronics, and a sensationally disastrous business machines arm.

The bobbin turned on its sewing machine business, too. Competition from foreign companies helped cause its unit sales to drop by 50% in the 1970s. Faced with a dying market, Chairman Joseph Flavin, who arrived at the company in 1975, transformed it largely into an aerospace and electronics company catering to the military. Under Flavin, Singer experienced a modest renaissance.

Flavin shifted the manufacture of its sewing machines to plants in Brazil and Taiwan to take advantage of lower labor costs. He also closed or sold its 1,600 retail sewing machine stores. Finally, he spun off the sewing machine business entirely and left it with SSMC.

Meanwhile, its Link Flight Simulation division expanded to become a world leader.

The death of Chairman Flavin on Oct. 7, 1987, and the market crash less than two weeks later left the company vulnerable to takeover. Bilzerian pounced and met little resistance.

Within half a year, Bilzerian had recovered all but US$200 million of US$1.9 billion in acquisitions costs. The sale of the Link Flight division to Toronto's CAE was the biggest single sale. Only a handful of businesses, such as the British-based Link Miles simulator division, remain.

The Singer story

1850: Improving on an old idea, Isaac Singer makes commercially successful sewing machine. Price: US$125 apiece, a small fortune.

Early 1900s: Singer Co. sells more than one million sewing machines a year worldwide.

1950s: U.S. market for sewing machines matures; Singer expands overseas while diversifying at home.

1963: Singer buys business machines company, an ultimately disastrous acquisition.

1976: Joseph Flavin takes Singer helm as chairman. Company takes US$400 million writeoff from loss-making diversifications. Begins overhaul of Singer into an aerospace and defence contractor.

1978: Suffering from foreign competition, Singer begins losing money on sewing machines. Production shifted overseas. Retail stores closed and sold.

1986: Singer spins off sewing machine division. SSMC Inc., 27% owned by Singer, becomes sewing machine maker.

1987: Flavin dies. Paul Bilzerian launches takeover bid Nov. 2.

1988: Bilzerian wins Singer in January, begins dismantling company. Sells Link Flight division to Toronto's CAE Industries Ltd. in August for $665 million. Bilzerian indicted for tax and securities fraud in December.

1989: Two-way battle for Singer's 27% stake in SSMC begins in February; Singer sued by government for alleged cost inflation on Pentagon contracts in March and CAE named as defendant.

Sir Walter Morley Fletcher, KBE, FRS [1] (21 July 1873 – 7 June 1933)[2] was a British physiologist and administrator. Fletcher graduated from Trinity College, Cambridge and was most significant in his administration of the Medical Research Council (MRC) during the interwar years. Under his guidance, the MRC focused its funding on basic scientific research at the expense of clinical research but he made Britain a leader in biomedical research in the period.

OBITUARY NOTICE. WALTER MORLEY FLETCHER. (1873-1933.)

source - Biochem. 1933 xxvii

OBITUARY NOTICE. WALTER MORLEY FLETCHER. (1873-1933.) THE death of Sir Walter Fletcher, Secretary of the Medical Research Council, on June 7th, in the sixtieth year of his age and the nineteenth of his tenure of an office he had made great, removed with tragic unexpectedness a public servant who by sheer merit had raised himself to be the trusted captain and apologist of a great host of workers striving in their many different ways and for the most part in the seclusion of the laboratory for the advancement of scientific medicine. These now mourn the loss of a friend. Medical research, as the late Sir Walter never ceased to emphasise in many a weighty and admirably drafted pronouncement, calls to its service the labour corps of many ancillary sciences and from none perhaps does it expect more help in the solution of its increasingly complicated problems than from Biochemistry. To the members of the Biochemical Society, therefore, of which Fletcher was an original member, his loss is a particularly severe one, in that his appreciation of the part that Biochemistry has to play in the general advancement of medical science came from his own discipline and distinguished performance in physiological chemistry throughout a period of nearly twenty years. Undoubtedly Fletcher would have called himself a physiologist first and foremost, but, so far as concerned the particular problem to which his laboratory life was dedicated, he had the clearest vision of its further illumination when helped on its way by modern biophysics and modern biochemistry-a vision that has more than materialised. The many appreciations of the late Sir Walter which have already appeared and their varied sources are eloquent testimony to the numerous links he had forged between the laboratory worker and the outside world of affairs. His task may be said, indeed, to have been to explain the day's work-the 'pya Kat 5,utEpat-of the laboratory to a non-scientific and not always too appreciative public, a public, however, which paid the piper and might even, if unwisely guided, call the tune. Fletcher was the conductor in fact of a great orchestra of many and strange instruments, and it was his business to harmonise and co-ordinate the tunes of each to the greater glory of medical progress. "Instruments," I venture to think, would have pleased him. It was a favourite notion of his that disciplines should be divided not according to their matter but according to their methods and that the latter alone had in them the seeds of universal value. What then were Sir Walter's antecedents and how was it that he, a devoted man of science yet not unfamiliar with affairs, resigned his place in the orchestra to become its conductor when the call came to him just before the outbreak of the great war? Fletcher began his academic career in 1891 when he entered Trinity College Cambridge. Three years later he graduated with

the outbreak of the great war! Fletcher began his academic career in 1891 when he entered Trinity College Cambridge. Three years later he graduated with first class honours in the Natural Science Tripos, and from that date for nearly twenty years the Cambridge School of Physiology was his workroom and Trinity College, of which he was elected

a Fellow in 1897 and to whose affairs he was devoted, his real home. His clinical training in medicine he took at Bart.'s and in 1900 he obtained his Cambridge M.B. Throughout his whole Cambridge career Fletcher's immediate scientific interests were centred almost exclusively in the problem of muscle respiration, an important field of enquiry in which, at the outset of his work, little or no certain knowledge was available. Between 1898 and 1914 he contributed to the Journal of Physiology a valuable series of papers on this subject, including two in collaboration, respectively, with Hopkins and G. M. Brown. These papers definitely established Fletcher's reputation as a physiologist of distinction. His first contribution in 1898 on the survival respiration of muscle was a substantial one. of nearly a hundred closely reasoned pages, and fully documented, the elaborate apparatus of which he made use for continuous estimations of CO_2 being a modification of that devised by F. F. Blackman for research on gaseous exchange in plant leaves. The work was carried out during his tenure of the Coutts-Trotter Studentship and was communicated to the 4th International Physiological Congress which met in Cambridge in August of that year. The normal curve of CO_2 discharge from excised frog muscle was fully worked out and the effect thereon of various poisons and temperature changes. Of fundamental importance was his observation that in an excised muscle which has been made to contract, there was no accompanying increase in the rate of CO_2 discharge. Throughout this work Fletcher took pains to exclude from consideration late yields of CO_2 arising from putrefactive changes in the muscle. In his second and third papers in 1902 another important stage was reached when, in investigating the influence of oxygen on the survival respiration of muscle, he showed that loss of irritability in a surviving muscle is greatly delayed by an abundant supply of oxygen. In 1904 he recorded the fact that exposure of a fatigued muscle to an atmosphere of oxygen restored to it, in a marked degree, the osmotic properties of resting muscle. In 1907, in collaboration with Hopkins, appeared a most important contribution to the biochemistry of muscle showing that contraction of excised muscle is regularly accompanied by an increase of lactic acid and that, if the fatigued muscle is placed in oxygen, the lactic acid already formed disappears. The paper contains also the technical details of a new colour reaction for lactic acid devised by Hopkins for this work. Later papers in 1911, 1913 and 1914 (the last in collaboration with G. M. Brown) continue the discussion of lactic acid production particularly in connection with its alleged formation during autolysis and its formation in mammalian muscle. Fletcher's work and that of his collaborator Hopkins laid the foundations on which was built the elaborate treatment on thermodynamic lines of muscular action by Hill and Meyerhof. An analysis of its main conclusions will be found in the Croonian Lecture before the Royal Society by Fletcher and Hopkins in 1915 (Proc. Roy. Soc. Lond. 1917, B 89, 444) while critical reviews by A. V. Hill of the relations existing between heat production in muscle and the underlying chemical processes will be found in the Ergeb. d. Phys. 1916, 15, 340 and in Phys. Rev. 1922, 2, 310. Writing in 1923 (Nature, July 14th, Suppl.), A. V. Hill ascribed nearly all the recent advances in muscle physiology to the study of the phenomena of fatigue in muscle. Recovery from fatigue occurred apparently only in the presence of oxygen, while the lactic acid, which was found by Fletcher and

Hopkins to increase by exercise, was diminished or abolished by recovery in the presence of oxygen. Further work on the problem demanded a new technique for correlating the heat produced with the observed chemical phenomena. This was supplied by the delicate thermoelectric apparatus devised by Hill, and by its aid it has been possible to build up what is a completely new chapter in muscle physiology-the thermodynamics of muscular work. The mysterious lactic acid is now known from estimation of the heat evolved in contraction to be derived from glycogen. In recovery the lactic acid is rebuilt into the glycogen from which it was derived except for about one-sixth of it which is oxidised to provide energy for the restoration. The essential point is that contraction and discharge of lactic acid are anaerobic processes and that oxidation is concerned only with the phenomena of recuperation. It has been said that Fletcher's soul was not fuliy and entirely satisfied by the strivings and triumphs of laboratory toil and that he sought a wider arena in which his intellectual versatility and his flair for managing might have full play. Possibly he felt that after 18 years' devotion to one single problem of high physiological importance, he could safely say that he had rounded it off quite satisfactorily according to his lights and that he might now pass on the burden of its further pursuit to workers of other disciplines, biophysics, molecular physics, enzyme chemistry and what not. The call came to him on July 1st, 1914, to take up the duties of Secretary of the Medical Research Committee founded in 1913 as part of the provisions of the National Insurance Act of 1911. From the wide scope of the Committee's reference, and its own views with regard to the extension of the term "Medical Research" as part of a national scheme, it was quite clear that, in the search for the ideal secretary, no ordinary person of narrow views and interests was likely to be successful in guiding its destiny. Fletcher proved himself no ordinary person. This is how the Committee outlined their conception of research. "The object of the research is the extension of new knowledge with the view of increasing our powers of preserving health and preventing or combating disease. But otherwise than that this is to be the guiding aim, the actual field of research is not limited and is to be wide enough to include, so far as may from time to time be found desirable, all researches bearing on health and disease whether or not such researches have any direct or immediate bearing on any particular disease or class of diseases provided that they are judged to be useful in promoting the attainment of the above object." How well Fletcher and his Committee of changing personnel succeeded in translating into administrative practice the wide conception of research contained in this carefully drafted statement and how deftly he defended, when necessity arose, the more subtle and perhaps not too readily appreciated implications of its later phrases, are matters of history. It is the history in fact of a highly fertile period of medical research in this country and the empire, which owes much of its success to Fletcher's gifts of co-ordination and the personal and friendly terms on which he invariably met the numerous workers and grantees in the vast organisation of which he held the threads. This is not the place to record in detail the landmarks of Fletcher's 18 years' secretaryship-the pooling of the forces he wielded, at the very outset of his career, to meet the medical emergencies of war, the happily engineered emergence of the Medical Research Committee as the Medical Research Council with a new Charter and holding office with greater freedom and responsibility under the Privy Council, the centralisation at the National Institute, Hampstead, of

a permanent nucleus of experts in many fields of medical enquiry, and, as the years passed, the numerous opportunities seized by Fletcher to promote his one great ambition, to see the health of man and beast cared for and studied not only as a national and imperial charge but as the natural and fitting obligation of every right-thinking individual. One may fittingly refer here, however, to his many efforts in the cause of biochemical research and pay tribute to his many successful interventions in securing financial help for what are now active centres of research not only in biochemistry but also in nutritional studies. These centres have greatly enriched the resources at the Empire's disposal for attacking effectively the many problems that concern the health of its human and animal populations. Nutrition studies and all that these imply were very dear to Fletcher. Possibly the last reasoned article from his facile pen was a contribution to the new journal, Nutrition Abstracts and Reviews (1932), on the urgency of nutritional studies. There, in commending the new journal to its readers, he referred to the range and variety of interests served by advances in nutritional science and to the fact that no visible limits can be set to them. A perusal of the table of contents of any number of this new journal is indeed sufficient to indicate the far-reaching character of nutrition problems and goes far to establish a real truth underlying the adage "Der Mensch ist was er isst." Fletcher in his role of the complete advocate would have added "and

beast too." By his very position Fletcher could feel the pulse of medical progress at many points and generally with much acumen. So far as biochemical and nutritional science is concerned, its devotees owe him much for the sympathetic and always helpful interest he invariably took in their special problems. Lastly, a glimpse of Fletcher in the midst of his daily office routine, interviewing friends and strangers, arranging committees and often presiding over them, translating draft reports, resolutions and preambles into the excellent English on which he justly prided himself and through it all, striving to secure action and effective action. It has amazed me to watch him preside, it might be, over a conference on poliomyelitis and to see him display his wonderful flair for ordered discussion and his real understanding of the subject in hand. His versatility was not that of the briefed barrister. Truly Fletcher's scientific discipline stood him well. Eighteen annual reports of his Council will inform the medical historian of the future what Fletcher did and what he strove to do to further the work and influence of an organisation which has abundantly justified its national character, but, without their aid, his memory will long remain green in the hearts of those who knew and loved and admired him. 2013-07-08-the-guardian-80-yrs-ago-mrc-researchers-discover-viral-case-of-flu

80 years ago today: MRC researchers discover viral cause of flu

Forget bird flu and swine flu, it was ferret flu and *The Field* magazine that helped MRC scientists discover the influenza virus, after eleven years of dedicated research.

Long term programmes and dedicated researchers: Mr Dennis Busby was one of the youngest recruits to the flu research programme, starting as a lab technician for the NIMR in 1934, aged just 15. Pictured here in 1969, and in 2013 at the MRC's centenary celebrations. Picture courtesy of the Archives of the NIMR at Mill Hill (c) 2013 and Mr Busby.

In the spring of 1933 a team of Medical Research Council (MRC) staff gathered nasal fluids and throat garglings from a sick researcher, filtered them, and dripped them into ferrets. Within forty-eight hours the ferrets would start sneezing and displaying signs of an influenza-like disease. This research formed the basis of an extraordinarily important *Lancet* paper by Wilson Smith, Christopher H Andrewes and Patrick Laidlaw, published on 8 July 1933, identifying a 'virus' as the primary causative agent for influenza. This was no serendipitous finding, but the result of a sustained campaign of funding and research.

The 1918-9 influenza pandemic and virus research

The 1918-19 influenza pandemic challenged ideas about influenza, as at the time most microbiologists believed that influenza was caused by a bacteria. But during the pandemic, pathologists failed to consistently find the bacillus. This undermined claims about its primary role and jeopardised the prospect of producing a vaccine.

Walter Morley Fletcher, Secretary of the MRC, suggested to the War Office and Army Medical Services that attention should be turned to the possible role of a so-called 'filter-passing virus', and in November 1918 the search for the virus began. The first British investigations into the role of a virus in influenza were carried out by two teams in France and within weeks both claimed they had identified a filterable agent from sick servicemen.

These findings were controversial - there was no test for a virus, so its presence had to be inferred: it could not be seen with light microscopes, retained by bacterial filters or studied using culture methods. Only the presence of symptoms, and traces in serological tests suggested any 'thing' was present in infected people (and animals).

In the summer of 1922 Laidlaw was recruited to the MRC's National Institute of Medical Research (NIMR) to develop a project on "diseases probably caused by filter-passing organisms." Although such organisms had been identified as the probable causes of many infectious diseases they had eluded standard laboratory techniques, so new methods had to be developed using 'model' diseases in animals. Canine distemper was selected as the model for influenza, and for over a decade Laidlaw and the resident veterinary pathologist, G. W. Dunkin, used distemper to build virus research at the Institute.

The Distemper Experience

The research attracted some powerful patrons. *The Field*, a country and field sports magazine, already had a Distemper fund to finance work on the disease, and in October 1922 *The Field*'s editor, Sir Theodore Crooke, proposed to Fletcher that the fund should be devoted to supporting Laidlaw and Dunkin.

Advertisement

This money enabled the MRC to develop new laboratories on a forty-acre agricultural site at Mill Hill , which included space to breed and house dogs, as well as a laboratory and isolation/quarantine unit. Until 1924, Laidlaw and Dunkin used puppies bred at Mill Hill to experiment on distemper, but dogs were not ideal experimental animals. Dogs presented an awkwardly variable clinical picture, they were expensive and slow to breed, sometimes hard to handle, and attracted vociferous antivivisection protests. So in late 1924, they introduced the ferret as a new experimental animal, marking the start of a long scientific

attracted vociferous antivivisection protests. So in late 1924, they introduced the ferret as a new experimental animal, marking the start of a long scientific career.

Laidlaw and Dunkin attributed much of their success on distemper to their work with the ferret; they developed an experimental vaccine for ferret distemper in 1926, then modified for dogs in 1927. Burroughs-Wellcome started commercial production in 1928, and by 1931 the vaccine was protecting the nation's dogs. This scientific and commercial success legitimised the NIMR's approach to virus diseases. Its primary goal became virus identification and control through the production of serological assays, therapeutic sera, and vaccines.

New interest in applying this approach to influenza was sparked in 1931, when the American researcher, Richard E. Shope announced that a combination of a bacillus and a filterable virus produced a disease in pigs – 'hog flu' – analogous to human influenza.

Ferret Flu

In late 1932 the MRC decided to concentrate on influenza, placing the research under Laidlaw's control, with experienced virus researchers Smith and Andrewes. At the time, the main obstacle for virus researchers was that they lacked a viable experimental animal to study influenza. Solving this problem was the team's first task.

Through January 1933 they tested nasal and lung material taken from influenza patients on rats, mice, guinea pigs, monkeys, pigs and horses. These efforts failed. They then turned to the ferrets at Mill Hill. **In early February 1933, Smith dripped ("instilled") filtered nasal and throat garglings taken from Andrewes, who had himself caught influenza, into the noses of two ferrets. Unfortunately, before Smith could isolate the virus a distemper out-break destroyed the experiment. By chance, Smith himself caught influenza on 4 March, and this time Andrewes used his throat garglings and his instillation method to infect some ferrets.**

They quickly identified the infecting agent as a virus on the basis that it was filterable, invisible, and not cultivable, but still produced disease in the animal. They named it "W.S." and it became the NIMR's master strain. Through spring 1933, they traced "the full course of [the] illness" in 64 ferrets, noting the analogies of "ferret flu" to human influenza. They were now able to develop a serological test showing that recovered ferrets had antibodies which inhibited the disease, an important piece of evidence in establishing the identity and role of the virus. With this test it was possible to trace neutralising antibodies in sick and healthy Londoners, and thus determine the presence of the virus in the human population. **At the same time, they compared their virus antibodies with those identified by Shope in hog flu,** to show that their virus specifically produced human influenza.

Advertisement

Smith, Andrewes and Laidlaw made a cautious claim in their report to the Lancet that,

> the evidence strongly suggests that there is a virus element in epidemic influenza, and we believe that the virus is of great importance in the aetiology of the human disease.

The report caused a minor media sensation. The Lancet editorialized that it "offered almost conclusive evidence that the primary cause of human influenza is a filterable virus."

Within the year, researchers in other parts of the world confirmed the research. In 1934 mice began to be used in research, followed in 1940 by the developing chick egg, but the ferret and the virus model have become integral to new ways of understanding and controlling influenza. Experimental vaccines were produced in 1936 by Smith, Andrewes and Charles Herbert Stuart-Harris, and in 1947 the NIMR was designated as the World Influenza Centre of the World Health Organization. Work on the 'flu virus also spawned unexpected findings, such as the discovery of Interferon – a protein associated with immune responses – by NIMR researchers Alick Isaacs and Jean Lindenmann in 1957.

The NIMR's success came so quickly only because so much had been put in place in the previous decade. The experience of the 1918-19 pandemic and the MRC's development of virus research created the conditions for the success of 1933. The story is a reminder of the crucial role of the MRC and government-supported research in spurring scientific innovation through sustained funding.

Michael Bresalier is a historian of medicine at Imperial College London. His forthcoming book, "Making Flu: British Medical Science and the Definition of a Virus Disease", will be published by Palgrave. You can read more about his work on influenza and viruses here

- 1st Director of Rockefeller Institute
  - In office 1901–1935
  - Succeeded by Herbert Spencer Gasser
- Lived in (Residence) - New York, NY
- Alma mater University of Louisville
- Awards Cameron Prize of the University of Edinburgh (1911)
- Scientific career
  - Fields : Physician, medical educator, and experimental pathologist
  - Institutions Johns Hopkins University; Rockefeller Institute; Oxford University (UK)
  - Doctoral students John D. Rockefeller, Jr.

Simon Flexner, M.D. ForMemRS[1] (March 25, 1863 in Louisville, Kentucky – May 2, 1946) was a physician, scientist, administrator, and professor of experimental pathology at the University of Pennsylvania (1899–1903). He served as the first director of the Rockefeller Institute for Medical Research (1901–1935) (later developed as Rockefeller University) and a trustee of the Rockefeller Foundation. He was also a friend and adviser to John D. Rockefeller Jr..

Among Flexner's most important achievements are studies into poliomyelitis and the development of serum treatment for meningitis. Among his lab assistants were Hideyo Noguchi and Cornelius Rhoads, later directors of Memorial Hospital and the Sloan-Kettering Institute, respectively.

The bacteria species Shigella flexneri was named in recognition of Flexner.[2][3] In addition, Flexner was the first to describe Flexner-Wintersteiner rosettes, a characteristic finding in retinoblastoma, a type of cancer.

Early life and career

Simon was born in Louisville, Kentucky, to Moritz (Morris) Flexner, an immigrant from Neumark, Bohemia, via several years in Strasbourg, France; and Esther from Roden, Germany. He was the fourth son of seven in a large family of nine children: Jacob Flexner, Henry, and Isadore; then Simon, followed by Bernard Flexner, Abraham Flexner, and Washington. The two sisters Mary and Gertrude were the youngest. Jacob became a pharmacist and physician; Bernard became a Zionist leader, and Abraham became an educator, eventually influencing the direction of medical education in the United States.[4]

Simon first gained a degree from the Louisville College of Pharmacy and worked with his brother Jacob for eight years.[4]

Medical school and career

He returned to college, getting his medical degree from Louisville Medical College in 1889. He did postgraduate work in pathology at Johns Hopkins University Medical School, and started teaching there. By 1899, he was a professor of pathology at the University of Pennsylvania.[4]

Flexner was elected to the American Philosophical Society in 1901.[5]

He taught at Penn until 1903, but was called to the Rockefeller Institute for Medical Research (later Rockefeller University), where he started serving as its first director in 1901.[6] He managed the research institute until 1935. Through this affiliation and related work, he came to know the philanthropist John D. Rockefeller, who supported research and basic medical care.

In December 1907 Flexner declared in a reading of his paper on "Tendencies in Pathology" in the University of Chicago that it would be possible in the then-future for diseased human organs substitution for healthy ones by surgery—including arteries, stomach, kidneys and heart.[7] These previsions became reality in the second half of the 20th century.

The institute had a long relationship with the government of Puerto Rico, conducting research and working on health issues there, such as anemia (caused by hookworm and tropical sprue), as well as polio and a variety of diseases.[citation needed]

In 1911, Flexner was awarded the Cameron Prize for Therapeutics of the University of Edinburgh.

Marriage and family

Simon Flexner married Helen Thomas (later professor of English) and had a family. His son James Thomas Flexner became a prolific writer; one of his works was an extensive biography of George Washington.

Dr. Flexner died in May 1946 in New York City, from a myocardial infarction (heart attack). He was 83 years old. His papers are currently housed at the American Philosophical Society[8] and the Becker Medical Library at the Washington University School of Medicine.[9]

Dr. Flexner's Experiment

When Simon Flexner retired in 1935 as the first director of The Rockefeller Institute for Medical Research, his colleagues wanted to organize a testimonial in his honor. But Flexner, in keeping with his characteristic reserve, politely declined. He had been director for thirty-three years, during which time the Institute had grown from a handful of scientists working in rented quarters to a world-renowned research center. As he passed through its gates for the last time, he left behind, on its library shelves, the most durable and eloquent tribute to his career: one hundred bound volumes containing the reports of the scientists whose research he had guided, encouraged, and nurtured.

Within the pages of the volumes were his own considerable contributions to the understanding of meningitis and polio, Hideyo Noguchi's studies of syphilis, Peyton Rous's demonstrations of virus-caused cancer, Karl Landsteiner's discovery of the Rh factor, Eugene Opie's descriptions of the process of inflammation, and the research on pneumonia that culminated in Oswald Avery's identification of DNA as the material of the genes.

With this issue, *Research Profiles* introduces what will be an occasional glance backward at the history of The Rockefeller Institute for Medical Research, now The Rockefeller University, as exemplified by some of its most remarkable figures. We begin, appropriately, with Simon Flexner.

When Simon Flexner retired in 1935 as the first director of The Rockefeller Institute for Medical Research, his colleagues wanted to organize a testimonial in his honor. But Flexner, in keeping with his characteristic reserve, politely declined. He had been director for thirty-three years, during which time the Institute had grown from a handful of scientists working in rented quarters to a world-renowned research center. As he passed through its gates for rhe last time,· he left behind, on its library shelves, the most durable and eloquent tribute to his career: one hundred bound volumes containing the reports of the scientists whose research he had guided, encouraged, and nurtured.

Within the pages of the volumes were his own considerable contributions to the understanding of meningitis and polio, Hideyo Noguchi's studies of syphilis, Peyton Rous's demonstrations of virus-caused cancer, Karl Landsteiner's discovery of the Rh factor, Eugene Opie's descriptions of the process of inflammation, and the research on pneumonia that culminated in Oswald Avery's identification of DNA as the material of the genes.

With this issue, Research Profiles introduces what will be an occasional glance backward at the history of The Rockefeller Institute for Medical Research, now The Rockefeller University, as exemplified by some of its most remarkable figures. We begin, appropriately, with Simon Flexner.

"AM I THE MAN FOR THE PLACE?"

The idea for an institute for medical research was first proposed to oil magnate John D. Rockefeller by his confidential advisor, Frederick T. Gates. During his early years as a clergyman, visiting the sick and dying, Gates had had ample opportunity to see at first hand how ineffective was the medicine of the time. By the late nineteenth century, with the discovery that microbes cause infectious disease, a true medical science was beginning to emerge in such places as the Pasteur Institute, in Paris, and the Koch Institute, in Berlin. No such institutes existed in the United States. **Gates's vision of an American institute comparable to the great research centers of Europe was shared by John D. Rockefeller, Jr., who was instrumental in organizing The Rockefeller Institute's first board of directors and acted as an intermediary between the board and his father.**

The first choice for the position of director was not Simon Flexner but the distinguished animal pathologist Theobald Smith. To no one's great surprise, Smith declined to leave his post at Harvard. When the board approached Flexner, he, too, was not sure he wanted the job. Two years earlier, he had been appointed director of pathology at the University of Pennsylvania School of Medicine. At the age of thirty-eight, he was on the faculty of the nation's oldest medical school in the most prestigious position a pathologist could hope for. Also, he was skeptical as to whether the proposed institute could be successfully established with a benefactor who was proceeding so cautiously it seemed his support might vanish at any moment.

Flexner had doubts as well about his own competence to lead such an endeavor. For within the mind of the accomplished scientist lingered memories of the unpromising boy he had been growing up in Louisville, Kentucky. (When he was ten, his delinquency so worried his parents that his father, an immigrant Jewish peddler, arranged a private tour of the town jail as a warning to his son of where he would end up if he did not change his ways.) He had dropped out of school in the eighth grade, and until he fell victim, at sixteen, to typhoid fever, he had drifted from one menial job to another.

His nearly fatal illness and long convalescence transformed the indolent adolescent. As he himself expressed it, "I appear to have become wide awake almost at once." From a job as a drugstore apprentice he went on to earn a degree, with highest grades, at the Louisville College of Pharmacy and was soon sharing ownership of a drugstore with one of his brothers.

Greater achievements followed, but he never completely conquered his early sense of inadequacy. All his life he remained shy and reticent, unsure of his capabilities. Writing to a friend for advice as to whether or not to take the Rockefeller post, he wondered, ':Am I the man for the place? Have I the originality to keep it going?"

Also in need of assurances was the man being asked to bankroll this experiment in scientific philanthropy. An institute devoted entirely to laboratory science

Also in need of assurances was the man being asked to bankroll this experiment in scientific philanthropy. An institute devoted entirely to laboratory science was, after all, an unproven concept in the United States, regarded even by members of the medical establishment with suspicion. At that point, Rockefeller was prepared to give twenty thousand dollars a year for ten years, a sum just enough for the board to begin moving ahead by small steps.

The first question the board pondered was whether there were enough able scientists to fill an institute. To find out, they provided funds to support young researchers working in existing medical school laboratories. The papers that followed convinced them there was no lack of talent.

Since Rockefeller had asserted that his primary interest in research was humanitarian rather than scientific, the board also allotted part of the first year's budget to an immediate medical problem. Infant illness and death from dysentery were widespread in New York, as in other large cities. Researchers enlisted by the Institute began an investigation that quickly demonstrated an alarmingly high level of bacterial contamination in the milk sold from open cans to tenement dwellers. Before the study was officially submitted, the Board of Health had issued rigorous new regulations for milk inspection and the dysentery epidemics in New York halted.

The practical value of medical research had been demonstrated, as well as the existence of sufficient expertise to carry it forward. But what finally decided the matter was news that rival industrialist Andrew Carnegie was planning his own philanthropic enterprise. On June 13, 1902, John D. Rockefeller donated one million dollars to The Rockefeller Institute for Medical Research. The next day, Simon Flexner accepted its directorship.

"GIVE THEM PERFECT FREEDOM"

Since his formal employment was not to start until the following year, Flexner used the intervening months to visit research institutes in Europe and meet .with prominent scientists in order to clarify his ideas. It was from Anton Dohrn of the Naples Zoological Society that he received the most pointed advice. "Men work here in a dozen different branches of biological science," Dohrn told him. "Can I be an authority on them all? No, no. Give them perfect freedom. Let them search where and how they will. Help in every way you can, but. do not pretend to be master of them.... Unless you permit workers in the medical institute to make perfect fools of themselves," he warned Flexner, "you will make no great discoveries."

It was a point of view consonant with Flexner's own development. Tending the pharmacy in Louisville, he had taught himself to use a microscope, and without books or teacher, with only tissue specimens given him by local doCtors, had mastered the basics of histology and pathology. His self-directed approach changed little when he entered the scientific community.

In 1893, the Johns Hopkins University, in Baltimore, had established a medical school with research laboratories that quickly become famous as a proving ground for young physicians interested in pursuing medicine as a science. The teaching staff, as Flexner learned, placed strong emphasis on independent investigation. It seemed to him the ideal place to expand his knowledge. But to become eligible to study pathology at Hopkins, he needed an M.D. degree.

Such a requirement was easier to fulfill then than now. Medical schools in those days were by and large spurious affairs, little more than trade schools in which instruction typically consisted of rote lectures delivered by practitioners turned part-time "professors" in return for a share of the students' fees. (It was this system of medical education that Simon's brother Abraham was to criticize harshly in the now famous "Flexner Report" of 1910. The impact of the report closed hundreds of medical schools and impelled those that remained to upgrade their methods.) **Simon Flexner received a medical degree in Louisville without ever having performed a physical examination.**

In September of 1890, with five hundred dollars lent him by his brother Abraham, he arrived in Baltimore.

The pathology department at Hopkins was headed by [Dr. William Henry Welch (born 1850)], whose idiosyncratic and freewheeling style suited Flexner perfectly. After brief lectures, the students were given tissue sections to stain, mount, and study. Welch moved among them, sometimes discussing what they were seeing under the microscope, but for the most part leaving them to puzzle out problems for themselves. The result was a harvest of original research, including a major finding by Flexner.

The lecture topic of the day had been diphtheria. Dr. William Henry Welch (born 1850)] had explained that Friedrich Loeffler, the discoverer of the diphtheria bacillus, had been unable to confirm a report of diphtheria lesions in lymphoid glands. After the lecture, Flexner decided to try the experiment on his own. Obtaining an infected guinea pig, he removed the lymphoid glands, took a cutting, and mounted it. As he turned the knobs of the microscope, the image sharpened. With a shock of surprise, he saw the lesions.

The significance of this, his first major discovery, was twofold: it confirmed Loeffler's bacillus, which had been under dispute for years, and it solved a controversy concerning whether the disease was local or constitutional in origin. (Flexner showed that the bacilli proliferated only at the point of infection and then produced a poison that passed into the body.) Flexner became Welch's favorite student, and when a position became available as Welch's assistant, he got the job.

Although Flexner often commented that he had consciously modeled himself after Dr. William Henry Welch (born 1850)], the two men could not have been more different. Flexner was punctilious to details; Welch's rooms were cluttered with books, papers, and unread manuscripts. Flexner was self-contained, soft-spoken, and slightly built; Welch was rotund, gregarious, fond of cheap cigars, amusement park rides, and baseball. A Baltimore Orioles fan, he could be found regularly at the ballpark on summer afternoons correcting proofs of The Journal of Experimental Medicine between innings. Their differences notwithstanding, the two men, working together, redirected pathology training at Hopkins from the traditional style of reading, listening, and memorizing to that of seeing and doing. Welch served on the board of scientific advisors of The Rockefeller Institute for thirty-two years.

FINDING THE BEST

The initial staff Flexner recruited for The Rockefeller Institute for Medical Research began work in 1904 in a converted three-storey apartment building on Lexington Avenue and 50th Street in Manhattan. Until the Institute could prove itself, established investigators and those with promise could not be expected to be easily wooed from university positions. Flexner's mission was to convince them to take a chance on the future of the fledgling institution.

Samuel Meltzer was one of the men Flexner doubted would accept his invitation. At fifty-three, Meltzer had long before distinguished himself as a pathologist in his native Germany. Because, as a Jew, he could not hope for a university chair there, he had come to New York and had been supporting his research with a medical practice. Flexner could offer only a half-time job. Meltzer responded, "I have always paid laboratories to be permitted to work in them; now you propose to pay me to work. Of course I will come."

The group was soon joined by Phoebus Aaron Theodor Levene, a Russian-born chemist who had studied in the prestigious laboratory of Emil Fischer in Berlin. Flexner showed courage in taking him on, for Levene had recently spent more than two years nursing a tubercular lung. -

Flexner also invited his former protege from the University of Pennsylvania, [Dr. Hideyo Noguchi (born 1876)]. A rice farmer's son from Japan, Noguchi

had put himself through medical school and in 1899 traveled halfway across the world to present himself, with twenty dollars in his pocket, on the doorstep of "the great Dr. Flexner." **Under Flexner's guidance, Noguchi became a master microbiologist and pathologist.** Among his achievements, he was the first to demonstrate that paresis resulted from syphilis and to grow pure cultures of the syphilis spirochetes. (At Pennsylvania, he had begun studies on the effects of snake venom on red blood cells. He continued these investigations at Rockefeller, keeping live rattlers in dry-goods boxes to the consternation of his colleagues and the delight of newspaper reporters.)

His dream was to conquer yellow fever. The agent of yellow fever is a virus, and very little was then understood about viruses. In 1928, he died of the disease, contracted in Africa', where he had journeyed at the height of an epidemic, still hoping to solve its mystery. By the time of his death, he had attained world recognition. In his native country, half a century later, his name retains its heroic stature and The Rockefeller a special esteem.

In pursuit of the best, Flexner recognized no boundary of race, religion, nationality, or sex, not a policy common to all institutions in those days. And he selected his staff to represent the broadest base of scientific inquiry, making no attempt to fashion the Institute after his own particular interests. Nor did he press for immediate results. But while publicly asserting that "there is no royal road to discovery," privately he harbored doubts. "The first years," he later confessed, "were nervous ones for all concerned." He felt pressed to deliver himself some important and highly visible result.

The opportunity soon presented itself in the form of an epidemic of cerebrospinal meningitis that struck New York in 1904. Before it was done, it had claimed three thousand lives. Flexner had studied the disease at Hopkins and was well-acquainted with the bacterium that inflamed the brain and spinal cord membranes of its victims. He took up the challenge again.

Investigators in Europe and at the Board of Health laboratories in New York had developed a serum that raised antibodies to the bacterium but failed to stop the course of the disease. Flexner struggled with the problem without success until he was inspired to try a novel mode of inoculation.

Instead of injeCting the serum under the skin, which was the usual procedure, he injected it directly into the spinal canal at the site of inflamed membranes. After successful trials with laboratory animals, this method was used with human patients during a meningitis outbreak in Ohio in 1907. Of those thus treated, three in four survived, as opposed to one in four in previous epidemics.

For a number of years, Flexner personally supervised the manufacture of the Flexner serum, as it came to be known. In one twelve-month period the Institute distributed seven thousand bottles. Although results were not always as impressive as in Ohio, the serum remained the only means for reducing deaths from meningitis until the advent of antibiotics.

During those years, Flexner also conducted some of the earliest studies of polio, discovering, among other things, its viral origins and its mode of transmission. His work provided what Jonas Salk later called the "conceptual framework" for the development of polio vaccines.

In 1906, The Rockefeller Institute moved to its permanent home on York Avenue and 66th Street. In 1910, it opened the first hospital in the country devoted solely to clinical research. At the Rockefeller Hospital, long before his DNA discovery, Oswald Avery explored the mechanisms of pneumonic infection and developed the first effeCtive treatment for it, and Rebecca Lancefield classified the bacteria responsible for human streptococcal infection. A laboratory of animal and plant pathology was established in 1914, in Princeton, New Jersey, where, John Northrop and Wendell Stanley conducted enzyme research that led to a Nobel Prize in 1946.

During the First World War, the Institute ran a War Demonstration Hospital on its grounds to teach surgical methods to medical officers. Among its instructors was Alexis Carrel, whose surgical innovations had won him, in 1912, the first Nobel Prize in Medicine awarded in the United States and the first of the nineteen Nobel Prizes that would come to scientists associated with The Rockefeller. During this period, Peyton Rous, who would receive a Nobel Prize in 1966 for his discovery of a cancer virus, developed a method for preserving whole blood for use in transfusion, a vitally important technique for military medicine.

If Flexner found the task of choosing a staff "a difficult and often dubious and baffling undertaking," others were often baffled by his choices. Board member Theobald Smith questioned the appointment of the German physiologist Jacques Loeb. What, Smith asked, did physical chemistry have to do with curing disease? But Loeb, whose demonstration of chemically induced parthenogenesis in sea urchins and frogs had astonished the scientific world, believed that physical chemistry would eventually explain all biological phenomena. The so-called mechanistic theory of life was his religion and he preached it in laboratory and lunchroom.

At the other end of the spectrum, the Frenchman Carrel, ardent Catholic and mystic, who claimed to have had a heavenly vision at Lourdes, tried the director's devotion to "perfect freedom" in other ways. Beyond creating his own miracles of technique, from the suturing of minute blood vessels to new methods for cell and organ cultivation, Carrel's imagination led him in many directions. Observing that cancer rates varied widely from one geographical area to another, he hypothesized that diet played a role, a notion considerably ahead of its time. To test it, he convinced Flexner to build him a "mousery," a huge glass-roofed, air-conditioned labyrinth on the top floor of the Institute's powerhouse. At its peak population, it housed fifty-five thousand mice. The mousery ended in mystery, its appropriations terminated without explanation, Carrel's voluminous records undecipherable. As Dorhn had foreseen, freedom was a philosophy that necessarily combined spectacular success with frequent failure.

THE MAP OF TIME

Simon Flexner achieved the hope he had expressed early in his tenure of putting the work of The Rockefeller Institute on "the map of time." His special genius resided in his respect for individuality and his understanding of the scientific temperament. Juggling administrative minutiae and budget ledgers, he was always sensitive to how demanding, lonely, and heartbreaking the research life could be. Over thirty-three years, more than one scientist would emerge from the director's office strengthened against despair. "I did not think yesterday morning my nerves could stand the strain much longer," Phoebus Levene wrote to Flexner. "I left your room after our little interview cured and happy."

"Such men," Flexner observed, "when numerously assembled under one roof, may give rise to situations which tax somewhat the administrative staff; but it appears nevertheless that with the high purpose mutually understood and appreciated and the exercise of a fair amount of human wisdom and tact, such a temperamental team is capable of working in close contact and with mutual respect and helpfulness."

Once, in a letter to his future wife, Flexner wrote about a day in the laboratory when a number of his group were "working merrily" and of how he "caught the spirit and puttered among some embers of studies." Suddenly, he observed something through the microscope he had not seen before. "Nature is a tantalizing mistress," the letter concludes, "and gives her fruits only at particular seasons, when the spirit is on her-and you."

The cultivation of that spirit, which continues to guide the work of The Rockefeller University, was Dr. Flexner's greatest experiment and his legacy to science.

science.

BERNARD FLEXNER, JEWISH LEADER, 80

First President of Palestine Economic Corporation Dies—Social Welfare Figure

Bernard Flexner, who played a leading role in the development of Palestine as an organizer and was the first president of the Palestine Economic Corporation, died early yesterday after a brief illness at the Harkness Pavilion of the Columbia-Presbyterian Medical Center. He was 80 years old.

Mr. Flexner, who resided at 1000 Park Avenue with his sister, Miss Mary Flexner, was elected president of the Palestine Economic Corporation when it was organized in 1925, and later became chairman of its board of directors.

He held this office until last year, when he requested that a younger man undertake the planning of a post-war program. He was then elected chairman emeritus and Robert Szold became chairman of the board.

Surviving Mr. Flexner also are another sister, Mrs. Julius L. Baldauf, and two brothers, Dr. Simon Flexner, formerly of the Rockefeller Institute for Medical Research, and Dr. Abraham Flexner, formerly director of the Institute for Advanced Study at Princeton University.

One of Three Famous Brothers

Mr. Flexner was one of three distinguished sons of Morris Flexner and the former Esther Abraham, and was born in Louisville, Ky., on Feb. 24, 1865.

He attended Louisville public schools, received a Bachelor of Laws degree at the University of Louisville, studied subsequently in the Law Department of the University of Virginia and was admitted to the bar in Kentucky in 1898. In practice since then, he moved to Chicago in 1911 and to this city eight years later.

BERNARD FLEXNER
© Bachrach

His first post in social welfare was as chairman of the Juvenile Court Board of Jefferson County (Louisville), which he held from 1906 to 1911. Three years later he was appointed by the United States Attorney General to head a special committee to study the need for legislation affecting children in the District of Columbia.

Before and during the World War Mr. Flexner served on the Kentucky Board of Tuberculosis Commissioners and was a member of the American Red Cross Commission to Rumania in July, 1917. At the Paris Peace Conference he was counsel to the Zionist delegation.

While serving with the Red Cross in Rumania and Poland, Mr. Flexner became convinced that resettlement in Palestine provided the best solution for the Jewish people. He learned of the Balfour Declaration on Palestine when returning to America by way of Siberia, and when he settled in Chicago he became active in the Zionist Organization of America. In 1920 he accompanied the late Supreme Court Justice Louis D. Brandeis to the World Zionist Conference in London.

Organized Palestine Corporation

His interest in the condition of post-war Jewry occupied Mr. Flexner extensively. In 1925 he organized the Palestine Economic Corporation, the group with which he was most closely associated in Jewish affairs. Shortly after the group came into existence the American Palestine Company was merged with it, transferring to the new body more than $1,000,000 worth of subscriptions. Associated with Mr. Flexner in this major project to extend credits and in other ways to promote industry and commerce in Palestine were Felix M. Warburg, Louis Marshall and Herbert H. Lehman.

Mr. Flexner was president of the corporation until 1931. One of the organization's major activities early in its career was the financing of the hydroelectric station on the Jordan River and of the transmission lines to power stations at Tel Aviv, Haifa and Tiberias.

In 1928 Mr. Flexner founded the Abraham Flexner Lectureship in Medicine at Vanderbilt University and the Mary Flexner Lectureship on Humanities at Bryn Mawr College. The latter was in honor of his sister, a graduate of Bryn Mawr.

Aided Studies of Juvenile Courts

Mr. Flexner continued to be known primarily as a lawyer and as head of the Palestine Economic Corporation, but his interest in juvenile welfare never flagged. He had collaborated on studies of juvenile courts with R. N. Baldwin and Reuben Oppenheimer and, in 1929, with the latter and Katharine F. Lenroot of the Federal Children's Bureau, he prepared a report urging domestic relations clinics staffed by psychologists, psychiatrists and social investigators.

Late in 1930 Mr. Flexner was appointed, with Dr. Cyrus Adler, Morris Rothenberg and Robert Szold, to a provisional committee of four to act on behalf of American members of the Jewish Agency for Palestine, as a result of the resignation of Mr. Warburg as chairman of the agency's administrative committee. Three years later he was chosen vice president of the American Joint Reconstruction Foundation, succeeding Governor Lehman.

In 1933 he joined in the work of the Emergency Committee in Aid of Displaced German Scholars, serving as a member of the group's executive committee. Two years later, with the formation of the $10,000,000 Refugee Economic Corporation, headed by Mr. Warburg, Mr. Flexner was named secretary.

Bernard Flexner (1865–1945), a New York lawyer, was a prominent member of the Zionist Organization of America.

Flexner was born in Louisville, Kentucky to a family that immigrated from Europe in the early 1860s. He studied law in the University of Louisville and the University of Virginia. He was admitted to the Kentucky bar in 1898. He practiced law until 1914, when he became active in public activity. He was chair of a Juvenile court board in Louisville and in 1917 participated in a Red cross delegation to Romania. He served as counsel for the Zionist delegation to the Paris Peace Conference (1918–1919) and in 1925 he was one of the founders of the Palestine Economic Corporation (PEC). He served as president of PEC until 1931 and afterwards was chairman of the director council of the PEC.[1]

He was one of the founders of the Council on Foreign Relations.

His papers are held in the Seeley G. Mudd Manuscript Library at Princeton University.

Abraham Flexner (November 13, 1866 – September 21, 1959) was an American educator, best known for his role in the 20th century reform of medical and higher education in the United States and Canada.[1]

After founding and directing a college-preparatory school in his hometown of Louisville, Kentucky, Flexner published a critical assessment of the state of the American educational system in 1908 titled The American College: A Criticism. His work attracted the Carnegie Foundation to commission an in-depth evaluation into 155 medical schools in the US and Canada.[2] It was his resultant self-titled Flexner Report, published in 1910, that sparked the reform of medical education in the United States and Canada.[1] Flexner was also a founder of the Institute for Advanced Study in Princeton, which brought together some of the greatest minds in history to collaborate on intellectual discovery and research.[2]

Biography

Early life and education

Flexner was born in Louisville, Kentucky on November 13, 1866. He was the sixth of nine children born to German Jewish immigrants, Ester and Moritz Flexner.[3] He was the first in his family to complete high school and go on to college.[2] In 1886, at age 19, Flexner completed a B.A. in classics at Johns Hopkins University, where he studied for only two years. In 1905, he pursued graduate studies in psychology at Harvard University, and at the University of Berlin.[4] He did not, however, complete work on an advanced degree at either institution.

Personal life

Flexner had three brothers named Jacob, Bernard and Simon Flexner. He also had a sister named Rachel Flexner.[5]

The success of Abraham Flexner's experimental schooling allowed him to help finance Simon Flexner's medical education at Johns Hopkins School of Medicine. He proceeded to become a pathologist, bacteriologist and a medical researcher employed by the Rockefeller Institute for Medical Research from 1901 to 1935.[5]

Flexner circa 1895

Flexner also financed his sister's undergraduate studies at Bryn Mawr College. Jacob ran a drugstore and used the profits from selling the establishment to attend medical school. He then practiced as a physician in Louisville. Bernard pursued a career in law and later practiced in both Chicago and New York.[5]

In 1896, Flexner married a former student of his school, Anne Laziere Crawford. She was a teacher who soon became a successful playwright and children's author. The success of her play Mrs. Wiggs of the Cabbage Patch (based on the 1901 novel) funded Flexner's studies at Harvard and his year abroad at European universities. The couple had two daughters Jean and Eleanor. Jean went on to become one of the original employees of the United States Division of Labor Standards. Eleanor Flexner became an independent scholar and pioneer of women's studies.[5]

Flexner grew up in an Orthodox Jewish family, however, early on he became a religious agnostic.[2]

In addition to contributions by his brother Simon, their nephew, Louis Barkhouse Flexner, was founding director of the Mahoney Institute of Neurological Sciences at the University of Pennsylvania and a former editor of the Proceedings of the National Academy of Sciences.[citation needed]

Death

Flexner died in Falls Church, Virginia, in 1959 at 92 years of age. He was buried in Cave Hill Cemetery in Louisville, Kentucky.[5]

Career

Experimental schooling

After graduating from Johns Hopkins University in two years with a degree in classics, Flexner returned to Louisville to teach classics at Louisville Male High School. Four years later, Flexner founded a private school in which he would test his growing ideas about education. Flexner opposed the standard model of education that focused on mental discipline and a rigid structure. Moreover, "Mr. Flexner's School" did not give out traditional grades, used no standard curriculum, refused to impose examinations on students, and kept no academic record of students. Instead, it promoted small learning groups, individual development, and a more hands-on approach to education. Graduates of his school were soon accepted at leading colleges, and his teaching style began to attract considerable attention.[2]

The American College

In 1908, Flexner published his first book, The American College. Strongly critical of many aspects of American higher education, it denounced, in particular, the university lecture as a method of instruction. According to Flexner, lectures enabled colleges to "handle cheaply by wholesale a large body of students that would be otherwise unmanageable and thus give the lecturer time for research." In addition, Flexner was concerned about the chaotic condition of the undergraduate curriculum and the influence of the research culture of the university. Neither contributed to the mission of the college to address the whole person. He feared that "research had largely appropriated the resources of the college, substituting the methods and interest of highly specialized investigation for the larger objects of college teaching."[6]

His book attracted the attention of Henry Pritchett, president of the Carnegie Foundation, who was looking for someone to lead a series of studies of professional education. The book consistently cited Pritchett in discussions of views on educational reform, and the two soon arranged to meet through the then-president of Johns Hopkins University, Ira Remsen. Although Flexner had never set foot inside a medical school, he was Pritchett's first choice to lead a study of American medical education, and soon joined the research staff at the Carnegie Foundation in 1908. Although not a physician himself, Flexner was selected by Pritchett for his writing ability and his disdain for traditional education.[2]

Flexner Report

Main article: Flexner Report

In 1910, Flexner published the Flexner Report, which examined the state of American medical education and led to far-reaching reform in the training of doctors. The Flexner Report led to the closure of most rural medical schools and all but two African-American medical colleges in the United States, given his adherence to germ theory, in which he argued that if not properly trained and treated, African-Americans and the poor posed a health threat to middle/upper class European-Americans.[7] His position was:

The practice of the Negro doctor will be limited to his own race, which in its turn will be cared for better by good Negro physicians than by poor white ones. But the physical well-being of the Negro is not only of moment to the Negro himself. Ten million of them live in close contact with sixty million whites. Not only does the Negro himself suffer from hookworm and tuberculosis; he communicates them to his white neighbors, precisely as the ignorant and unfortunate white contaminates him. Self-protection not less than humanity offers weighty counsel in this matter; self-interest seconds philanthropy. The Negro must be educated not only for his sake, but for ours. He is, as far as the human eye can see, a permanent factor in the nation.[8]

Ironically, one of the schools, Louisville National Medical College, was located in Flexner's hometown. In response to the report, some schools fired senior faculty members in a process of reform and renewal.[9]

Influence on Europe

Flexner soon conducted a related study of medical education in Europe.[10] According to Bonner (2002), Flexner's work came to be "nearly as well known in Europe as in America."[2] With funding from the Rockefeller Foundation, Flexner "...exerted a decisive influence on the course of medical training and left an enduring mark on some of the nation's most renowned schools of medicine."[2] Bonner worried that "the imposition of rigid standards by accrediting groups was making the medical curriculum a monstrosity," with medical students moving through it with "little time to stop, read, work or think." Bonner (2002) calls Flexner "the severest critic and the best friend American medicine ever had."[2]

New Lincoln School

Between 1912 and 1925, Flexner served on the Rockefeller Foundation's General Education Board, and after 1917 was its secretary. With the help of the board, he founded another experimental school, the Lincoln School, which opened in 1917, in cooperation with the faculty at Teachers College of Columbia University.[citation needed]

Institute for Advanced Study

Main article: Institute for Advanced Study

left to right: Albert Einstein, Abraham Flexner, John R. Hardin, and Herbert Maass at the Institute for Advanced Study on May 22, 1939

The Bambergers, heirs to a department store fortune, were set on creating a medical school in Newark, New Jersey that gave admissions preference to Jewish applicants in an effort to fight the rampant prejudice against Jews in the medical profession at that time. Flexner informed them that a teaching hospital and other faculties required a successful school. A few months later, in June 1930, he had persuaded the Bamberger siblings and their representatives to fund instead the development of an Institute for Advanced Study.[5]

The Institute was headed by Flexner from 1930 to 1939 and it possessed a renowned faculty including Kurt Gödel and John von Neumann.

During his time there, Flexner helped bring over many European scientists who would likely have suffered persecution by the rising Nazi government. This included Albert Einstein, who arrived at the Institute in 1933 under Flexner's directorship.[11]

Universities: American, English, German

In his 1930 Universities: American, English, German,[12] Flexner returned to his earlier interest in the direction and purpose of the American university, attacking distractions from serious learning, such as intercollegiate athletics, student government, and other student activities.

Legacy

- The Flexner Report and his work in education has had a lasting impact on medical and higher education. The specific impacts of the Flexner Report on American and Canadian medicine include:
  - Average physician quality has increased significantly[13]
  - Medicine has become a lucrative and well-respected profession
  - A physician must receive at minimum six years, preferably eight years of post-secondary education, typically in a university setting
  - Medical education is based on research, specifically in the fields of human physiology and biochemistry
  - Medical research follows the same protocols as scientific research[14]
  - The state government must approve the founding of any medical school and medical schools are subject to state regulation
  - The state branches of the American Medical Association oversee all the conventional medical schools in each state
- The Institute for Advanced Study, which Flexner co-founded, has been conducting valuable research for over 80 years in attempt to understand the complexities of the physical world and humanity

Honors

- The Association of American Medical Colleges created the Abraham Flexner Award for Distinguished Service to Medical Education to annually recognize individuals who have made a notable contribution to American medical education.[15] In 2020, "in light of racist and sexist writings" the AAMC renamed the award, removing Flexner's name.[16]
- The University of Kentucky College of Medicine created the Abraham Flexner Master Educator Awards to recognize achievement in six categories:
  - Educational Leadership and Administration
  - Outstanding Teaching Contribution or Mentorship
  - Educational Innovation and Curriculum Development
  - Educational Evaluation and Research
  - Faculty Development in Education[17]
- Abraham Flexner Way in downtown Louisville's hospital district was named by the Louisville Board of Aldermen in November 1978 to honor Flexner.

QUINCY FORTIER M.D. **Quincy E. Fortier, M.D**. passed away Saturday, Nov. 11, 2006, at the age of 94. Born Sept. 16, 1912, Quincy practiced medicine for over 60 years in Nevada. Quincy spent his childhood in Shrewsbury, Mass., and moved on to higher education at Dartmouth University in South Dakota. Following his calling in medicine, he later received his M.D. from the University of Minnesota. Quincy built and operated a small hospital in Pioche and from there moved to Reno to become the resident physician at the University of Nevada Reno. He later relocated to Las Vegas and opened his first office to practice general medicine. Eventually he chose to specialize in Obstetrics and Gynecology, returned to the University of Minnesota, and received his Board Certification. After being directed by the State of Nevada to report to the U.S. Army, Quincy instead enlisted in the U.S. Air Force with a rank of captain. His chosen assignment was to Ramey A.F. Base, Puerto Rico, where he became a flight surgeon, assistant hospital base commander, and head of the OBGYN department. It was a high point in his life. Three and a half years later, his service completed, he returned to Las Vegas with his family to continue his medical practice. He was promoted to rank of full colonel and as acting commander of the Reserve Unit at Nellis Air Force Base Hospital. Later, though declining the promotion to rank of general, he remained dedicated to the U.S. Air Force and a loyal patriot. In the 1960's, Quincy built and co-owned Women's Hospital, fulfilling his wish for a hospital dedicated solely to women. A Master Mason of the St. John Lodge of Freemasons in Pioche, his longstanding service to the community included actively supporting many charities such as the YMCA and Camp Fire Girls. Known as 'Doc' to many, Quincy dedicated his life to education and helping others. As a member of Christ Church Episcopal, he served on the Vestry and was a licensed lay reader. He was honored for his endeavors on behalf of Faith Lutheran School and was named Doctor of the Year (1991) by the Clark County Medical Society. Quincy is survived by his sister, Christine Johnson of Yucca, Calif.; and by his children, Connie West (Mike) of Tacoma, Wash., Renee Fortier, Kathleen Frosini of Las Vegas, Annette Whittemore (Harvey) of Reno, Quincy Jr., Dana, Nannette and Sonia Fortier of Las Vegas. He is grandfather to 15 and great-grandfather to four. A celebration of life and the burial of the dead will be at 1 p.m. Saturday, Nov. 18, at Christ Church Episcopal, 2000 S. Maryland Parkway. Donations may be made to Christ Church Episcopal, The Boys and Girls Club of Nevada, YMCA, or the Alzheimer's Association.

After his death last year, Dr. Quincy Fortier confirmed the fraud he never had to admit during a long, decorated career in Las Vegas.

The obstetrician, who opened Las Vegas' first women's hospital and was named 1991 Doctor of the Year, was accused years later in lawsuits of fraudulently using his own sperm to artificially inseminate two patients.

Each claimed the doctor told her he was using her husband's sperm, and each gave birth to two children about 20 years before they learned the truth about their children's paternity.

In each case, confidential, out-of-court settlements were reached, in 2001 and 2006 respectively, after court-ordered DNA tests showed Fortier was the children's biological father. But the doctor was never found guilty of any offenses, wasn't forced to admit wrongdoing and did not have his medical license revoked.

However, in his will, filed in District Court in February after his death in November, the doctor not only acknowledged he is the biological father of all four children, but also left a haunting footnote for other women who had trusted him decades earlier.

The document states additional, unnamed offspring of the physician may be identified after his death, leaving open the possibility that other women unknowingly gave birth to Fortier's children after he performed artificial insemination on them.

Court documents filed in February in connection with Fortier's estate state that if "there shall be an additional child or children determined to be my natural

Court documents, filed in February in connection with Fortier's estate, state that if "there shall be an additional child or children determined to be my natural child or children, and if any such child or children shall survive me, then and in such event, such child or children, I have intentionally omitted from any share in the benefits of my estate."

Former patients and their children, however, may find it difficult to get questions answered about the doctor.

Public records of Fortier's fraud either don't exist or have been hidden from public view, and plaintiffs in the lawsuits against him have been silenced by confidential settlements that prohibit them from discussing their case.

The state Board of Medical Examiners, which licenses physicians in Nevada, last year launched an investigation into the allegations against Fortier, but dropped its probe following his death.

As a result, Fortier never lost his license or received any discipline in response to the allegations that prompted the investigation, said Lyn Beggs, deputy general counsel for the Board of Medical Examiners.

"He died and we dropped the case when he died," Beggs said. "If a doctor is dead, there is no public benefit in digging this stuff up. … Our role is not to dig up stuff from 35 years ago, but to protect the public here and now."

Normally, details of the court cases would have provided details about Fortier's conduct to any member of the public who cared to inquire. But about two weeks after the first lawsuit against Fortier was settled out of court in August 2001, District Court Judge Lee Gates sealed the case from public view.

As a result, the allegations lodged by patient Mary Craddock, plus motions, witness lists, depositions, two days of courtroom testimony, the judge's rulings, the doctor's DNA samples and other information on that case, are all hidden from other patients Fortier treated over decades in Nevada.

Gates refused to comment on the Craddock case or his reasons for sealing it. Attorney John Wawerna, who represented Fortier in that case, and attorney John Lee, whose firm represented Craddock, couldn't be reached for comment.

Las Vegas lawyer Kathy England, who is on the state Supreme Court's Commission on Preservation, Access and Sealing of Court Records, said she wasn't familiar with the Fortier case but said it raises questions about the privacy rights of litigants.

Fortier and other defendants repeatedly accused of wrongdoing shouldn't be permitted to keep court records private, but Fortier's patients and their children are entitled to some degree of privacy because they are victims, England said.

"The public's right to know about injurious activities transcends the bad actors' claim to privacy. When you have committed an injurious act, especially one that is not an isolated incident, there may be a public interest in having that repetitive conduct disclosed publicly in a lawsuit. … I don't think someone who artificially inseminates people fraudulently has a legitimate claim to privacy."

Las Vegas attorney Richard Myers, who also was appointed to the state Supreme Court commission, said the case should not have been sealed.

"That sounds like something the public would have an interest in, and it shouldn't be sealed," Myers said. "If there are other patients that he artificially inseminated … (information about the case) is something that they would want to know and have a legitimate right to know."

While the Craddock case was sealed, a subsequent lawsuit filed in 2003 against Fortier by Patrick and Carolee Fullmer was not sealed. It is hidden to some extent, however.

Using the District Court's online computer database, users can find out about lawsuits, the litigants, attorneys and judges in each case, the dates of hearings and the minutes of decisions in each case and other information. Or, interested parties can look at entire files for each case at the courthouse records office.

However, when searching for lawsuits involving Fortier, simply searching by his name, "Fortier, Quincy," is not sufficient as it is when searching for most litigants.

When just the doctor's name is entered, the Fullmer case and other cases against the doctor do not appear on the computer screen. To locate the case, one must know the names of the other litigants in each case, or must remember that Fortier was a physician and enter his name as "Fortier MD, Quincy."

The Craddock case is just one of dozens of lawsuits sealed by District Court judges between 1990 and 2006, according to records of sealed cases requested by the Review-Journal.

Judges claim to have inherent authority to seal lawsuits, but critics have said keeping lawsuits from public view is generally prohibited by Nevada law.

No information is available to the public about sealed lawsuits, but the Review-Journal was provided with the identities of litigants in some of the cases. They include people and groups that are wealthy or wield influence in politics, business, medicine and the courts. They include doctors, lawyers, politicians, casinos, judges, public utilities and public agencies, such as the Clark County School District and Las Vegas police.

Like other litigants in sealed cases, Fortier had influential friends or family members.

According to Fortier's will, his daughter is married to powerful Carson City lobbyist Harvey Whittemore, who is developing the 43,000-acre Coyote Springs master-planned community 50 miles north of Las Vegas. The massive project has been approved for construction of up to 159,000 homes.

Fortier, who received his Nevada medical license at the end of World War II, was named Doctor of the Year in 1991 by the Clark County Medical Society, and he helped open the first women's hospital in Las Vegas in the 1960s, according to his obituary. The Massachusetts native and former Air Force physician also helped open Faith Lutheran School in Las Vegas and reached the rank of commander with the Air Force Reserve unit at Nellis Air Force Base, the obituary said.

Although Gates sealed the Craddock case for reasons left unexplained, the handful of Review-Journal articles written about the Craddock case and other lawsuits filed against Fortier shed light on that sealed case.

In her lawsuit filed in 1996, Craddock accused Fortier of defrauding her in the 1970s by twice using his own sperm to artificially inseminate her. The Craddocks' daughter was born in 1975, and their son was born two years later. Craddock's grown daughter, Heather Craddock, in 1994 told her mother an elderly Fortier had phoned and divulged to her that he was her biological father.

Records of an affidavit, and records of questions posed to the doctor before the court-ordered DNA tests, state that the doctor denied that he is the biological father of the Craddock children. However, the records also state that Fortier recalled that Craddock gave her verbal consent for each procedure

after the doctor explained that the fluid to be used contained the sperm of her husband and others.

Three days after the trial started in August 2001, and two days after Mary Craddock's tearful testimony, the trial abruptly ended when litigants announced they had settled the case out of court, according to Review-Journal articles at the time.

Heather Craddock filed a lawsuit against Fortier in 2000, and she also received a confidential settlement before that case went to trial. The daughter's case was not sealed by a judge, according to court records.

After reading newspaper accounts of the Craddock case in 2001, Patrick Fullmer underwent DNA tests that showed he wasn't the biological father of his two children conceived through artificial insemination of his wife by Fortier. The children were born in 1980 and 1985.

Attorney Brent Bryson, Fortier's attorney in the Fullmer case, wouldn't comment on the case. Attorney Jeffrey Galliher, who represented the Fullmer couple, also wouldn't comment.

But documents filed in the case assert that Patrick Fullmer's business suffered, the couple argued about whether to undergo DNA testing, and they received counseling from a minister at their church after learning about the Craddock case. The situation tore the family apart, and Patrick Fullmer filed for divorce in October 2003, the documents assert.

They did conduct DNA testing, but their lawsuit says, "Upon learning the truth, they suffered depression, mental anguish, emotional distress and anxiety which affected their marital relationship. Carolee continued to emotionally struggle with the impact of the DNA results. She suffered severe depression and would not get out of bed for days."

In his defense, court records say, Fortier asserted at the time of the lawsuit that he had received oral consent from Patrick and Carolee Fullmer to use semen that was not exclusively Patrick's, but would come from a "donor mix." However, Fortier never produced written consent, and claimed at the time he was unable to find any medical records for Carolee Fullmer's treatment in the early 1980s.

After the Fullmer case was settled out of court in 2006, the state Board of Medical Examiners launched its investigation of Fortier in response to a 2003 state law that wasn't enacted until after the Craddock case had concluded. The law requires doctors to notify the board when a malpractice lawsuit is filed against them, and it requires the courts to notify the board after a physician loses or settles a malpractice case, Beggs said.

Although the board dropped the case after Fortier died, the agency's Investigative Committee issued a complaint in the case after it determined there is "reasonable basis to believe" Fortier violated state laws.

he investigation centered on violations of laws that prohibit doctors from engaging in conduct "intended to deceive" a patient and that "violates the trust of a patient and exploits the relationship between the physician and patient for financial or other personal gain," according to the complaint.

Patients whose treatment is the subject of a complaint are not identified in the document. Instead, they are referred to as patients A and B.

A state law enacted in 1979 required that a physician file a consent form, signed by both parents, in which they would have agreed to use semen from other donors during an artificial insemination procedure.

The board complaint states that Fortier did not file such a form.

And the complaint goes on to state, "Patients A and B did not give their consent nor were they notified that anyone else's seminal fluid was utilized during the artificial insemination procedures."

LV doctor wins suit brought by son

Tuesday, Feb. 12, 2002 | 9:53 a.m.

A jury Monday rejected a 48-year-old Las Vegas man's claims that his father, a local obstetrician and gynecologist, sexually and physically abused him when he was a child.

Quincy E. Fortier Jr. claimed that after he watched a videotape about child molestation as part of court-ordered therapy, long "frozen memories" came to the surface about his namesake.

Fortier alleged that he realized he had been sexually abused by his father between the ages of 3 and 14 and that he had also watched his father abuse his siblings and other children.

Fortier filed a lawsuit against Quincy E. Fortier Sr., 89, in October 2000, saying he became addicted to drugs and alcohol at the age of 10 and has experienced a myriad of other problems as the result of the alleged abuse.

The doctor's attorneys, E. Brent Bryson and Thomas Pitaro, told jurors the younger man was after his father's money.

The jury took about an hour to find on behalf of the elder Fortier late Monday. The attorneys involved in the case could not be reached for comment this morning.

Mary Craddock, a woman who claimed the doctor secretly used his own sperm while artificially inseminating her in the 1970s, settled her lawsuit against him in the middle of a trial in August.

Attorneys for both sides in that case declined to comment on the specifics of the settlement, but said the agreement also takes care of a lawsuit filed by a daughter born as a result of the procedure and a potential lawsuit by a son.

John Stuart Foster FRS FRSC (May 30, 1890 – September 9, 1964) was a Canadian physicist.[1][2][4]

Biography

Born in Clarence, Nova Scotia, he completed his Ph.D. at Yale University with a dissertation on the first measurements of the Stark effect in Helium. In 1924 he gained an appointment as assistant professor at McGill University in Montreal, where he taught physics. He became associate professor in 1930.

During World War II he served as a liaison officer for the National Research Council, working at the MIT-run Radiation Laboratory on radar research and development. He developed a fast-scan radar antenna that became known as the "Foster scanner".

He returned to McGill in 1944, where he directed the construction of a 100-MeV cyclotron. This instrument was commissioned in 1949. At the time this was the second largest in the world. From 1952 until 1954 he was chairman of the physics department at McGill. He died in Berkeley, California.

Legacy

The *John Stuart Foster Radiation Laboratory and Cyclotron* at McGill was named after him in 1964 and this is engraved on the side of the building now known as the M. H. Wong Building.

His son, John Stuart Foster Jr., graduated from the University of California in 1948, then became director of the Lawrence Livermore National Laboratory, director of Defense Research and Engineering for the U.S. Defense Department, and Vice President of T.R.W., Inc.

Awards and honors

- Fellow of the Royal Society of Canada, 1929.
- Awarded Levy Medal, Franklin Institute, 1930.
- Henry Marshall Tory Medal, 1946.
- Elected a Fellow of the Royal Society of London, 1935.[1]
- The crater Foster on the Moon is named after him.

John Stuart Foster Jr. (born September 18, 1922) is an American physicist, best known as the fourth director of Lawrence Livermore National Laboratory and as Director, Defense Research and Engineering under four Secretaries of Defense and two Presidents.

Early life and education[edit]

Foster was born September 18, 1922 in New Haven, Connecticut. He received his Bachelor of Science degree in 1948 from McGill University, where his father, Canadian physicist John S. Foster, Sr., was a faculty member. He received his doctorate in physics from the University of California, Berkeley in 1952, while serving as a staff member of the University's Lawrence Livermore National Laboratory in California.[1] In 1979, he received an honorary Doctor of Science from the University of Missouri.

Early career[edit]

During World War II, before he received his bachelor's degree, Foster began his career in the Radio Research Laboratory at Harvard University. He was an advisor to the 15th Air Force on radar and radar countermeasures in the Mediterranean Theater of Operations in 1943 and 1944. In the summers of 1946 and 1947, he worked on the Canadian nuclear power project in Chalk River, Ontario.[1]

Lawrence Livermore Laboratory[edit]

In 1952, Foster was recruited to Lawrence Livermore Laboratory by founder Edward Teller, and became a division leader in experimental physics. He was promoted to associate director in 1958, and director of the Livermore Laboratory and associate director of the Lawrence Berkeley National Laboratory in 1961, in which positions he served until 1965.[1]

Foster with Secretary of Defense Melvin Laird, 1972

Department of Defense[edit]

Foster was appointed Director, Defense Research and Engineering, a position then considered the number-three job in the Department of Defense, by Secretary of Defense Robert S. McNamara in October 1965. He continued in this position until June 1973, serving under Presidents Johnson and Nixon, and under Secretaries of Defense McNamara, Clifford, Laird, and Richardson.[2]

Later career[edit]

From 1973, Foster was vice president, science and technology of TRW, retiring in 1988. He continued to serve on the board of directors of TRW from 1988 to 1994. He is a Consultant to Northrop Grumman, Ninesigma, Wackenhut Services, Inc., and Defense Group, Inc. He is also Chairman of the Board of Pilkington Aerospace, Inc., and Chairman of Technology Strategies and Alliances.

From 1973 until 1990, he was a member of the President's Foreign Intelligence Advisory Board. He was a long-serving member of the Defense Science Board, of which he served as chairman from January 1990 to June 1993.[1]

Public positions[edit]

Foster's public positions have consistently reflected his support of a robust U.S. nuclear stockpile.[3][4]

During the George W. Bush administration, Foster was a prominent advocate for a return to nuclear testing and for the design of a new generation of U.S. nuclear weapons. He chaired the "Panel to Assess the Reliability, Safety, and Security of the United States Nuclear Stockpile," created in 1998 by Republican Sen. Jon Kyl of Arizona, a longtime foe of the Comprehensive Test Ban Treaty. The panel, popularly known as the "Foster Panel", issued several reports advocating increased weapons spending.[3] [5][6]

Foster was a prominent member of the Commission to Assess the Threat to the United States from Electromagnetic Pulse (EMP) Attack, established by the 2001 defense authorization act. The Commission's report called for strong defensive measures across a wide range of industries and public services.[7]

Honors and awards[edit]

Foster received the Founder's Award from the National Academy of Engineering in 1989, and the Enrico Fermi Award in 1992. Other awards include the Ernest Orlando Lawrence Award of the Atomic Energy Commission (1960), the Defense Department's Distinguished Public Service Medals (1969, 1973, 1993), election to the National Academy of Engineering (1969), the James Forrestal Memorial Award (1969), the H.H. Arnold Trophy (1971), the Crowell Medal (1972), the WEMA Award (1973), and the Knight Commander's Cross (Badge and Star) of the Order of Merit of the Federal Republic of Germany (1974). Foster is a commander, Legion of Honor, Republic of France.[1]

2021-01-aip-org-john-s-foster-interview-from-1991.pdf

https://www.aip.org/history-programs/niels-bohr-library/oral-histories/33455

Interview date: Wednesday, 7 August 1991

- Aaserud: So that's how you come into the picture. I mean it's interesting, we have a connection in your previous generation too. Your father was rather closely connected to Bohr in the 1920s.
- Foster: Right. I remember when Bohr used to visit us in Montreal. I would drive him around. I can remember that.
- Aaserud: Oh, great. Well, it would be lovely to talk about everything, but I guess in a telephone conversation we should try to limit it to JASON this time around at any rate.
- Foster: Okay.
- Aaserud: Although I think it would be interesting to interview you about other things as well sometime. Has that happened? Has anybody interviewed you?
- Foster: No, no.
- Aaserud: The only thing I've come across is an old interview with you when you were still DDR&E. It's an interview that's deposited at the Johnson Library.
- Foster: I see.
- Aaserud: But that was very specifically oriented to that. Now, before we start, I would be very happy to receive any kind of biography or vitae or bibliography, if you should have it, if you could send it to me at some point, because it would add to my knowledge of the people that are involved in my study.
- Foster: Okay. I can have June do that.
- Aaserud: Okay. Great. Wonderful. And you are not writing any autobiography or anything of the sort.
- Foster: No, no.
- Aaserud: No time for that.
- Foster: No, that's right. No, in fact I pay no attention essentially to history, to the wake I leave behind. I spend my time looking out ahead and seeing what I can do to get us there.
- Aaserud: I hope I'm not doing the opposite.
- Foster: No, no. I'm relying on you to take care of the wake.
- Aaserud: Good. So, well, the period that I'm mainly interested in then is the period from about 1957 to 1975. So, just to get this in the context of your career, perhaps you could say what you were doing during those years. You were Director of the Lawrence-Livermore Laboratory I suppose.
- Foster: That's right. So I was in the Lawrence-Livermore Laboratory from 1952 to 1965. And I was the Director there from 1961 until 1965. So that means that Edward Teller was the Director of the laboratory from about 1958 or 1959 to 1961, then Harold Brown was the Director for about nine months, and then he left to the Department of Defense, and so then I was the Director for about four years, and then I left to replace Harold Brown. You know, as he said to me, "There is nothing like dealing with a reliable firm." Because he followed Herbert York, who was the Director of Livermore, and then I followed, and so there were three of us in a row.
- Aaserud: That was only broken after you, that tradition.
- Foster: Yeah, so I was kind of in the third man theme.
- Aaserud: And then you were DDR&E from 1965 —
- Foster: — Until 1973. So I went through a Democratic administration, and then was selected by a Republican administration. I guess that's the only time that has happened. And in fact being there for eight years was also uncommon.
- Aaserud: Well that's a record that hasn't been broken, has it?
- Foster: Yes, and I am not sure that is a good record! Anyway, let's see. Your subject deals with the JASONs.
- Aaserud: Yes. The first 15 years of them. So I suppose my first question to you is whether you were involved in or had an opinion of the origins of JASON, whether that came through you while you were still Director of the Lawrence-Livermore Laboratory.
- Foster: Yes and no. I knew of the JASONs while I was at Livermore, and of course then I had rather frequent contact with them when I worked in the Pentagon.
- Aaserud: But as for the origins of JASON, that's a complex history.
- Foster: Yeah, but I think you now know more than I can add. I've heard of the origins of the JASONs a number of times, as well as the origins of the Defense Science Board, and so on. I don't think I can add anything there.
- Aaserud: No. You didn't partake in Project 137 for example?
- Foster: No, I did not.
- Aaserud: No. And you did not discuss with Goldberger or Bruekner or Watson.
- Foster: Yes, with Brueckner and Watson, yes, but I don't think I contributed much of that.
- Aaserud: Right. They thought originally of establishing a private company.
- Foster: Yeah.
- Aaserud: Which would essentially do the same thing. And then they were diverted by Townes, who was Chief Scientist of IDA.
- Foster: No, and in retrospect, you know, I think that Townes had the right idea. And in fact even today when we have task forces working and Charlie Townes is a member, he has the right idea. So I think in retrospect what makes JASON unique is that they were founded on the basis of what Townes suggested. There are hundreds of title companies that now do what some of the early members wanted JASON to do. Let me make a point which sort of sticks with me with regard to the JASONs. You know, when I first got into the Pentagon, it occurred to me that I was rather isolated. I mean, you know, you come in at seven or seven-thirty in the morning, and you leave at seven or seven-thirty in the evening, and all day long there are people coming in and you are reviewing things and making decisions. And by and large, you are exposed only to what comes in, and very seldom does one get a chance to go out. And wherever you go, even if you were to go rather extensively, you only see a trivial fraction of the contributors to National Security.
- Aaserud: Do you think your position was particularly bad, or what we should say, in that respect?

- Aaserud: Do you think your position was particularly bad, or what we should say, in that respect?
- Foster: No. It's just that that's the way it is. Now, as a consequence I kept asking myself, you know, "I'm leaving here in two years, or I'm leaving here in four years for sure. What is it that I am missing? What is it that when I leave and I look back on it I will say now, you know, what is it that I should have done?" Well, that problem came to mind a number of times during a year, and so I would say, "Okay, what I'm gonna do is ask the JASONs, and I will ask the Defense Science Board, and so on, I will ask people, 'What is it that we should be doing?'"
- Aaserud: That general a question.
- Foster: Yeah. That general a question. And so in particular I remember when I first came in the Pentagon I asked McNamara, you know, "Give me five things that you would like to see me focus on." And one of them was the war in Vietnam, I mean what can be done to improve the effectiveness. So, you know, one turns around then and says to the technical community, "Hey, here's a situation that's important. What is it that you think we might be able to do to help?" And I remember making a call on the JASONs and on the Defense Science Board, and in fact making a video tape and getting that around to the in-house laboratories and so on.
- Aaserud: Does this video tape exist?
- Foster: Oh, I'm sure it does, but, you know, I don't know where it is. But, you know, maybe it's at home. Maybe I've got a copy at home.
- Aaserud: Okay. Well that would be interesting.
- Foster: By the way, it may be on film rather than video.
- Aaserud: Yeah, at that time, I'm sure.
- Foster: Now, as a consequence, you know, I remember that the JASONs started to address the question of the Vietnam War.
- Aaserud: That was from the outside independent of you, their addressing the question of the Vietnam War?
- Foster: Yes, that's right. And also what should the United States be doing technologically in that effort, or to support that effort. And that helped a lot. That raises now another point that comes to mind, while we're chatting here. Why is it that JASON is important? I could think of a few reasons.
- Aaserud: You think it is in the first place.
- Foster: I think it's extraordinarily important. I think it's more important than people realize, because of what does not happen because of the existence of JASON.
- Aaserud: A corrective agency or something.
- Foster: Exactly. So, let me just think now out loud what that is. First of all, these people are professors from universities. Now the universities in the United States are critical members of the National Security community. I mean they really are very critical members of the community, just as critical as the in-house laboratories, just as critical as the industry. So what we have is some selected members from that university community who come in and can advise the government on what is possible, scientifically what is possible. They can provide a coupling of scientists and science to technology, and the coupling of that technology to applications, and then to systems concepts and systems capabilities. They have been extraordinarily useful to critique programs to address problems. The Department of Defense has a host of problems, some of them admit to scientific or technological attack. And these people have a very special vantage point in the universities, that can bring something to address those problems that you cannot get from industry, and you don't get it from in-house laboratories.
- Aaserud: So they're unique in that respect, you would say.
- Foster: Very unique. Look, that's one general thing that comes to mind. Another, perhaps even more important function, is that these professors expose their students to the realm of National Security. Now, you know, there is a tendency in universities to be more liberal — more to the left of center perhaps. And it would be perhaps unbalanced if it were not for the presence of some professors who were concerned about National Security. So the JASONs provide an opportunity for the National Security community to give them some vision, and some orientation, some understanding of the National Security situation, which they then pass on to their students. Now some of those students then go full-time to work in the area of National Security.
- Aaserud: Yes. Well that was in fact an aspect of the planned JASON that was seen as unique at the time of its establishment.
- Foster: Yeah. So as a customer, I could see the value of that.
- Aaserud: Do you think that was something new with JASON? Had there been that kind of linkage before JASON in the same way or to the same extent?
- Foster: Certainly not in the same way, certainly not to the same extent. It was clearly, from their point of view, something that was badly needed at that time. The fact that it still exists, the fact that it still contributes in a very important way, makes it clear that it is rather unique. I mean, let me just give you an example. About, I don't know, three or four years ago I called up — I guess it was Frank Press or somebody who was the head of JASON at the time, I just forget who it was — and said, "Look. I've really got a problem here." At that time I was on the President's Foreign Intelligence Advisory Board, and we were concerned about the Soviet penetration of the American Embassy building that was being built in Moscow.
- Aaserud: So this was fairly recent.
- Foster: Yeah, that's right, several years ago. And what I wanted to do was to make sure that we had the very best scientific capable minds looking at that problem, and particularly looking at what it was that the government people were doing. So, you know, it was just a simple phone call, and then within a matter of, oh, not more than two months, several of the members of JASON had worked the problem and had of course gone to Moscow and delivered a report, both verbally and of course in writing. Now that's a very classified matter, but what I think is important to point out is that the existence of that kind of organization and the ability of it to react very quickly with the very best scientific capability is a critical thing for the nation. Let's see. So what I was saying is they provide an exposure to students that in turn turn out to get interested in the matter of National Security and then go into industry and so on. Now some of them will end up going into the Executive Branch, into the government. Now the Government only calls, only uses about 2 percent [tape inaudible for a few minutes.] That is the value. I think when one dwells on the matter of this or that individual who was controversial, who was troublesome, who was raising hell about this or that, one misses the value.
- Aaserud: Well, as you say, it might keep the system awake too.
- Foster: Yeah. It's crucial.
- Aaserud: I mean, that was your point about the Vietnam debate at the universities too.
- Foster: Yes. Now, you know, frankly sometimes these individuals make so much fuss because we don't listen. And these people care. And they think it's important. And so they will keep raising their voice again and again, louder and louder, until they feel that they have been heard.
- Aaserud: About the technical questions that they do as JASONs, or more generally?

- Foster: No. I mean as individuals in JASON. Now clearly it happens in other forums, and I'm not trying to say that everybody who raises hell has the same motivations, but at least when I think about JASONs, and they get upset about something, I think it's important. And I reject it when people feel that, as individuals or as an organization, they are troublesome. I think that's exactly wrong. They are an important national asset.
- Aaserud: Now, when you were DDR&E, JASON was wholly funded by ARPA I believe, at least during the first few years. But on the other hand you had direct contact with them. Now, did their advice go mostly through you, or was it you who made use of them, or was it mostly ARPA that made use of them, or how was that?
- Foster: I don't know the balance. The point is, they would come in and describe what it is they thought it was important to be working on, they would then come and tell me what it is they found and what I ought to do, and they would do the same thing with DARPA. But I don't know in detail, you know, how much it contributed to either side. And then of course I would work with DARPA often, so that meant that that loop was closed.
- Aaserud: Conceivably they could come to you when they didn't get through with ARPA. That might happen too perhaps.
- Foster: Oh sure. And if they couldn't persuade me, they could easily persuade ARPA. So, you know, either way.
- Aaserud: But they used the channels effectively is what you're saying.
- Foster: Oh yes. Ohhhh yes.
- Aaserud: Okay. Let me just turn the tape here. [Tape 1, Side 2] I would also like to talk a little bit about the mechanism for choosing projects. I mean, how was a project chosen while you were DDR&E by JASON to the extent that you were involved in that? And to what extent were JASON free to choose their own projects, to what extent was it projects that were presented to them?
- Foster: I'm not sure that my memory is very good on this. Or, put it another way, what I can remember could well be a distortion. I remember thinking about what it is that JASON should be working on, because the chairman would come in and ask me. The same would happen with regard to the Defense Science Board. Those two organizations held summer studies.
- Aaserud: It was a one-to-one discussion between you, often.
- Foster: That's right. And so what would happen is that usually in the fall the chairman of each of them would come in — separately, of course — but say, "Look, what is it you think we ought to be thinking about?" And I'd say, you know, "I don't know. I'd better think about it." And what I remember quite clearly was that for me it was a challenge — a challenge to think about what are the problems which I face where I really need an answer by next September. Because next September the JASONs will report out.
- Aaserud: After the summer study, yes.
- Foster: Next September the Defense Science Board will report out. What answers do I need then, to what kinds of problems? And of those, which ones are suitable for the JASONs to think about? And so I remember thinking about it, and then around December or January and February I would try and do what I could to contribute, and then I would also hear what they thought were important. And I remember going down lists of problems. And, frankly, my impression is that no matter how hard I thought I worked at that, there were people who came in with these other ideas that, if anything, were better than mine. Well, you know, which is exactly why these people are important.
- Aaserud: Was it the full list of summer study projects that was developed that way, or was it part of it?
- Foster: Okay, I don't know the answer. There would be more items on that list than they could handle, without any question, and I could have some preference, I could suggest some preference.
- Aaserud: Well let me phrase the question a little differently perhaps. Were all problems that they were going to deal with, I mean for ARPA, for possibly other agencies, coordinated through you and came up in the discussions that you had on a one-to-one basis with Hal Lewis or whoever it was?
- Foster: Well it coordinated yes that way, but I don't remember consciously coordinating the JASON studies with the studies performed by RAND or MITRE or the Defense Science Board or the Institute for Defense Analysis or so on. I think frankly that is an area where I could be criticized for not having perhaps consciously tried to make the proper assignments, to either have some duplication where it was important or to avoid unnecessary duplication.
- Aaserud: But I guess it was automatic to some extent. I mean, these were different organizations to some extent.
- Foster: That's true. That's true. But I've thought about it subsequently that it's an area where I failed to take full advantage.
- Aaserud: Of the differences.
- Foster: Yeah. Because sometimes it would be important, for instance in ballistic missile defense. There DARPA had a leading role for a decade or so, well, from about 1962 until, I don't know, 1967 or 1968. And in that period the JASONs and others were of enormous value. And the question I think was whether or not I properly used the Defense Science Board and the Institute for Defense Analysis and other forums to get independent views on that. So, if anything, I guess I'm not sure that I consciously worked enough on the matter of getting necessary duplication. I'm not so worried about the unnecessary duplication.
- Aaserud: But nevertheless, could you say something or could you specify what was specific to JASON — if it was specific, if it was special in relation to these other organizations that you utilized.
- Foster: Oh. Well, yes. I think of JASON as an organization to think of as standing individuals to think about a problem that requires the application of first principles. And not an organization to provide some kind of a refinement of a well-developed system. So if you've got a fundamental problem, like anti-submarine warfare, or ballistic missile defense, or worldwide surveillance, or whatever. That is where you are trying to pioneer something, you've got a very important problem and technologically you have not been able to crack it, so you ask JASON.
- Aaserud: Well that is somewhat different from JASON as a correcting organization, so it serves two functions then.
- Foster: Oh sure! Oh sure. Oh yeah. Oh, of course.
- Aaserud: I mean both new ideas and killing of others' ideas.
- Foster: Yes. Oh yes. Totally different.
- Aaserud: But they served both functions.
- Foster: When you expose JASON to a program, they can critique it, the way it's being done. And that's important. But they also may come in and say, "Look, what you're doing is rather straightforward. The problem is, it's not elegant. It's enormously inefficient. I mean there's a whole new way to approach this thing. Here's what you ought to be thinking about." Or they will just say, "Look, there is a whole revolution in science which now permits one to do this job entirely differently." So JASON can play both roles.

- Aaserud: In terms of the role of new ideas and applying new developments in science, what would you point to as one or two particularly important developments that JASON contributed to during your tenure as DDR&E?
- Foster: Oh, they contributed to the, well, the ballistic missile defense program, they contributed to anti-submarine warfare, to overhead surveillance, to the application of satellites to navigation, what do you call it, GPS, communications. A whole host of things. Finding targets in the foliage.
- Aaserud: See, I'm asking you, well, from a general interest of course, but also because I think that if I'm going to develop this into a full-blown study I would need to have one or more case studies of specific projects that they did to get a sense of how they worked from, you know, of applying the first principles, and all the way until the advice was made and preferably acted upon.
- Foster: Well let's see. As I recall in your letter, you said that you have access to some of the information at MITRE. Is it not in those records?
- Aaserud: No, I wouldn't say that. It is fully unclassified records, and I think that I would need some declassification to get to a project that is representative.
- Foster: Well okay, so I think the thing to do there then is to see what can be done to declassify that stuff, at this stage.
- Aaserud: But there's a balance there. I mean, I need to find a project that is representative and at the same time something that is likely to be declassified — at least some of the information there.
- Foster: I don't know. Why not just ask the JASONs to take a look at that?
- Aaserud: I was wondering whether you had any opinion on one or two projects that you thought might be more likely than others with your experience.
- Foster: Well let's see, I don't know, some of the stuff they did with regard to Vietnam might be one area that one could declassify.
- Aaserud: I think some of that may have been declassified, because there is so much interest in that particular episode, so that's one possibility. But to my mind that is a little untypical of what JASON did. Or, I don't know if you would agree with that.
- Foster: No. I don't agree. I wouldn't think of it as atypical.
- Aaserud: Well, you started talking a little bit about that. That was perhaps one of the projects in which you were most closely involved in working with JASON. So I was wondering whether you had a little more to say about the DCPG I suppose it was called, and JASONs and your own role in that.
- Foster: I think we have to be very careful here about the security matter. You know, the recent operation in the Gulf, while it was very successful, it was simply applying on a large scale techniques which were developed and first tested in Vietnam, while they weren't on a large scale in Vietnam, and the conditions there were perhaps not as good as in the Gulf, in fact in many cases nowhere near as good. But I'm a little concerned about specific examples just because of security matters. I just don't know the details about the security that's put on each.
- Aaserud: You are talking about smart weapons?
- Foster: Yeah, sure. And, you know, whether the security is now reduced because of the Gulf or not, I don't know. This may be just too early to say.
- Aaserud: But on a person-to-person basis, you worked both with JASON and what was called JASON East at the time, right?
- Foster: That's right.
- Aaserud: There was a collaboration of those older MIT people, generally speaking and JASON.
- Foster: Yeah, right, that's right.
- Aaserud: And that went all the way up to McNamara. I mean, he was also directly involved in that, correct?
- Foster: Oh certainly, yes. In fact I remember one meeting when McNamara and I went to meet with the folks at MIT, and they described their concept of such a system, and, you know, I was supportive, as was McNamara. I also remember one request they had, and that was, you know, to agree to stop bombing the North if you would put in this barrier. And I remember Bob not committing to that. It isn't quite as if he could make that trade.
- Aaserud: Well, there are some JASONs that are a little bitter about that.
- Foster: No, no, well but that's, you know, that's fine. First, I think it's quite proper that the JASONs should feel free to make that observation. On the other hand, it's quite proper for the Secretary of Defense to not accept and act on those recommendations.
- Aaserud: Of course, of course. But I sense that Goldberger for example felt that the deal was made.
- Foster: I was there, and there was no such deal. Bob was silent. He did not agree. And I remember that. Heck, I would have had to take some actions if he had agreed to it, so —
- Aaserud: Well, I'm glad you say that.
- Foster: But, you know, look, I think this is wonderful, you know. If Murph can be unhappy, he cares, and he had his say, that's fine. And now that he would continue to be unhappy I am sorry about, because it's over.
- Aaserud: No, it seemed that he was still concerned about that; that that was an episode that came back to him. But, I mean, he's been involved in JASON since then so —
- Foster: Oh certainly.
- Aaserud: So there were others of course who left as a result of the Vietnam episode, but surprisingly few — very, very few, considering the reactions on campus I would say.
- Foster: Oh yes, absolutely.
- Aaserud: And a lot of people told me that, I mean, they stayed on because of that, because they didn't want to lose face, also. But that's, another matter. But, it did have an effect on JASON, because this was fairly new. I mean, this was a new experience that they came into the headlines and got such notice. I have, as I said, looked at material at the MITRE Corporation, and I have entered it on the computer so I can see whenever your name comes up in it. And the first time so far that I've seen your name come up in those records is regarding a meeting at the Eglin Air Force Base in March 1968, in which the effect of JASON's involvement in the Vietnam War on their work was evidently discussed. And a decision at that meeting was that "Lewis and the steering committee will develop a basis for future choices of study. Lewis will talk to J. Foster about this."
- Foster: Yeah.
- Aaserud: I don't know if that rings a bell at all with you.
- Foster: No, it doesn't. I'm sorry, it does not.
- Aaserud: And then this seems to be related. In August, 1968, it says, "the possibility of JASONs doing arms control work through ARPA on behalf of DOD

- Aaserud: And then this seems to be related. In August, 1968, it says, "the possibility of JASONS doing arms control work through ARPA on behalf of DOD, ACDA or CIA was discussed. H. Lewis will talk to J. Foster." What this seems to imply to me, and you can correct me on this of course, is that JASON was trying to spread their base as a result.
- Foster: That's true. And, you know, I think that would have been an important thing. Let me just say why. There is a tendency, when one is talking about arms control, for a polarization to develop, I mean for the State Department to tend to want to go in one direction, and the Department of Defense to have a different view, and the White House perhaps have still a different view, and the Arms Control Agency to have some other view. And I think it's important to have an organization that has an opportunity to listen to the voices on several of those agencies and departments. And so, you know, I tend to be supportive or sympathetic about that. On the other hand, you know, in a sense you are asking for trouble to set that up, unless, unless the individuals are rather wise and careful. And so there is an example where someone like Charlie Townes is exemplary. As long as he would have a voice in what the organization did, I think you could feel quite comfortable. At least I would.
- Aaserud: Well, you're talking in general terms now; you are not talking about the role of Townes in this particular case.
- Foster: No no. No, that's right. No, but there are a number of such people. I'm just giving an example.
- Aaserud: Yes, of course, but that's what comes to mind.
- Foster: Yeah.
- Aaserud: Well, if I go down the list here — it's not a very long list, so don't worry — of your involvements that has come out from my database of documents here, there was a discussion in 1969 and I think in the following years of whether a British equivalent to JASON could be established.
- Foster: That's right, yeah.
- Aaserud: And that raised some problems about security —
- Foster: Yes.
- Aaserud: — and things like that. I wonder whether you could just say, state your involvement in that, and how that was presented to you, and what happened to it.
- Foster: No, frankly I don't know. I don't know the details. I remember you mentioned that in your letter. I can only say now how I think I would have felt about it. By that time I was beginning to pay more attention to the NATO portion of it. You know, it takes you a year or two to sort of understand what's going on in the United States. And it's unfortunate. But then you begin to realize that there is a bigger piece. There is NATO. And in fact to be quite honest about it, I think it was not until my third or fourth year that I began to do my job within that regard. But then in the four years that followed, I may have overdone it, in working particularly with France and Germany and England. Now, I believe that particularly with regard to the United Kingdom, they could benefit enormously from an organization like JASON, and certainly they have the intellectual capabilities there to do just that. Now, I think the question that would have come to my mind was whether or not something of that nature, whether or not it did not already exist. Because, you know, people like Bill Cook and Bill Penny and others work together all the time, whether they were in office or not.
- Aaserud: Yes, well, it's interesting that you mention Bill Cook, because the letter that I have on my screen here now is a letter from Bill Nierenberg to Hal Lewis from October of 1969 in which he says, "I also talked to Bill Cook and Johnny Foster" in parenthesis after that. So you have probably referred him to Bill Cook about this matter.
- Foster: Yeah. And I think someone like Cook would certainly have recognized the importance of having intellectual input of the type one has from JASON. But whether or not it already existed in some form, even though it wasn't perhaps exactly the way JASON is, I don't know.
- Aaserud: Aha. So you wouldn't exclude the possibility that there was such a group at some point in England.
- Foster: Yeah, whether it's organized formally or not. I have a feeling that something like that existed. You know, the British system has, what do you call it, a closet government, I mean they are always actively working, the organization is not in power. And so those individuals, and particularly the ones who care about national security, are involved all the time, to some degree. But what I do not know is whether they have the university connection in the way that JASON's organization provides it. I just don't know that.
- Aaserud: Well you see it's tempting for a historian — or at least for me — to draw the conclusion that since JASON occurred in the United States and not in Britain say, that is indicative of something unique in the relationship between academia and national security in this country as compared to England and other countries.
- Foster: I appreciate that. But I don't know the answer. Oh, it's an important thing to follow up. I mean, you know, get on the phone and ask them. Well let's see, you could ask, you know, more recently, you might get a hold of Robin Nicholson.
- Aaserud: Oh good.
- Foster: Do you know Robin?
- Aaserud: No I don't.
- Foster: Well let's see. Robin Nicholson — I'll get you his phone number in a moment — he was Margaret Thatcher's Science Advisor until just recently.
- Aaserud: He did not go with Major.
- Foster: No, he did not. No, he left, I don't know, a couple of years ago.
- Aaserud: Okay. Before that episode.
- Foster: He had left perhaps a year before —
- Aaserud: The change of leadership.
- Foster: Alright. Well, while we're on that, let me just see if I can get you the phone number. Hold a second.
- Aaserud: Okay, great. Thanks.
- Foster: Okay, let's see. She's bringing it in in just a moment.
- Aaserud: Okay, great. Well in the meantime perhaps I could read you a letter from Joel Bengston to you in relation to this, dated the last day of October in 1969.
- Foster: Yes.
- Aaserud: "Attached is a copy of Bill Nierenberg's letter," — which I just mentioned to you — "which Hal discussed with you last night. Lest there be any misunderstandings, I know of no suggestion that IDA have any financial involvement with a U.K. JASON. The first intent of my JASON associates is to

encourage the U.K. to get a closer coupling between the university scientists and their defense establishment by setting up an analog to JASON which is appropriate to their governmental structure."

- Foster: Super.
- Aaserud: Yes. "If the two groups work together sometime, that will be just fine, but we would naturally consult with your office on the proper administrative arrangement, including security."
- Foster: Yep.
- Aaserud: So you seem to have warned them a little bit too.
- Foster: Yeah, of course, but I see no problem. Alright, let me give you Robin Nicholson's number.
- Aaserud: Wonderful.
- Foster: [gives number] Sir Robin Nicholson.
- Aaserud: Sir, yes, I have to include that, yes.
- Foster: I'm sorry, I forgot to do it. No, he's a very wonderful person.
- Aaserud: I did try to contact Hermann Bondi about this.
- Foster: Yes. I worked briefly with Hermann.
- Aaserud: Yes. But he wasn't, he didn't remember too much about it. He remembered that some discussions had occurred, but he didn't recall that anything had been effected.
- Foster: How about Bill Cook? You might talk with Bill.
- Aaserud: He's still around too, yeah.
- Foster: Yeah, I don't know, but I tried to get Bill Cook to be an advisor to me, after he retired, but we couldn't set it up, and, you know, it was because the Secretary of Defense saw some problems. And just the same kind of thing.
- Aaserud: Same thing all over again.
- Foster: Security issue. And, you know, I can't tell you in detail why it was. The Secretary was Mel Laird. I told him what I was doing, and he said okay, and then when I was ready to execute it, he said, "I don't think you better do that." And I didn't say, "Come on, Mel. Why?" You know, I didn't feel that proper. I mean, from his vantage point he was beginning to see some difficulty, and so we did not do it.
- Aaserud: I think MacDonald was strongly involved in this, and I think his strategy was to involve some British scientists in a JASON study here in this country in order to, you know, make them see how it functioned and how it worked and maybe that could transpose to England. But I don't think they even got the people here in the first place.
- Foster: Yeah, well, it depends on the study, right? I mean some studies I think it would be a real problem, and some other study I don't think would be any trouble at all.
- Aaserud: Well, I know too little about this episode. I only have bits and pieces of information about it.
- Foster: Okay.
- Aaserud: But I think it's very interesting when I write about this to get this larger perspective.
- Foster: Okay. Well let's see, I'm running out of time.
- Aaserud: Yeah, and the tape is running out too. I had a few more questions.
- Foster: Okay. Go ahead.
- Aaserud: How much time do you have left?
- Foster: None. None.
- Aaserud: None. Yeah, okay.
- Foster: Maybe we could do it some other time, or maybe I could help you after you have picked up some information.
- Aaserud: Okay. Good. Well, the next question was the role of IDA, whether it mattered at all that JASON was part of it, and the transfer to SRI and all that.
- Foster: Okay. On IDA, I think IDA is an extremely important element of the technological support, both to the JCS as well as to several offices — [cut off by tape] [Tape 2, side 1] …particularly because of the Goldwater-Nichols Act and the role of the Vice Chairman. I think a consequence of that will be that IDA will provide an increasing contribution. That there be a connection between JASON and IDA I think is important, but I have seen it as a weak connection.
- Aaserud: Okay. You indicated that the discussions took place directly between Hal Lewis and you. I was wondering whether the head of IDA was kind of a halfway house, or IDA was a halfway house between the two of you and that kind of thing, but it seems that that wasn't necessary, from what you've been saying.
- Foster: That's right. Right.
- Aaserud: Okay. I won't hold you any longer then.
- Foster: Look, I'd be very pleased to chat with you in the future, about some specific thing, although it's not likely that I can contribute. You understand? That was a long time ago. It's 20 years.
- Aaserud: Yes, yes, I know. And I had a conversation with Al Hill yesterday that was much more specific, because he was very strongly involved in the origins of JASON.
- Foster: Ah, yeah. MIT Hill.
- Aaserud: A. G. Hill, Albert Hill, yes, MIT Hill. And, you know, I confronted him with all these documents, which isn't really fair so many years later.
- Foster: Well, I remember working with Al and Killian in fact with regard to the Draper Laboratory.
- Aaserud: Oh yes.
- Foster: You know, there was a big issue there. I mean, they were having this campus problem, and they wanted to split the Draper Laboratory off, and you

know, could we do it, and how, and so on —

- Aaserud: The divestiture problem, yes. Yeah, I am here at MIT now. Okay. So you can talk with Hill and also, let's see, who was the other guy?
- Aaserud: Ruina.
- Foster: Oh yeah, Jack?
- Aaserud: I will talk to him tomorrow.
- Foster: And, let's see, there's one more.
- Aaserud: Rathjens?
- Foster: Well yeah, that's right, but there's another. The fellow who took over as Director of Draper. Bob Duffy. Yeah, Bob Duffy you see would remember that period.
- Aaserud: Okay.
- Foster: But Bob Duffy was not a JASONite.
- Aaserud: No, but neither were you so —
- Foster: Yeah, that's true.
- Aaserud: And I'm concentrating on the outsiders now, or the people who experienced JASON from the outside.
- Foster: Yeah, that's interesting. Okay, I've got to go. I must go.

(Received for publication, June 26, 1936)

The similarity in the pathogenic properties of human and swine influenza virus for ferrets led Elkeles (1) to attempt the transmission of the human agent to swine. He found that very young pigs (2 to 6 weeks old), developed a mild illness when the virus from man was given intranasally under light ether narcosis. At autopsy these animals sometimes showed scattered dark red bronchopneumonic areas of consolidation in the upper lobes of the lung. When cultures of either swine or human influenza bacilli were added to the virus at the time of its administration, the swine developed a more severe illness. The clinical picture was characterized by a low grade fever, apathy, loss of appetite, and sometimes cough. At autopsy varying degrees of bronchopneumonia were encountered. Virus, pathogenic for ferrets, could be recovered from the pneumonic lungs. It thus appeared that Elkeles had produced a disease somewhat resembling swine influenza by the administration to young pigs of human influenza virus mixed with influenza bacilli of either human or swine origin. This observation made more credible the theory that swine influenza may have arisen as the result of the infection of swine in 1918 from human sources (2–4).

The question of the pathogenicity of human influenza virus for swine was of such importance that it seemed to warrant further investigation. The present paper reports our experience in the transmission of human influenza virus to swine.

The similarity in the pathogenic properties of human and swine influenza virus for ferrets led Elkeles (1) to attempt the transmission of the human agent to swine. He found that very young pigs (2 to 6 weeks old) , developed a mild illness when the virus from man was given intranasally under light ether narcosis. At autopsy these animals sometimes showed scattered dark red bronchopneumonic areas of consolidation in the upper lobes of the lung. When cultures of either swine or human influenza bacilli were added to the virus at the time of its administration, the swine developed a more severe illness. The clinical picture was characterized by a low grade fever, apathy, loss of appetite, and sometimes cough. At autopsy varying degrees of bronchopneumonia were encountered. Virus, pathogenic for ferrets,

could be recovered from the pneumonic lungs. It thus appeared that Elkeles had produced a disease somewhat resembling swine influenza by the administration to young pigs of human influenza virus mixed with influenza bacilli of either human or swine origin. This observation made more credible the theory that swine influenza may have arisen as the result of the infection of swine in 1918 from human sources (2 - 4).

The question of the pathogenicity of human influenza virus for swine was of such importance that it seemed to warrant further investigation. The present paper reports our experience in the transmission of human influenza virus to swine.

Experimental - The Infection of Swine with Human Influenza Virus Alone

The PR 8 (Francis (5)) and WS (Smith, Andrewes, and Laidlaw (6)) strains of the human influenza virus were used in our experiments. No diflqculty was encountered in establishing either strain in swine 6 to 14 weeks of age. Older or younger animals were not tried. All animals were inoculated intranasally using the same methods employed in earlier studies of swine influenza (7, 8). The instillations were made with a Luer syringe without needle by pressing the tip of the syringe into the external nares. It was not necessary to anesthetize swine in order to induce infection with human influenza virus alone, although animals infected under ether narcosis exhibited somewhat more extensive pulmonary lesions at autopsy than those inoculated without anesthetic.

The WS virus was transferred 2, and the PR 8 virus 5, serial passages in swine before the experiments were discontinued. 10 per cent suspensions of infected mouse lung (5, 9) in physiological saline served as the source of virus for the first swine inoculation in each of the passage series and, after the first swine passage, similar suspensions of infected swine lung were used to inoculate swine of subsequent passages. 6.5 cc. of virus suspension was administered to each animal.

The disease produced in swine by human influenza virus was clinically very mild and, apart from a transient and indefinite malaise, no constant symptoms

were observed. It was sometimes difficult to be certain on antemortem examination that the animals had actually been infected. In most cases there was no significant elevation in temperature though a few had fever on the afternoon of the day following inoculation. 4 animals were kept under observation for 3 weeks or longer and made uneventful recoveries. 8 others were killed either by stunning and bleeding or by chloroforming on the 3rd or 4th day after inoculation and these exhibited the following picture at autopsy. There was a scattered, patchy, lobular atelectasis of one or more of the anterior lobes of the lung (Figs. 1 and 2). On cut section the involvement about the bronchi was seen to be more extensive than was apparent from the uncut surface. The involved lung was a reddish purple in color, beefy in appearance, felt rubbery, and was moist. A rather scant glassy tenacious mucous exudate could sometimes be pressed from the cut bronchi.

Histologically in involved areas of lung the alveolar walls were folded, greatly thickened, and infiltrated with large numbers of mononuclear cells (Figs. 3 and 4). Capillaries in the alveolar walls were dilated and packed with red blood cells. The partially collapsed alveoli themselves were either free of cells or contained at the most an occasional desquamated epithelial cell or a few lymphocytes. Polymorphonudear leucocytes were conspicuously absent. There was a pronounced perlbronchial round cell infiltration. The bronchial epithelium was, in places, fragmented and partially desquamated, and the cilia were either denuded or badly matted together. Some bronchi contained a scant, mixed lymphocytic and polymorphonuclear leucocytic exudate. Lymph channels in the

interlobular septa were sometimes dilated and the septa themselves thickened and loosely infiltrated with mononuclear cells.

The trachea, bronchi, and lungs of swine infected with human influenza virus were in most instances bacteriologically sterile. The few animals from whose respiratory tracts organisms could be cultivated showed no evidence that their disease had been modified by the bacterial contaminant.

Influenza virus was demonstrated in the lung lesions of all passage swine by the inoculation of mice (5, 9). No evidence was obtained that serial transmission of the virus in swine modified its pathogenicity for mice. Also, the pathogenicity of the virus for swine appeared to remain constant through the number of serial passages to which it was submitted. It was of interest that the areas of swine lung that appeared free of lesions were also free of virus.

The symptoms and pathology observed in swine infected with human influenza virus were indistinguishable from those of the filtrate disease (10) produced in swine by the intranasal administration of swine influenza virus alone.

The Infection of Swine with Human Influenza Virus and H. influenzae suis

Sixteen swine have been inoculated intranasally with mixtures of human influenza virus and the bacterium, H. influensae suis (11). These animals were included in two serial passage experiments. One series, started with virus from infected ferret lung (6), was continued for 5 passages, and the other, initiated with virus from infected mouse lung, was carried through 3 passages in swine before being discontinued. 6.5 cc. of 10 per cent virus suspension to which had been added 0.5 co. of a 24 hour horse blood culture (11) 1 of H. influenzae suis, strain 18, was given intranasally to each animal. It was known from other experiments conducted at the same time as those under discussion that this culture of H. influenzae suis, in combination with swine influenza virus, was capable of producing characteristic influenza in swine (10).

In 11 of the 16 swine inoculated with mixtures of human influenza virus and H. influenzae suis the resulting illness was definitely more severe than that caused by the virus alone. This enhancement was evident both clinically and at postmortem examination. The temperature reactions were similar to those seen in swine influenza although nsuaHy the fever was less persistent. Seldom was it maintained for longer than 3 days, whereas 5 to 6 day fevers are not uncommon in swine influenza. Fever, while it lasted, was high, exceeding 41°C. on 1 or [...]

[...]

Summary

Swine inoculated intranasally with human influenza virus alone develop an ill defined, mild, and usually afebrile illness of short duration. At postmortem the anterior lobes of the lungs of such animals contain scant, scattered areas of lobular atelectasis. Transmission of the virus for 5 serial passages through two groups of swine

failed noticeably to enhance its pathogenicity for this species. The disease produced in swine by infection with human influenza virus alone is indistinguishable clinically and pathologically from that caused by infection with swine influenza virus alone. Transmission of human influenza virus from swine to swine by contact succeeded in only one of four attempts.

Swine inoculated intranasally with a mixture of human influenza virus and H. influenzae suis usually develop a febrile, depressing illness similar to mild swine influenza. The pneumonia encountered in such animals at autopsy is similar to but less extensive than that seen in swine influenza. In some animals H. influenzae suis fails to become established and the disease then seen is identical with that caused by human influenza virus alone.

The human influenza virus recovered after 5 serial transfers in swine was immunologically the same as that with which the experiments were begun.

- Doctoral advisor : Francis Gilman Blake
- Doctoral students : [**Dr. Jonas Edward Salk (born 1914)**]

Thomas Francis Jr. (July 15, 1900 – October 1, 1969) was an American physician, virologist, and epidemiologist. Francis was the first person to isolate influenza virus in the United States, and in 1940 showed that there are other strains of influenza, and took part in the development of influenza vaccines.

Howe, David Bodian, [**Dr. Jonas Edward Salk (born 1914)**], Eleanor Roosevelt and Basil O'Connor.*[1]
[HK006Q][GDrive]

Life

Francis grew up in New Castle in western Pennsylvania, graduated from New Castle High School in 1917 and Allegheny College on scholarship in 1921, and received his medical degree from Yale University in 1925. Afterwards he joined an elite research team at the Rockefeller Institute, first doing research on vaccines against bacterial pneumonia, later he took up influenza research. He became the first American to isolate human flu virus. From 1938 to 1941 he was professor of bacteriology and chair of the department of the New York University College of Medicine.

In 1941 he was appointed director of the Commission on Influenza of the Armed Forces Epidemiological Board (AFEB), a position which enabled him to take part in the successful development, field trial, and evaluation of protective influenza vaccines. Later that year Francis received an invitation from Henry F. Vaughan to join the newly established School of Public Health at the University of Michigan.

At the University of Michigan, Francis established a virus laboratory and a Department of Epidemiology that dealt with a broad range of infectious diseases. When [**Dr. Jonas Edward Salk (born 1914)**] came to that university in 1941 to pursue postgraduate work in virology, Francis was his mentor and taught him the methodology of vaccine development. During this time at the University of Michigan, Francis and Salk, along with other researchers, deliberately infected patients at several Michigan mental institutions with the influenza virus by spraying the virus into their nasal passages.[2] Salk's work at Michigan ultimately led to his polio vaccine.

In 1947 Francis was awarded one of the first Michigan distinguished professorships, the Henry Sewall University Professor of Epidemiology. In addition to his work at the School of Public Health, Francis joined the pediatrics faculty at the University's Medical School.

As director of the University of Michigan Poliomyelitis Vaccine Evaluation Center, Francis designed and led an unprecedented $17.5 million nationwide field trial to test the vaccine. Conducted by a staff of more than 100 people from the University of Michigan, the year-long trial involved 1.8 million children in the U.S., Canada, and Finland and an enormous network of community volunteers. The results of the study were announced in Rackham Auditorium of the University of Michigan on April 12, 1955, and signaled an era of hope and success in combating infectious diseases and, more broadly, in the development of large-scale efforts for the good of society.

In 1933, Francis married Dorothy Packard Otton, and they had two children. He died in 1969 in Ann Arbor, Michigan.

Quotation (Francis on his work): "Epidemiology must constantly seek imaginative and ingenious teachers and scholars to create a new genre of medical ecologists who, with both the fine sensitivity of the scientific artist, and the broad perception of the community sculptor, can interpret the interplay of forces which result in disease."[3]

Honors

- He was awarded the Medal of Freedom in 1946

- He was awarded the Medal of Freedom in 1946.
- He was honored with the Lasker Award in recognition of his distinguished contribution to the knowledge of influenza in 1947[4]
- He was elected to the Polio Hall of Fame, which was dedicated in Warm Springs, Georgia in January 1958 in recognition of his polio research work.
- Posthumous recognition in 2005 by dedicating the Thomas Francis Jr. Medal in Global Public Health at Michigan[5]

Donald Sharp "Don" Fredrickson (August 8, 1924 – June 7, 2002) was an American medical researcher, principally of the lipid and cholesterol metabolism, and director of National Institutes of Health and subsequently the Howard Hughes Medical Institute.[1]

Biography[edit]

Fredrickson was born in Canon City, Colorado. His father was a county judge and the owner of Fredrickson Brown, an independent insurance agency. After high school he commenced medical school at the University of Colorado, but completed his studies at the University of Michigan after being transferred there by the army. During a cycling trip in the Netherlands he met his future wife, Priscilla Eekhof, and they married two years later. They would have two sons.[1]

Between 1949 and 1952 he worked as a resident and subsequently as a fellow in internal medicine at the Peter Bent Brigham Hospital (now part of Brigham and Women's Hospital) in Boston. Much of his published work from this period is in the field of endocrinology. Subsequently he spent a year in the laboratory of Ivan Frantz, a cholesterol biochemist, at Massachusetts General Hospital.[1]

Lipid research[edit]

In 1953 he took up a post at the National Heart Institute, part of the National Institutes of Health in Bethesda, Maryland. Initially, he worked with protein chemist and Nobel laureate Christian B. Anfinsen, and subsequently (with Daniel Steinberg) developed an interest in the metabolism of cholesterol and lipoproteins, as well as related medical conditions such as Niemann-Pick disease. His group identified Tangier disease (HDL deficiency)[2] and cholesteryl ester storage disease, two inborn errors of cholesterol metabolism. He played a prime role in the identification of several apolipoproteins (proteins that characterise the nature of a blood lipid particle): APOA2, APOC1, APOC2 and APOC3.[1]

In 1967 Fredrickson co-authored the paper that described the classification of lipoprotein abnormalities in five types, depending on the pattern of lipoprotein electrophoresis; this became known as the Fredrickson classification.[3] It was adopted as the mondial standard by the World Health Organization in 1972.[1] His group also conducted the first trials of pharmacological cholesterol reduction in the prevention and treatment of cardiovascular disease.[1]

Textbooks[edit]

From 1960 he worked, with John Stanbury and James Wyngaarden, on several editions of the encyclopedic medical textbook *The Metabolic and Molecular Bases of Inherited Disease*.[1][4]

Directorships[edit]

Fredrickson at NIH in 1976

Apart from his work in research, Fredrickson was involved in the management of the NHI from an early stage. He was clinical director from 1960 onward and from 1966 general director of NHI. In 1974 he left the NHI (then already the National Heart and Lung Institute) to head the Institute of Medicine of the National Academy of Sciences. Nine months later he was asked by president Gerald Ford to become head of the National Institutes of Health, a task he commenced on 1975-06-01.[1]

One of the main issues that occupied him was the controversy over research involving recombinant DNA. Already in 1973 there had been scientists urging a ban on such research for environmental reasons. Fredrickson released a guideline that restricted release of genetically modified organisms into the environment, and called into existence a body that would advise on these matters and had to approve any NIH research involving recombinant DNA technology. Fredrickson is credited with restoring confidence in this form of research.[1] A second controversy involved congressional control over the NIH in general. Some feel that Fredrickson's decision to resign from his position in 1981 was fuelled by these controversies.[1] The recombinant DNA controversy was the subject of a book published by Fredrickson in 2001.[5]

After 1981 Fredrickson was scholar-in-residence at the National Academy of Sciences for two years, but in 1983 he was recruited to become the vice-president of the Howard Hughes Medical Institute, a privately run health research charity. At that stage, the institute was still the owner of the Hughes Aircraft Company, and Fredrickson participated in the negotiations that led to the sale (for $5.2 billion) to General Motors. He made substantial changes to the institute's research programme. He resigned in 1987 when the trustees of the institute discovered that there had been financial malversations under his presidency.[1]

Later years[edit]

Fredrickson returned to the NIH, resuming work on lipid diseases and writing for the National Library of Medicine. He participated in the genetic elucidation of Tangier disease, which he had himself described in the 1960s.[1][6]

He was personal physician to Hassan II of Morocco, and had a close personal friendship with the king until the latter's death in 1999.[1]

He was found dead, face-down, in his swimming pool in 2002. He is buried in Leiden, the Netherlands.[1]

His papers are held at the National Library of Medicine in Bethesda, Maryland.[7]

IF everyone in the world were like Dr. Anthony S. Fauci, there would be no need for Prozac. By any sensible reckoning, the man should be wilting around the edges. He has been at the center of the AIDS tornado since the epidemic began, serving as the director of the National Institute for Allergy and Infectious Diseases and the Government's Office of AIDS Research, which together oversee much of the AIDS-related research carried out around the nation.

Apart from his official credentials, he has been the most visible and quotable spokesman on every medical, epidemiological and social aspect of the disease, the de facto AIDS czar until the appointment last year of Kristine Gebbie as the czar de jure to the President.

The institute that Dr. Fauci runs at the National Institutes of Health not only controls about 40 percent of the Federal budget designated for AIDS, but also the money for studies of all the other infectious diseases afflicting the nation's citizenry, from tuberculosis to hanta virus infections. In addition, Dr. Fauci runs a laboratory on the Bethesda campus that does basic research on how the human immunodeficiency virus gradually disassembles the immune system, studies that lately have yielded insights into AIDS and buffed his luster as something more than a superbureaucrat.

Even among scientists, where work addicts are commonplace, Dr. Fauci, 53, is renowned as a truly hard worker. This is the bookend refrain for any discussion about him, an emphasis first and last on how astonishing it is that he manages to work 16 hours a day, day after day, year after year.

And he is working on a plague for which, scientific revelations about the virus notwithstanding, there have been depressingly few advances to help human patients. There is no vaccine in sight. There are no new drugs in the pipeline, and the antiviral drugs that do exist, like AZT, DDI and DDC, have been shown to be of questionable benefit in prolonging life.

- **Refer someone to The Times.**

They'll enjoy our special rate of $1 a week.

The epidemic continues to spread relentlessly across the globe. It has killed 210,000 people in the United States alone and eviscerated entire subcultures, including the arts community, which gives depth and resonance to the rest of the population. It is a new disease that has turned the world old overnight.

Dr. Fauci has been bounced around by activists in the AIDS community, denounced one day, embraced as comrade and hero the next. Most recently, activists have put his pride and ego to the test by persuading Congress that the Office of AIDS Research should be removed from his jurisdiction and given a full-time director of its own, who is expected to be named any day now.

Yet Dr. Fauci looks the same as he has looked for years, a compact, meticulous, supremely confident, unflappable bullet of a man, at once compassionate and hard-driving, gentle and ferocious. The man with the natty suits, hearty handshake and resilient Brooklyn accent.

Doesn't he ever doubt himself, or his ability to make a real dent in the disease? Doesn't he ever get tired or depressed or demoralized, or just overwhelmed by it all?

"If you're asking whether I have fears, pain and anxieties, yes, of course I do," he said. "That's a natural human thing. But do you mean, have I ever let them interfere with my responsibilities, or get in the way of my work? No."

Not once? Not one single lapse?

"Never," he said firmly. "I have the self-discipline not to let that happen." As though to make a point about his purposefulness, he jumps up from the couch where he had been sitting in his office and strides over to his desk. Two of the walls in the large room are covered practically to the ceiling with his plaques and awards and degrees real and honorary.

"To take on what I take on, you have to be very organized and energetic," he said. "I have made enormous sacrifices in my family and personal life. But I don't want to be praised or pitied for this. I do it because this is what I want to do." Optimistic About AIDS Treatment

He is religiously organized, his day blocked out in chunks for his administrative duties, his rounds to see AIDS patients in the research hospital at the institutes, his lab meetings, his discussions with scientists in his group. He runs seven miles every lunch hour regardless of the brutality of the weather. He sets aside every Saturday evening and all day Sunday for his family, a commitment that is essential if he is to see his three young daughters while they are awake.

And perhaps his is the attitude that must prevail in the plague years: not robotic, because robots break down, but calmly obsessive and matter-of-fact. His pragmatism may be his strongest suit, the impulse that ultimately overrides what some say is his sensitivity and a tendency to take things personally. When told that Harold Varmus, the new head of the N.I.H., had described him as "running his institute with an iron fist," Dr. Fauci made a point of asking every subordinate he encountered that evening whether the description was accurate. Most giggled nervously and said variations of, well, yes, but you're always fair.

Dr. Fauci is a man of many opinions, the most essential of which are scientific ones. And it is in the scientific arena that he is most optimistic, although cautiously so. "We've been on a roller-coaster ride for years, from great enthusiasm to despair," he said. "Recently, there was a sense that the sky was falling, when it became clear that giving people AZT early in the course of the disease doesn't give significant benefit.

"But despite the feeling of a roller- coaster ride," he added, "the science will march ahead to the time when we'll have an enduring solution or a therapeutic intervention. And it all will be based on a step-by-step understanding of the immune pathogenesis" that is the hallmark of AIDS.

Continue reading the main story

Dr. Fauci has lately devoted most of his attention to dissecting those steps. In widely praised work published last year, Dr. Fauci and his colleagues reported that the human immunodeficiency virus never really lies latent in the body, but rather is sequestered in the lymph nodes, where it disturbs many threads of the body's densely interwoven immune system. It overexcites some immune signaling pathways, while eluding the detection of others. And though the main target of the virus appears to be the famed helper T-cells, or CD-4 cells, which it can infiltrate and kill, the virus also ends up stimulating the response of other immune cells so inappropriately that they eventually collapse from overwork or confusion.

He proposes that one possible approach to treating infection with H.I.V. is not to focus on clearing every last viral particle from the body, but rather to figure out exactly how the immune system comes unstrung, and then replace or compensate for those signaling pathways thrown out of whack. For example, he and his colleagues have learned that AIDS patients suffer from a defect in the arousal of an immune signaling molecule called interleukin-2. In trials now under way, they are giving patients IL-2 in carefully calibrated doses designed to recapitulate the activity of a normal immune system. They have found that the patients' T-cell counts improve with the treatment, but they now must determine whether that rise in cell number translates into an improvement in symptoms of the disease; for example, whether the interleukin treatment causes Kaposi's sarcoma lesions to shrink.

Dr. Fauci and his colleagues are also studying the immune systems of 10 people who are members of a small and fortunate minority: they have been infected with H.I.V. for 12 years or longer, yet they have not progressed to showing any symptoms of AIDS. "We think the real clues to the disease are with these people," said Dr. Fauci. "What is it about them that's different? The architecture of their lymphoid tissue appears to be preserved compared to those who progress, and we're trying to see what is responsible for that preservation." 'A Consummate Politician'

Dr. Fauci's current fixation on his science is what keeps him from getting excessively rankled by recent struggles over who will have the greatest hand in shaping the course of AIDS research. The new legislation that reorganized the Office of AIDS Research was whisked through Congress last spring so easily that even the activists who had promoted the change were surprised. Under the plan, the office has been turned into a strong force within the N.I.H., one with more personnel and power than it had under Dr. Fauci's rule. Whoever is chosen as director will coordinate the entire $1.3 billion budget for AIDS research, keeping track of all AIDS-related programs and clinical trials that currently are run by 21 different institutes at the N.I.H.

Dr. Fauci and many other scientists had vigorously opposed the reorganization of the Office of AIDS Research, arguing, among other things, that it would emphasize a trend toward excessively targeted science at the expense of untethered basic research.

Dr. Fauci soft-pedals the degree to which his pride has been wounded, but friends and colleagues said they sensed his frustration. "It might be a relief for him to get some of the pressure off his back," said Dr. Donald Frederickson, a former director of the N.I.H. and one of Dr. Fauci's old friends. "It's enough to do to run his own institute, and his lab is now going full steam. But nobody likes to be downgraded from the position of national importance that he's had."

Those who know Dr. Fauci said there is no chance he will fade into the scenery. "His role will change, but anybody coming into the office would be a fool not to take advantage of Tony's leadership skills," said Derek Hodel of the AIDS Action Council, a Washington-based lobbying group for AIDS organizations. "He's a consummate politician and a fine scientist, and it's clear he's going to continue to play a central role in AIDS research."

Continue reading the main story

Dr. Fauci, say friends and co-workers, has always been like a child's punching bag, which can be pushed over but will always pop back up for more. For the first eight years of his directorship at the allergy and infectious diseases institute, he worked under Republican Administrations reluctant to focus their attention on AIDS. He has been the repeated target of activists furious at what they perceived to be bureaucratic indifference and timidity -- and he has also been their greatest friend.

"I call him murderer or hero, depending on the week," said Larry Kramer, a playwright, journalist and the most resilient bullhorn of all activists. "It's been such a complicated relationship." That complexity was reflected in Mr. Kramer's latest play, "The Destiny of Me," in which Dr. Fauci is portrayed, with scant attempt at disguise, as Dr. Anthony della Vida, or Dr. Life, a chipper physician-researcher who accepts descriptions of himself as "a son of a bitch of Hitler" and a "scientific fraud" from his churlish AIDS patient -- modeled after Mr. Kramer -- yet who tries with equal fortitude to keep that patient alive. Dr. Fauci attended the play's opening. Assailed and Beloved by Activists

"I've worked with Dr. Fauci for years, and during that time we've have a combination adversarial and collaborative relationship," said Mr. Hodel. He and other activists give Dr. Fauci tremendous credit for lending his support several years ago to the idea of a parallel track, of allowing experimental drugs to be made available to AIDS patients even as the compounds are tested in clinical trials. They also appreciate that he has spoken out against mandatory H.I.V. testing of health care workers, and has opposed barring immigrants who carry the virus. They said he has been willing to listen to members of the AIDS community and to persuade grudging researchers and pharmaceutical companies that they should do the same.

Yet for every cheer there is a hiss. Some activists recall bitterly that during the Reagan and Bush Administrations Dr. Fauci defended research budgets that they thought were dreadfully inadequate. Some say he is a great scientist but a poor administrator; others insist that he is too smooth a bureaucrat to make any scientific headway. Scientists also have criticized Dr. Fauci for capitulating to the demands of activists too readily.

And through it all, Dr. Fauci accepts the criticisms, and he accepts that someone must absorb the anger and terror that AIDS has spawned, so why not somebody of strong vertebrae who was raised on the streets of Bensonhurst? "I was on a C-Span program a couple of months ago with Tony, and I attacked him for the entire hour," said Mr. Kramer. "He called me up afterwards and said he thought the program went very well. I said, 'How can you say that? I did nothing but yell at you.' He said, 'You don't realize that you can say things I can't. It doesn't mean I don't agree with you.' "

Dr. Fauci claims he does not take the intermittent blasts personally. "That's the activist mode," he said. "When there's a disagreement their tendency is to trash somebody. But I know that when Larry Kramer says the reason we're all in so much trouble is because of Tony Fauci, he's too smart to believe that.

"I don't want them to change or compromise that mode," he added, "as long as they don't ask me to change my opinions."

"I'm totally obsessed by this problem," said Dr. Fauci. "I'm going to finish this job." That is why he turned down an offer to take over the entire National Institutes of Health several years ago, he said, and that is why he does not mind ceding control over the Office of AIDS Research now.

"I think Tony believes he will find a cure for AIDS," said Mr. Hodel. "I hope he's right. And I hope a lot of other people are given the opportunity to believe that as well."

Dr. Edward Jacob Freeman (b1851)

Born - December I8, I851 [HB0021][GDrive]

Source: Encyclopedia_of_Pennsylvania_Biography [HB0021][GDrive] page 355

DR. EDWARD JACOB FREEMAN, who for many years was engaged in the practice of medicine in Northampton county, but is now superintending private business interests, was born in Easton, Pennsylvania, December I8, I851, his parents being Dr. George W. and Matilda (Seip) Freeman. His paternal grandparents were Jacob and Susan (Butz) Freeman. The village of Freemansburg was named' in honor of the family. The family had its origin in England, and representatives of the name emigrated to this country in the early part of the seventeenth century, and they owned considerable land in Bethlehem and Lower Saucon township.

Dr. George W. Freeman was born in 1832. He obtained his early education in the public schools of Freemansburg and of Bethlehem, and afterward continued his studies in a private school conducted by Professor Vandeveer, at Easton, Pennsylvania, where he prepared for college. In 1849 he entered the University of Pennsylvania, but previous to this time he read medicine under the direction of Dr. C. C. Field of Easton, who was his preceptor for three years. He was graduated from the University of Pennsylvania, in 1852, and then returned to Freemansburg, where he entered upon the practice of his chosen profession, being thus engaged up to the time of his death, which occurred May 16, I898. He was prominently connected with the Northampton County Medical Society. He married Matilda Seip, a daughter of Edward Seip, of Easton, and their marriage was blessed with four children, of whom Edward Jacobs is the eldest, Mary Ellen, the second, is the wife of G. W. Bachman, and they have five children: Estella, Jennie, Ralph, Laura and Roland. Walter S., who is a practicing physician of Philadelphia, married Jane Unangst, and they have four children: Eugene, Mabel, Edith and George. Emma Adelia, the youngest child of George VV. and Matilda (Seip) Freeman, died in infancy.

Dr. Edward J. Freeman, who was born in Easton, December 18, I851, attended the public schools in his early youth, and afterward became a student in the Swartz private academy at South Bethlehem. He next entered Lehigh University at Bethlehem, where he remained for a year and a half, and in the winter of 1869 he matriculated in the University of Pennsylvania as a student in the medical department, and was graduated with honors in the class of 1873. Having thus become well prepared for the responsible duties of his profession, he took up his abode in Freemansburg, and associated himself in practice with his father, being thus engaged until I877. The business relation between them was then dissolved, and Dr. Freeman of this review began practicing alone. He continued the work of ministering to the needs of suffering humanity until 1898, when he put aside the cares of the medical profession in order to give his super vision to his investments and private business interests.

Dr. Freeman is an active worker in the Re formed church and has been closely identified with its progress and development. The only secret order with which he is connected is Huldah Lodge, No. 364, Knights of Pythias. He married Miss **Emily J. Knecht**, a daughter of John Knecht, of Shimersville, now deceased. Her mother bore the maiden name of Eliza Reigel, and by her marriage had four children, namely: 1. Arabella, who married Dr. J. J. Detweiler, by whom she has six children—Elizabeth, William, Fred. Albert, John and Edith. **2. Emily. the wife of Dr. E. J. Freeman**. 3. Howard, who married Laura Walters, and has two children—Laura and John. 4. Anna, who completes the Knecht family. To Dr. and Mrs. Freeman have been born four children, but'Anna Elizabeth is the only one now living, the others having died in infancy.

Dr Edward Jacob Freeman (December I8, I851) - Married - Emily J Knecht (daughter of John Knecht and Eliza Reigel ... married February 2, 1841,)

4 children, but 3 died in infancy - only Anna Elizabeth (Freeman) lived

Source: Encyclopedia_of_Pennsylvania_Biography [HB0022][GDrive] page 1820:

KNECHT, John,

Man of Great Enterprise.

The Knecht family of Northampton county descends from John Jacob Knecht, who sailed from Rotterdam in September, 1734, and later settled in Williams town ship, Northampton county. The line of descent to Howard R. Knecht, of Shimersville, is through Jonathan George Knecht, son of the founder, his son John, his son John (2), father of Howard R. Knecht.

In 1841, John Knecht settled in Shimersville, Pennsylvania, where he became prominent in business and was one of the substantial men of his day, succeeded in 1890 by his son, Howard R. Knecht, who is now (1914) the leading business man of the town. The records of father and , son cover a period of seventy-three years During this entire period the chief industry of the town has been the mills now operated by Howard R. Knecht, under the name of John Knecht's Son.

John (2) Knecht was born in Williams township, Northampton county, August 5, 1814, died February 22, 1891. He was left fatherless when ten years of age, his uncle Aaron Knecht supplying a father's care and training him in habits of thrift and industry—traits that ever characterized his later life. He was educated in a public school held in the spring house near Black Horse Tavern, on the Delaware, two and a half miles below Easton. He grew up on his uncle's farm, later learning the carpenter's trade, which he followed until twenty-one years of age. He then went south, engaging in railroad construction on the line between Raleigh and Gaston, North Carolina, re turning to Williams township in 1830 and was there married in 1841. Soon after that event he took possession of the old grist mill at Shimersville, built in 1735 by Nathan Irish. Then as now, this mill was the milling center for a large district, the old records showing that in 1743 the Moravians at Bethlehem petitioned the court to open a road from that town ttotthet Saucon mill, which was done. The old mill had passed through several hands before coming to John Knecht in 1842. Mr. Irish sold it to John Cruikshank, of Philadelphia; John Currie, his son-in-law, was the next owner, he selling mill, stone house and all land connected therewith, to John Shimer, who in 1816 erected a new mill close by the old one. Samuel Leidigh became the next owner, and Benjamin Reigel the next, he purchasing the property in 1836, selling it in 1842 to his son-in-law, John Knecht, who operated it until 1890, when the mill management was turned over entirely to his son, Howard R. Knecht, its present owner. In addition to his large milling business, and the management of the large estate he had acquired. John Knecht was interested with his longtime personal friend, Judge Asa Packer, the projector and builder of the Lehigh Valley railroad. He was in hearty sympathy with Mr. Packer in his plans, rendering him important assistance in many ways, and after the completion of the road was a director for many years. He not only favored, encouraged and assisted in the construction, but as a director added strength to the management of those early years of railroads. He pos sessed not only the friendship but the esteem and confidence of Mr. Packer, and which he always retained. With keen business foresight, Mr. Knecht saw the great benefit the Valley might realize from the building of the railroad, and after its completion he inaugurated the movement that resulted in the formation of the Bethelehem Iron Company. The latter was formed in association with Augustus Wolle, Charles W. Rauch, Charles B. Daniel and other capitalists, John Knecht being a director of the company from its inception in 1859 until his death in 1891. He was also connected with other prominent companies, including the Northampton Iron Company, which he organized in 1872, and of which he was president. This company built a large furnace near Freemansburg, later operated by the Bethlehem Iron Company. He was also a director of the Easton National Bank, and held many offices of trust, serving as executor, administrator or trustee of many large estates. He was very generous, and by advice and material assistance started many a man on the road to prosperity. He was a Democrat but would never consent to accept public office, declining even a congressional nomination. He was a faithful member of the Reformed church and in every relation in life was true, honorable and up. right.

John Knecht married, February 2, 1841, Eliza E., daughter of Benjamin and Elizabeth Riegel. She survived her husband less than six months, dying July 4, 1891. On February 20 of that year Mr. and Mrs. Knecht celebrated their fiftieth anniversary of their wedding. A pleasant and unusual feature of the occasion was the presence of the groomsman and bridesmaid of fifty years earlier. The guests were numerous, many of the officials of the Lehigh Valley railroad and of the Bethlehem Iron Company honoring their old business associate by their presence, as did many of his oldtime Easton, Bethlehem and country friends. Twenty days later the death of John Knecht occurred, followed in six months by that of the widow. Children: Arabella, married Dr. J. J. Detweiler, of Easton; Emily, married Dr. E. J. Freeman, of Freemansburg; Annie; Howard R., of whom further; Sarah, married Dr. R. H. Sheppard, of Phillipsburg, New Jersey; John and Benjamin, the latter dying in infancy.

Howard R. Knecht was born at Shimersville, September 4, 1856. He was educated in the public schools and at Nazareth Hall, graduating from the latter with the class of 1876. He at once be came his father's assistant and on attain ing his majority was admitted a partner in the milling business. The old stone mill built in 1816 has been rebuilt, enlarged and otherwise improved, and is about on the site of the original Nathan Irish mill built in 1735. In 1885 it was completely modernized and converted into a roller mill, and is one of the noted flouring mills of Pennsylvania, its pro ducts on sale in all principal Eastern Pennsylvania cities and in other large cities in the east. In 1890 John Knecht turned over to his son the entire management of the plant, and in his will bequeathed the grist mill, saw mill, stone house (the family residence), tenant houses, large tracts of land and other property, Howard R. Knecht has ever since retained management of the flouring mill, which is a very important and prosperous industry, and has been active in many of the business enterprises that distinguish Northampton county. He is a director of the Easton National Bank and in business affairs has displayed the same energy and ability that distinguished the career of his honored father. He is most genial and courteous in manner, has a host of warm friends, and holds a high position in his community. He is a Democrat in politics and influential in local party affairs. He is a member of the Reformed church of Freemansburg, and a trustee of Allentown College for Women. He was a juror in the famous Lincoln National Bank case, tried before Judge Butler in Philadelphia in 1890, wherein the cashier and another were accused of defrauding the bank of some $80,000.

A trait of Mr. Knecht's character is his interest in men of his time, and his methodical methods of preserving all cur rent notices of men of his day. When a lad of fourteen years he began making newspaper clippings of men and events, and this practice has followed all through life, the clippings being preserved by a systematic manner of arrangement. He is a veritable encyclopedia of information of this character, ari one appealed to for information when all other sources fail.

Mr. Knecht married, September 1882, Laurenti, daughter of Dr. B. C. Walter, of Farmersville. Children: **Florence Anna** and John Walter, two others dying in infancy. The family residence is at Shimersville, the family seat since the marriage of Mr. Knecht's parents in 1841.

- Nationality U.S.
- Alma mater Hunter College, Yale
- **Known for** Discovery of the Friend Leukemia Virus and Friend erythroleukemia cells, her research is still widely used today. It has become especially important in the field of HIV/AIDS research following her death.
- Scientific career Fields : Virology
- Institutions : New York University, Sloan-Kettering Institute for Cancer Research, Icahn School of Medicine

Charlotte Friend (March 11, 1921 – January 13, 1987) was an American virologist. She is best known for her discovery of the Friend leukemia virus.[1] She helped to establish the concept of the oncovirus, studied the role of the host immune response in disease development, and helped define modern retrovirology.

Family

Born and raised in New York, she was the youngest daughter of Russian Jewish emigrants, Morris Friend, a businessman, and Cecilia (Wolpin) Friend, a pharmacist. Friend had three siblings, consisting of two older sisters, Priscilla and Leafan, and a younger brother, Morris. When she was three years old, her father died, leaving her mother alone to raise four kids during the Great Depression. Her mother made sure all four of her kids would be able to finish their education, despite living on "Home Relief".[2]

Education and Research

She graduated from Hunter High School in 1940 and Hunter College in 1944.[3] The same year, she enlisted in the United States Navy.[4] As a lieutenant junior grade she worked in the hematology laboratory at U.S. Naval Hospital Shoemaker, California.[4] After the war ended she enrolled as a graduate student in the Department of Microbiology at Yale, where she received her PhD in 1950 with a thesis on the effects of sodium salicylate (aspirin) on antigen-antibody reactions[5] During her time at Yale she frequently traveled to New York to consult with Elvin Kabat and Michael Heidelberger, imminent immunologists at Columbia.[5] As a post-doc she worked in the Sloan-Kettering Institute under the direction of [**Cornelius Packard "Dusty" Rhoads (born 1898)**]. While at Sloan-Kettering, she met Cecily Cannan Selby, who had recently gotten her Ph.D. from the Massachusetts Institute of Technology. Both of them were interested in cell structure. Once, when looking through an unused electron microscope at the university, the two decided to look at fine

structures within the cells of the Ehrlich ascites carcinoma, a commonly used model for cancer research. What they found were structures in the cytoplasm of the cells which resembled those found in virus-infested cells. It was this incident that sparked Friend's interest in the possibility of cancer being caused by viruses, which became a main focus of her research. In 1966 she accepted a position as Professor and Director of the Center for Experimental Cell Biology at The Mount Sinai Hospital.

During her lifetime she was President of the Harvey Society, the American Association for Cancer Research and the New York Academy of Sciences and was the first woman to do so.[5] **Charlotte Friend also served as a member of the Advisory Committee for the [Special Virus-Cancer Program] of the National Institutes of Health and a member of the Board of Scientific Counselors of the Division of Cancer Cause and Prevention of the [National Cancer Institute].** Over the years, she served on a number of other advisory committees and on the editorial boards of several cancer and hematology journals. In all, she published 163 papers, 70 of which she wrote by herself or with one other author.

On her sixtieth birthday she was diagnosed with a lymphoma. She was insistent that her diagnosis remain secret, and continued to carry out her duties in her laboratory.[5] She died at the age of 65.

Legacy

- Cemented the knowledge that virus can be responsible for some types of cancer.
- Friend Virus is today the model to study viral leukemogenesis [6]
- Helped set the foundations for the study of retrovirus. Her techniques and characterisation studies allowed the future isolation of the human immunodeficiency virus.
- Observed the relation between liver cell damage and virus release and elevation of enzyme levels. Furthermore, she detected that increases in serum enzymes are also a feature of some human leukaemia, both still of vital clinical relevance today.[7]

"Charlotte Friend: A Pioneer in Cancer Cell Biology"

March 10, 2014

The story of **Charlotte Friend** is a true New York story. Friend was a noted microbiologist who made important contributions to the study of cancer. She was an advocate for women's rights and worked hard to improve the position of women in science.

Charlotte Friend was born March 11, 1921 in New York City, a city she loved. She received a Bachelor's degree from Hunter College in 1944 and then entered the Navy, where she was assigned to help direct a hematology laboratory in California. She left the Navy in 1946 and began graduate work in microbiology at Yale University. By the time she received her doctorate in 1950, Dr. Friend already had a position in the laboratory of [**Dr. Alice E. Moore (born 1908)**] at the Sloan-Kettering Institute in New York City. She stayed in New York for the rest of her life.

In 1956, Friend gave a paper at the annual meeting of the American Association for Cancer Research in which she stated that she had discovered a virus that caused a leukemia-like disorder in newborn mice. She was roundly criticized for bringing up what was considered to be the old canard of viruses causing cancer. Only [**Dr. Francis Peyton Rous (born 1879)**], who had made a similar announcement years before, spoke in her defense.

But the tide of change on this issue was turning in the face of mounting evidence. Dr. Friend had not been the only researcher whose work suggested this. By the next year, Friend had published her work in the prestigious Journal of Experimental Medicine, with the careful editing of Dr. Rous. She was also supported by Jacob Furth, who announced that he had studied Dr. Friend's pathologic material and that leukemia truly had been found to result from the new virus, which became known as the Friend leukemia virus.

Friend spent the following years investigating different aspects of the virus, as did many other researchers. She worked with various collaborators, often cooperating in international research efforts. **Dr. Friend loved to travel and formed many long-term friendships with colleagues in Europe. Her sabbatical years (1963 and 1975) were spent in laboratories in Australia, Israel, France and Italy.** She also attended many international meetings, often being one of only a handful of women scientists there. Still, while clearly social, she also maintained a very small laboratory staff and did not take on many graduate students to work with her.

Dr. Friend was very active in scientific associations and in outside professional activities such as grant reviewing and serving on editorial boards and advisory councils. In the 1970s, when many associations 'discovered' their female members in reaction to the women's movement, Dr. Friend was asked to assume leadership roles in several important organizations including: chairman of the **Gordon Conference (1973); member of the Board of Directors (1973-76) and president (1976) of the American Association for Cancer Research; president of the Harvey Society (1978/79); and president of the New York Academy of Sciences (1978).**

In 1966, Charlotte Friend left Sloan-Kettering to become the first Director of the Center for Experimental Cell Biology and a Professor at the still developing Mount Sinai School of Medicine. She was the first and only female full Professor in the School when the faculty was officially formed in 1966. She also served as a Professor in the Mount Sinai Graduate School of Biological Sciences. At Mount Sinai, she established her own laboratory, which in 1967 was endowed as the Mollie B. Roth Laboratory. Peyton Rous was the speaker at the event. Still, it was an unending struggle to find the funding to keep the lab well-staffed and well equipped, a situation that got steadily harder as federal funding began to shrink in the 1970s.

The decline in federal funds for basic research led Dr. Friend to write several protest letters to congressmen and others in power. This was a tact that she often took when a subject that mattered to her was threatened. She wrote about many things, including her support for Israel, her opposition to anti-abortion measures, and in defense of women's rights.

In 1971, Dr. Friend published another landmark paper, this one titled "Hemoglobin synthesis in murine virus-induced leukemic cells in vitro: Stimulation of erythroid differentiation by dimethyl sulfoxide." The co-authors were William Scher, J. G. Holland and Toru Sato. This paper described research on leukemia cells that had been made to differentiate, or take another step in the maturation process to become erythroid cells, thus stopping their cancer-like multiplication. This work pointed to a whole new area of cancer treatment: If instead of attacking cancer cells with toxic drugs, cancer cells could be targeted and made to mature, patients would be spared painful, sometimes deadly, and often ineffectual treatments. Research continues today in this field.

In all, Dr. Friend published 163 papers, 70 of which she wrote by herself or with one other author, a rare feat in modern biomedical science. Although diagnosed with lymphoma on her 60th birthday in 1981, she told few of her illness. She continued to go about her work with all the energy she had, writing grants, serving on committees, and working in the lab. Charlotte Friend died in January 1987.

In 1988, the Friend Papers were donated to the Mount Sinai Archives by Dr. Friend's family. The finding aid for the collection is here: http://library.mssm.edu/services/archives/archives_collections/charlotte.shtml For more information about Dr. Friend, contact the Mount Sinai Archives, a division of Academic Informatics &Technology of the Icahn School of Medicine at Mount Sinai.

Women Scientists Aid In Battle Against Cancer

By PATRICIA MCCORMACK

NEW YORK (UPI) — Womanpower is helping to establish beachheads in the battle against cancer.

The women scientists work in the laboratories, in the surgical rooms and at the bedside. They help to man the X-ray equipment and to teach other doctors about cancer therapy.

There are so many women engaged in cancer research these days that it is rare not to find a woman or two reporting at any scientific meeting where the battle against cancer is discussed.

Their gains are of such importance that a medical journal, "Medical World News," devotes an entire section of its publication for doctors to the women making news in cancer research.

Among women scientists cited are the following:

—Dr. Sarah Stewart, of the National Cancer Institute in Bethesda, Md. She recently made the first report of a new virus isolated from an infant with a malignant bone disease.

Has Major Findings

—Dr. Thelma Dunn, a research pathologist, has become one of a half-dozen recognized authorities on pathology of cancer in mice. Dr. Dunn also works out of the National Cancer Institute. She is credited with several major findings on the pathogenesis of cancer.

—Dr. Alice Moore, of Sloan-Kettering Institute in New York, has been growing human cancer cells in tissue culture for use in studies in the responses of volunteers, cancer patients and healthy individuals, to implants of such cells.

—Dr. Helen Wallace Toolan, one of Dr. Moore's colleagues in New York, operated a tumor farm that is producing large amounts of tumor tissue for cancer researchers all over the country. Out of this work it is hoped will come a key to help man better understand the ways nature fights cancer.

—Dr. Charlotte Friend, another of the scientists at Sloan-Kettering, discovered a virus which causes leukemia in adult as well as newborn mice. In addition, she brewed a vaccine which is highly effective in protecting mice against development of the disease.

From Cellist To Scientist

—Eleanor MacDonald was well on her way to becoming a professional cellist when science caught her fancy. The professor of viostatistics at the University of Texas M. D. Anderson Hospital and Tumor Institute in Houston has contributed a wealth of data on incidence and distribution of cancer. She still plays the cello, frequently with the university symphony.

—Dr. Mila Pierce, of the University of Chicago, has been devoted to the fight against leukemia. Today, partly because of her efforts, life can be prolonged for some leukemia victims.

—Dr. Ruth Graham, of the Roswell Park Memorial Institute, is known in association with her husband, Dr. John Graham, also a cancer research scientist. At one point they prepared vaccines from the patient's own tumor and have been testing it among terminal cancer cases.

—Dr. Relda Cailleau, associated resident biochemist at the Institute of Cancer Research, Univer-

Science Women Plan Bennington Event

BENNINGTON, Vt. — Putnam Memorial Hospital Institute for Medical Research will sponsor a medical symposium by noted women of science May 21 and 22, it is announced by Dr. Helene W. Toolan, director of the institute. Dr. Robert J. Slater, dean of the University of Vermont Medical College, will be program moderator.

Among the women scientists to attend the symposium will be Dr. Cecelie Leuchtenberger, professor, department of cytochemistry, Swiss Institute for Experimental Cancer Research of Lausanne, Switzerland; Dr. Charlotte Friend, associate member, Sloan-Kettering Institute for Cancer Research, New York; Dr. Bernice E. Eddy, chief, section on experimental virology, division of biologics standards, National Institutes of Health, Bethesda, Md.; Dr. Marguerite Sykes, assistant attending physician in the chemotherapy service, James Ewing Hospital and in department of medicine, Memorial Hospital, New York; Dr. Alice E. Moore, associate member Sloan-Kettering Institute for Cancer Research, New York,; and Dr. Ruth Sager, department of zoology, Columbia University, New York.

CHARLOTTE FRIEND

March 11, 1921–January 13, 1987

BY LEILA DIAMOND

IN 1956, at a meeting of the American Association for Cancer Research (A.A.C.R.) in Atlantic City, Charlotte Friend reported on the isolation of a virus that produced a fatal leukemia when inoculated into adult mice.[1] This was a time when the concept of viruses causing cancer was still viewed with extreme skepticism and the presentation of such data by an attractive young woman not long out of graduate school was met with disbelief and derision.[2] The

skepticism and the presentation of such data by an attractive young woman not long out of graduate school was met with disbelief and derision.[2] The audience's arguments against her findings were essentially the same as those Peyton Rous had heard in the early 1900's when he described a chicken tumor that was inducible by a transmissible agent. They argued, on the one hand, that the agent isolated was not a virus because it induced a malignant disease and, on the other, that the disease could not be a malignancy because it was virus-induced. However, the rapid confirmation of Friend's findings by the highly respected pathologist Jacob Furth led to a change in attitudes, and the scientific community soon realized that a virus which rapidly induces a malignant disease in adult mice provides an excellent model in which to study both viral oncology and the pathogenesis of neoplasia. Friend's virus became the primary system for research on viral

leukemogenesis and today it is acknowledged that no one who works on tumor viruses fails to be touched by the contributions of Charlotte Friend.[3]

Charlotte Friend was born in 1921 in New York City on Houston Street in lower Manhattan to parents who had immigrated from Russia as young adults. Her mother had been trained as a pharmacist but gave up any professional ambitions to raise a family. Friend's father, a successful businessman, died when she was three years old and her mother moved the family of four children to the Bronx in order to be near, and have the support of, other relatives. The substantial inheritance left by Friend's father was dissipated in the financial disaster of 1929, and the fact that the family had to accept "home relief" from the city in order to survive had a lasting effect on Friend. She always admired her mother for having been able to keep the family together during this period and for never letting the children doubt that they would complete their education.

While growing up, Friend took advantage of all the opportunities and wonders that New York offered. She became a very knowledgeable and avid devotee of all its cultural activities and successfully competed for admission to Hunter College High School, a part of the city's excellent, tuition-free education system for gifted students. After finishing high school, she attended Hunter College at night while working in a physician's office during the day.

Upon graduating in 1943, Friend enlisted in the United States Navy and was assigned to Midshipmen's School at Smith College from which she graduated as an Ensign in April 1944. She was soon promoted to Lieutenant j.g. and appointed second-in-command of the hematology laboratory at the naval hospital in Shoemaker, California. From early childhood she had thought about becoming a scien-

Cancel

tist, but this was her first real experience working in a laboratory and it convinced her that this was what she wanted to do with her life.

When the war ended, Friend had the financial support of the G.I. Bill of Rights to continue her schooling. She considered attending medical school but chose instead to enroll as a graduate student in the Department of Microbiology at Yale University. She already appreciated the importance of the advice and help of outstanding scientists for her research, and frequently came to New York City on weekends to consult with the eminent immunologists Elvin Kabat and Michael Heidelberger at Columbia. She received a Ph.D. from Yale in 1950 with a thesis on the effects of sodium salicylate (aspirin) on antigen-antibody reactions.

Friend was hired by Cornelius P. Rhoads, the director of what was then the new Sloan-Kettering Institute for Cancer Research, to work in the virus laboratory of Alice E. Moore. Rhoads was a very dynamic and enthusiastic individual who was extremely supportive of the members of his Institute, and he and Friend developed a strong mutual respect and admiration. At Sloan-Kettering, Friend met Cecily Cannan Selby, a recent Ph.D. from the Massachusetts Institute of Technology who was interested in cell structure. This was in the early days of electron microscopy and, when Selby found a microscope in the institute that was not being used, she and Friend decided to examine the fine structure of the cells of the Ehrlich ascites carcinoma, a transplantable tumor of mice that at the time was a commonly used model for cancer research. They unexpectedly observed cytoplasmic "particles of constant diameter in close array" that were similar to those seen in thin-sections of virus-infected cells,[4] and Friend then sought to determine whether these particles were biologically active.

She inoculated cell-free extracts of the ascites cells into newborn mice, following a procedure for transmission of a murine leukemia virus that Ludwik Gross had introduced a few years earlier.[5] The mice remained healthy over a fourteen-month period of observation but, when sacrificed and autopsied, six mice were found to have enlarged livers and spleens. Friend may have been surprised or dismayed to see what looked to be leukemia when she had inoculated an extract from carcinoma cells, but she was smart enough and curious enough to pursue the observation. Because newborn mice were unavailable, she injected cell suspensions from the enlarged spleens into adult mice and, within a few months, several had palpable spleens. By the third passage of either cell suspensions or filtrates of cell extracts, a high percentage of mice were developing leukemia with a latent period of only two to three weeks. The disease

Friend was seeing was very different from the lymphoma induced by Gross's virus: it was characterized by erythroblastosis and profound anemia; it was transmissible in adult noninbred mice; and the latent period before the first symptoms appeared was very short, the latter fact being powerful evidence that the transmissible agent was directly involved in the induction of the leukemia.

It is interesting to note that the cytoplasmic particles originally seen by Selby and Friend[4] were very different in size and structure from what was eventually proven to be the etiologic agent of Friend leukemia. In very elegant electron microscope studies done with Etienne deHarven, Friend found that her agent was a type-C virus[6] or what later became classified, on the basis of genomic structure, as a retrovirus (reverse transcriptase-containing RNA virus). Friend and deHarven were among the first to describe the life cycle of these doughnut-shaped viruses that "budded," a

Cancel

term suggested by their technician, from the cell surface of the leukemic cells.

Charlotte Friend never forgot the reception she and her new murine leukemia virus received at the 1956 A.A.C.R. meeting. Those who were present remember the dignity and courage with which she responded to the barrage of questions. She herself described the proceedings beautifully and in detail in her Presidential Address to the same society twenty years later.[2] She said that, despite warnings that serious objections would be raised, "by no stretch of the imagination could the violent storm of controversy that erupted after (her) presentation have been anticipated." She wondered why her friend who chaired the session did not use Rous's plea to "keep open minds" as an opportunity to cool the heated atmosphere and finally bring the session to a close. It is a mark of her character that she did not reveal the identity of that chairman in her Presidential Address and that they always remained the dearest of friends.

She was proud to have "emerge(d) unbowed—if a little bloodied"[2] from that experience and later was able to joke that those who persisted in their heretical beliefs about tumor viruses were being accused of having "either holes in their heads or holes in their filters." However, it may be that because of that rather traumatic experience, she never did develop into a strong, confident speaker. Throughout her career, whenever she had to give a talk, she was always very nervous and on edge in anticipation, and spent a great deal of time and effort writing out exactly what it was she wanted to say.

As co-editor of the Journal of Experimental Medicine and a strong supporter, Rous worked with Friend on the writing and editing of the first full-length publication describing the new virus.[7] He made many suggestions regarding docu-

Cancel

mentation, details and presentation, for he believed that she was "in a position to settle all doubts as concerns a virus causing leukemia in mice" if she presented what she had discovered "in a convincing way." The resulting publication provided the information the scientific community needed to accept the virus and to recognize its potential as an ideal model system with which to work.

The neoplastic nature of the disease induced was subsequently confirmed by the demonstration that transplantable solid tumors could be obtained with leukemic tissues from virus-infected mice. The leukemia was originally described as being not clearly granulocytic or monocytic, and it required extensive experimentation by Friend[8] and others to demonstrate that the primary target for malignant transformation was, in fact, an erythroid precursor. Development of the disease is now thought to involve at least two events: an early stimulation of erythropoiesis followed by a clonal event that results in transplantable, immortal erythroleukemia cells.

Following the discovery of the Gross and Friend viruses, a number of other RNA viruses that induced leukemia in mice and other species were isolated. What had originally been disbelief now turned to accolades and Friend began to be honored for her work. In 1962 she received the Alfred P. Sloan Award for Cancer Research and elected to use the money to travel around the world, spending three-month periods in research institutes in France, Israel and Australia working with such scientists as Andre Lwoff, Leo Sachs and Donald Metcalf. She has written that the trip was one of the most important experiences of her life, a major reason being that she fulfilled her long-cherished dream of working at the Pasteur Institute.

Despite all the work that has been done on Friend Leu-

Cancel

kemia Virus (FLV), we still understand very little about the molecular mechanisms by which it replicates and transforms. We do know that these mechanisms are extremely complex, so it is perhaps not surprising that over the years there have been disagreements and controversies regarding various aspects of the virus and the disease induced. The original virus isolate produced a leukemia associated with anemia but with its distribution to other laboratories and

passage from host to host, virus strains that produced polycythemia rather than anemia appeared. These strains caused formation of macroscopic foci of primitive erythroid cells on the spleen surface which appeared prior to the hepatosplenomegaly and could be quantitated. These were foci shown to be due to the presence in preparations of polycythemia-inducing strains of a defective spleen focus-forming virus (SFFV) that was competent for cell transformation but not for virus replication. Some investigators reported that only the polycythemic strains of Friend Virus induced leukemia in adult mice and that the anemic strain was effective only in neonates. It was suggested that, contrary to what Friend had originally reported, more than one virus was required for the pathogenesis of the leukemia (see reviews by Friend and Pogo [9] and Ostertag et al.[10]).

Friend always resisted that idea. Perhaps the cool reception she and the virus received originally had sensitized her to what she may have considered criticism of that early work and her powers of observation. She maintained that in her hands, even after twenty years of continuous passage, the original anemic strain of FLV (FLV-A, what she referred to as the wild-type or prototype virus), its host range, latent period and age dependence, and the syndrome that that virus induced were no different from what she had first reported. She insisted that FLV-A did not con-

Cancel

tain a defective, spleen focus-forming component[11] and that it was different from the virus strains others may have worked with subsequently. Her friend Frank Lilly once "tried to convince her that she should be proud to have discovered not just one but in fact two viruses that were totally unique in the mouse leukemia virus world. But she would have nothing to do with that idea."[12] And, indeed, others have shown that molecularly cloned FLV-A, with no SFFV component, induces an anemic form of an erythroproliferative disease in newborn mice which resembles the early stages of the disease induced by wild-type virus.[13] However, no one has yet explained the mechanism by which the profound anemia induced by such virus in either newborns or adults progresses to leukemia.

Most virologists have taken the position that the Friend Virus is a complex composed of a defective SFFV that depends on replication-competent FLV for its own replication, and that both viruses are required for production of fatal leukemia in adult mice. Friend always acknowledged that during in vivo passage, virus variants might have arisen through recombination with cellular elements or endogenous viruses and was not surprised that an agent such as SFFV was found in some virus stocks. However, she wanted to understand what might have happened in other laboratories, to discuss the various possibilities with other investigators, and to analyze the passage histories of the various virus strains. Those such as Arthur Axelrad and Frank Lilly who had the patience for such discussions remained good, lifelong friends. Others who wanted to get on with it and not be overly concerned with what might have happened to the virus years ago lost touch with her and, unfortunately, perhaps lost respect for her and her accomplishments as well.

Rhoads, the director of Sloan-Kettering, had died in 1959 and the subsequent administration was much more structured than his had been. Friend did not have the warm relationship with the new director that she had had with Rhoads and did not think she was getting the recognition she deserved. Thus, she was receptive when approached about joining the faculty of the new medical school being organized at Mt. Sinai Hospital in New York. In 1966 she accepted a position there as professor and director of the Center for Experimental Cell Biology. She requested, and received, an appointment that carried no teaching responsibilities. She wanted to be free to do what she did best and most enjoyed—research. The new laboratory was rather modest in size and amenities, and a somewhat isolated basic science entity. In her new position, Friend was responsible for raising essentially all the money needed for staff, supplies, equipment and support services. She became tightly locked into the federal grant system for the major requirements of the center which she headed, and in her later years, this became a tremendous burden that interfered with her enjoyment of doing research.

It was at Mt. Sinai that Friend made another seminal scientific contribution when she showed that cancer cells can be induced to differentiate by an exogenous agent and, thereby, lose their ability to multiply. She had observed earlier that the cells of the solid tumors produced by transplantation of leukemic tissue from Friend Virus-inoculated mice showed no recognizable erythroid elements, but that the erythroid nature of the cells could be demonstrated under certain conditions. For example, Friend and Cecilia Patuleia were able to establish permanent cell lines in culture from the tumor cells and to show that, even when cloned, these cultures consisted of undifferentiated

Cancel

cells and a small percentage of cells at various stages of erythroid maturation.[14,15] Their observation that these malignant cells were, in fact, capable of undergoing maturation was met with disbelief by some colleagues, even though the evidence should have been incontrovertible from their slides and photographs. "How can tumor cells that have been in culture for 6 months give rise to erythroblasts?" they asked. "There must be a contaminant." But again in the face of skepticism, Friend persisted, knowing that her cell system provided a superb "model for the study of leukemia as a disease resulting from a maturation defect."[16] She began to explore the possibility that the differentiation block in the leukemic cells could be removed

maturation defect.[16] She began to explore the possibility that the differentiation block in the leukemic cells could be removed.

This led her to the discovery that Friend erythroleukemia cells (FELC) in culture could be further stimulated to differentiate along the erythroid pathway by the addition of the solvent dimethyl sulfoxide (DMSO) to the medium.[17] I had been using DMSO as a solvent for hydrophobic compounds in cell cultures. I remember her phoning one day to ask about the concentration to use for an experiment she wanted to try. A few days later she called back, bursting with excitement about her cells being "pinkies, all pink, all pink." Her associate, Bill Scher, also remembers her running up and down the hall holding up the tube with the pellet of pink cells for all to see. She went on to show that, with some highly inducible erythroleukemia cell lines, the percentage of benzidine-positive (hemoglobin-producing) cells could be increased to over 85 percent, from a baseline of 1 percent, after four-five days in medium containing DMSO. Friend had clearly and dramatically demonstrated that expression of the malignant phenotype could be reversed experimentally.

Her observation was quickly reproduced and confirmed

Cancel

in other laboratories and it soon became apparent that the morphological and biochemical alterations that followed induction of differentiation were similar to those occurring in normal erythropoiesis. Friend cells became a widely used model for studying control of hemoglobin synthesis as well as for analyzing the overall regulation of gene expression in cell proliferation and differentiation.

This new discovery resulted in another exciting period of recognition for Friend. She was elected to the Hunter College Hall of Fame and received the Yale Science and Engineering Association Award. She was honored with the Dameshek Medal, the Prix Griffuel, and the Papanicolaou Award. In 1976 she was accorded the ultimate recognition by her peers, election to the National Academy of Sciences.

In the late 1960s a young Italian pathologist, Giovanni Rossi, spent several years working in Friend's laboratory. They became close scientific colleagues and devoted friends, and in 1977 when she had the opportunity to spend a sabbatical year abroad, she went to Rome where Rossi had settled. She had a wonderful time working at the Italian National Research Council Laboratory where Rita Levi-Montalcini was director. The two women had great respect for each other and when Friend left Rome, Professor Levi-Montalcini gave her an engraving entitled "The Spiral of Archimedes," done by her twin sister, Paola.

Charlotte Friend first learned that she had lymphoma on her sixtieth birthday in 1981. She told very few people and was adamant that others not know. She did not want those who might be reviewing her grants or manuscripts to be influenced one way or the other. Despite undergoing extensive, debilitating therapy, she continued to spend time in the laboratory, to write, to attend meetings and discuss work with other people, to send out manuscripts and grant

proposals and, when necessary, to argue with editors, reviewers and administrators. She did everything she could to keep her laboratory afloat, always with the hope that it would be perpetuated if she were no longer around. However, it had always been important to her that she stay on top of everything going on in her laboratory. She had preferred to do things herself and not to turn projects over to others. And so, she had never built up an active group of young investigators studying problems of interest to her. In the end, there was no one to maintain the center and continue her work.

One of Charlotte Friend's last public appearances was at Brandeis University, where she received an honorary Doctor of Science degree in May 1986. She was very proud to have been selected for this honor and left her hospital bed to make the trip to Waltham, Massachusetts. She participated in the commencement procession in a wheelchair and, despite a broiling sun, stayed for the entire lengthy ceremony. She died eight months later on January 13, 1987.

During the height of her career, Charlotte Friend was perhaps one of the most well-known and well-liked cell biologists and cancer scientists. She was a very warm and social person, albeit somewhat shy. She had a good sense of humor and a rather charming way of interacting with people. She was extremely generous when it came to distributing her virus (FLV) and her cells (FELC) to those who wanted to work with them, and she would give those investigators all the guidance and assistance they needed for their work. Many remember with pleasure visiting her laboratory, going to lunch, and talking about what they were doing or would do with the wonderful tools she had provided. And if they were from out of town, she always made sure they were properly looked after. Her apartment

in the Stuyvesant Town complex on East 14th Street came to be known as "The Friend Hotel," for friends and colleagues from near and far were welcome to stay there when visiting New York—and they frequently did, some for weeks at a time.

Charlotte Friend had a genuine concern for people and took an interest in their personal lives, their families, and their problems. She was always available to listen and frequently spent evenings in the laboratory or at home doing just that. She had a dedicated staff that would have followed her to the ends of the earth. Several, such as the pathologist Jamil Haddad and the technician J. Gilbert Holland, worked with her for over thirty years.

She served as the matriarch and leader of what was a very close-knit family. She was deeply devoted to her mother, who lived with her until her death in 1961, and to her siblings and nieces and nephews. It was she to whom the immediate and extended family turned for advice and help. She particularly enjoyed advising and assisting others with their medical problems and frequently boasted of "practicing medicine without a license," perhaps reflecting regrets about not having gone to medical school.

She was a renaissance woman who loved and knew intimately the theater, dance, music, opera, and literature. No matter how tired she was or how difficult the day had been, she would jump at the chance to see a new show if someone came up with a pair of tickets at the last minute. She enjoyed traveling, seeing new sights, and meeting different people. Wherever she went, there were two things she had to do: buy stamps for her brother Morris who was a collector, and get a memento of the trip for herself, usually a unique piece of jewelry or interesting work of art. But no matter where she had been and how much she had en-

joyed the trip, it was "The City" that thrilled her most and to which she returned with joy. She loved the view of the Manhattan skyline from her apartment and could never bring herself to move to a place that might be more convenient or more luxurious.

Charlotte Friend was a woman of strong convictions and a fighter, with no compunctions about defending her ideas and the causes in which she believed. For example, she wrote letters to newspaper editors and spoke up without fear in support of blacklisted academics and dissidents, even during the McCarthy and Nixon eras when doing so could jeopardize one's grants and career. She believed whole-heartedly in the State of Israel and was an outspoken defender of its policies. She was a fervent supporter of the women's movement and frequently, without fanfare, went out of her way to ensure that women were well-represented on symposium programs and advisory and review committees. She served as a role model for many women starting their careers at a time when there were not many such models.

In the 1970s, when the demands on the relatively few senior women scientists were enormous, she worked extremely hard as president of the American Association for Cancer Research, the New York Academy of Sciences, and the Harvey Society, the first woman so honored in the long history of that society. During this same period, she also served as a member of the Advisory Committee for the Virus Cancer Program of the National Institutes of Health and a member of the Board of Scientific Counselors of the Division of Cancer Cause and Prevention of the National Cancer Institute. Over the years, she served on a number of other advisory committees and on the editorial boards of several cancer and hematology journals. She took all

these responsibilities very seriously and was noted for her incisive reviews and for her thoughtful and astute comments in committee meetings.

Charlotte Friend used to say that she started an industry, and it was true. In the two decades following the initial isolation of FLV, perhaps a third of those doing cancer research spent some time working on one or the other of the model systems she had provided. Even today, many aspects of the Friend virus complex (FLV/SFFV) remain unique among tumor viruses so that it continues to be an important, widely utilized model system (reviewed in ref. 10). For example, it acts as an acute transforming virus but does not contain an oncogene. It is immuno-suppressive and, therefore, a model for human immuno-deficiency virus (HIV). It stimulates abnormal erythroid hyperplasia by binding of virus (SFFV) glycoprotein to a growth factor (erythropoietin) receptor, a novel mechanism that may explain how other viruses can interfere with normal growth regulation.

Friend paved the way for a great many other avenues of research. She was the first to show, using her virus, that animals could be immunized with retrovirus preparations and protected against development of the disease.[18] Her experiments indicating that such protection is possible are frequently cited by those now trying to develop a vaccine against HIV. Leukemic cells induced by Friend Virus have been used in the first demonstration that a virus-induced malignancy requires for its expression the alteration or deletion of an "anticancer" or suppressor gene. Friend was one of the first to show that cells maintained in culture can actually undergo the successive steps leading to differentiation to a specific cell type. Her system was the forerunner for the establishment of other cell culture models to study

cytodifferentiation and the development of diverse lineages. Her demonstration of inducible differentiation of leukemic cells by DMSO has served as the

inspiration, as well as the prototype, for evaluating the potential therapeutic effects of differentiation-inducing agents in human cancer.

Charlotte Friend was in the tradition of many women scientists who have made contributions to botany, astronomy and microbiology. She, too, was a naturalist, an observer and, in many ways, a loner. She enjoyed the aesthetics of biology, the overview rather than the molecular. She was an inventive, instinctive scientist who had fun doing science. She did not want a large laboratory, only her devoted staff and enough funding to be able "to play," as she called it. She did, however, seek recognition and fame, and this she achieved. Her ideas and discoveries have had, and will continue to have, a major impact on our thinking about the causes, prevention and cure of cancer.

CHARLOTTE FRIEND'S complete bibliography can be found in "Viral Oncogenesis and Cell Differentiation: The Contributions of Charlotte Friend," L. Diamond and S. R. Wolman, editors, Annals of the New York Academy of Sciences, vol. 567, pp. 5–13, 1989. This memoir was submitted October 9, 1990.

Dr. Jennifer Garrus, age 45, of Thornton, Colorado, passed away on October 17, 2018 [HL003S][GDrive]

Jennifer Garrus Professional - LinkedIN profile

See [HW002M][GDrive]

Results-oriented Scientific Leader with 12 years of experience in drug discovery, translational medicine and clinical development. Proven track record managing matrix teams providing lead optimization, translational research and Phase 1/2 support for multiple programs. Known for flexibility, performing in a self-directed environment and as team member while managing junior scientists. Recognized as an effective communicator, drawing on broad knowledge base and employing team-oriented leadership to deliver results. [...]

Experience

- Merck - Senior Clinical Scientist
  - Employed Aug 2017 – Present
  - Employment Duration 2 yrs 9 mos
  - Location Greater Denver Area
- ExecuPharm - Senior Clinical Scientist on assignment to Merck
  - Employed May 2016 – Jul 2017
  - Employment Duration 1 yr 3 mos
  - Location Greater Denver Area
- Biodesix, Inc. - Senior Manager, Clinical Development/Translational Medicine
  - Employed Dec 2013 – Apr 2016
  - Employment Duration 2 yrs 5 mos
  - Location Boulder, CO
    - Collaborated with stakeholders on the design, execution and analysis of studies to elucidate the mechanism of action of VeriStrat®, a prognostic and predictive serum proteomics test for advanced non-small cell lung cancer patients
    - Wrote scientific proposals for nonclinical research projects, analyzed biomarker and clinical outcome data and prepared scientific reports for internal and external audiences.
- Array BioPharma (Total Duration 6 yrs 7 mos)
  - Research Investigator
    - Employed Oct 2012 – Aug 2013 (11 mos)
    - Location Boulder, Colorado
    - Developed Phase 2 strategies to identify nucleic acid and protein-based response biomarkers in plasma and bone marrow of patients with hematologic malignancies for two programs.
    - Managed Translational Operations group, enabling all aspects of clinical sample management for 8 concurrent clinical trials (e.g., creation of PK / biomarker sampling kits, generation of site training materials, sample tracking, and facilitating outsourcing activities).
    - Created biomarker sections of clinical protocols and clinical study reports.
    - Supervised scientific and operations staff.
  - Senior Research Scientist
    - Employed Oct 2009 – Sep 2012 (3 yrs)

- Location Boulder, Colorado
- Provided strategic, scientific and operational leadership of cross-functional teams supporting one IND-stage and 3 clinical stage programs.
- Led biomarker team for CSF-1R inhibitor program demonstrating pharmacodynamic activity in blood / serum / urine in Ph 1 patients with solid tumors.
- Coordinated predictive biomarker strategy and oversaw sample analyses (in house and outsourced) identifying protein-based plasma biomarkers related to disease, age or clinical benefit from treatment with p38 / Tie2 inhibitor in patients with MDS in Phase 1 study.
- Supervised IHC / immunoassay PD biomarker assay development and clinical sample analyses demonstrating mechanistic and functional target inhibition by p38 / Tie2 inhibitor in MDS patient bone marrow and plasma samples from Phase 1 study.
- Defined potential clinical development strategies for selective HER2 inhibitor.
- Wrote biomarker sections of clinical protocols, Investigator's brochures, informed consent forms and clinical study reports.
- Prepared presentations and technical report sections of business development documents.
- Supervised scientific staff.

- Title Research Scientist
  - Employed Feb 2007 – Sep 2009 (2 yrs 8 mos)
  - Location Boulder, Colorado
  - Provided strategic, scientific and operational leadership for 2 clinical stage programs.
  - Developed Phase 1 biomarker strategy and coordinated outsourcing of tumor biopsy IHC analyses, demonstrating target inhibition and confirming possible sensitivity marker in breast cancer patients treated with HER2 inhibitor.
  - Performed and directed nonclinical research supporting development paths of small molecule ErbB inhibitors in solid tumor indications.
  - Generated / implemented biomarker strategies for Phase 1 clinical trials,
  - Created sample collection manuals, conducted clinical site training on laboratory procedures.
  - Supervised scientific staff.

- Myriad Genetics/Myriad Pharmaceuticals
  - Total Duration 3 yrs 9 mos
  - Title Scientist II
    - Employed May 2005 – Jan 2007 (1 yr 9 mos)
    - Served as Project Leader and managed multidisciplinary lead optimization effort delivering a small molecule HIV-1 maturation inhibitor IND candidate.
    - Developed cellular assays and performed compound characterization, including resistance selection and mechanism of action studies.
    - Created IND-enabling documents.
    - Supervised scientific staff.
  - Title Scientist I
    - Employed May 2003 – Apr 2005 (2 yrs)
    - Provided scientific leadership and laboratory support for 2 antiviral lead optimization projects.
    - Developed and optimized cell-based assays and tested compounds, supporting structure-activity relationship studies of small molecule compounds for antiviral and oncology programs.
    - Managed Biosafety Level 3 (BSL3) laboratory.
    - Supervised scientific staff.

2018 (October 17) Passing -

See [HL003S][GDrive]

[...] Jennifer will be remembered for being highly intelligent, down to earth, gracious, kind, fun-loving, and for her huge, heart-warming smile – with her eyes always twinkling. She was very humble, despite being extremely accomplished in her personal and professional life. She was a devoted mother, a loving daughter and sister, a loyal friend, and a giving member of her community.

She and her family moved to Colorado when she was three years old. She lived there most of her life, aside from the 10 years she spent in Utah pursuing her PhD and working as a scientist.

As a young girl, Jennifer was precocious, and she remained curious, driven and ambitious throughout her life. She was a member of the National Honor Society at Arapahoe High School. She studied ballet, played competitive soccer, and enjoyed water sports throughout her childhood and teen years.

While earning her degree in Biochemistry from Colorado State University, she received numerous awards and certificates of recognition, as well as the distinguished Colorado Scholars Scholarship from the College of Natural Sciences.

After completing her PhD in Biochemistry, she was a Senior Clinical researcher, most recently at Merck. She was a tenacious leader and worker, managing teams who conducted critical research on cures for cancer and viruses.

She dedicated her personal time to raising her children with warmth and generosity; although she enjoyed gardening, hiking, and time with family and friends, her kids were her primary source of joy, meaning and purpose. [...] .

Condolences

See [HW002P][GDrive] (More on Wes Sundquist here)

Patrick Gavin (February 7, 2019)
I met Jenn through Brendan. I appreciated her commitment to bringing Brendan to practice and enjoyed speaking to her about life after practice while our kiddos played on the swing set. My heart goes out to Kiera and Brendan. He's still my favorite soccer player I coached! What a wonderful kid, and I hope this arrives late but with heartfelt love. [...]

Ira von Carlowitz (February 7, 2019)
Jenn, I miss you...
Suzy and I are working hard at upholding the regular get-togethers you would always plan for us...Especially after we both left Array. [...]

Sam Li (November 29, 2018)
I know Jenn since we were both graduate students in Utah, working in the same lab but on different research projects. Even though as a young graduate student, Jenn was clearly much more mature than most of us, both scientifically and socially. She was always cheerful and kind to people around her. Not only she was smart, quickly on top of her research project, she was also extremely humble and down to earth. Soon after Jenn joined the lab, we became good friends. I remember that one summer I was about to carry out a scientific project abroad. Not knowing what might lay ahead, I was anxious. While driving me to the airport, in her car Jenn said to me "You will be fine! keep doing what you think is right ... Don't forget to have some fish and chips." That is Jenn! Always encouraging and cheerful, a friend one can count on.
Throughout past twenty years, even though we were in different parts of world or country, we kept in touch. Every holiday season, I'd receive a beautiful card from Jenn. They were always handmade and in Jenn's handwriting. In the cards, Jenn talked about her new home, her kids and her work, full of love and joy. Two years ago, I had a chance to visit Boulder and met Jenn! It was so good to see her again after many years. We had great time over dinner, talking about friends and families.
I cannot believe Jenn has left us! There are only a few people who had made difference in my life. Jenn is one of them. She made me want to be a better person. Jenn will remain as my best friend. She will be deeply missed!

Wes Sundquist (November 25, 2018)
Jenn was clearly wonderful in so many of her different roles - mom, family member, friend and colleague. My own perspective on Jenn's amazing character came primarily from our interactions as scientific colleague - it was my great fortune to be her thesis advisor in the department of Biochemistry at the University of Utah from about 1997-2001. It is hard to imagine a better graduate student than Jenn. She was talented, smart, determined, insightful, and helpful to everyone. And she had golden hands in lab. Jenn simply had a gift for planning and performing experiments to produce the best possible data and insights. **Our laboratory studies the molecular virology of HIV. Viruses are obligate parasites - their genomes are too small to produce all of the activities that they need to replicate, and so they often usurp host cellular pathways to perform functions that they need.** Discovering and characterizing such processes is one of the major goals of our research. **While Jenn was a student in our lab, she led a team that discovered that HIV coopts a human cellular pathway called the ESCRT pathway to bud from cells. This was a major discovery that has since been extended to many other viruses and has had a major influence on the research directions of many leading virology labs. The paper that Jenn wrote on the topic (Garrus et al. Cell (2001) 107:55-65) remains by far the most cited paper that our lab has ever written, and it is not an exaggeration to say that her work changed the course of our research.** Like so many others, I valued Jenn above all else for her wonderful personal attributes - kindness, strength, curiosity, warmth and generosity - but I also wanted to record that she was a stellar scientist who made important discoveries that most scientists can only hope for. She will be greatly missed.

Kristen Cordova (November 4, 2018)
Jenn was an amazing person- thoughtful, kind, generous, modest, positive, loyal, and helpful... all of the qualities that you appreciate in a true friend. She was never mean and listened but never judged; she was always thankful. At her memorial, many people shared that she had helped them through tough times or helped to develop them professionally and I found that to be so very true in both regards. She was always there in the background, ready to help if asked, personally and professionally. We worked together at Biodesix and she was a bright light while I went through a rough time in my life. We used to walk together in the afternoons and talk about our day-to-day duties within the company, but we would also discuss our personal lives and the triumphs of our babies. She would crave Shamane's bakery while pregnant with Keira and I was more than happy to walk and talk with her! We took our boys to the Butterfly pavilion together and they dug through the worm exhibit and held Rosie the spider while Jenn and I chatted about life. We attended a wedding up near Estes and she said to me, "can you tell I never do anything fancy?!" as she asked me questions about what to wear and what purse to bring! I was the newest scientist hired, but she asked my opinion on scientific things. She was so humble and so gracious. I would like to thank her family for all the light she brought into my life and am sending all of my love to her sweet babies as they grow. She was beautiful inside and out and she will be missed by many people, including me.

"M) 1. 10/17/2018 Jennifer Garrus (45) was stabbed to death by her husband of fifteen years Michael Ellison (46). They had attended divorce proceedings the day before and had been reported be arguing the morning of the murder. Ellison attempted to kill himself after stabbing his wife to death by jumping out of their second story window. He survived but broke his leg. Thornton, Adams County. "

Jan 18, 2004 (Jan 18) - Scence Magazine - " TSG101: An Antiviral Target with a Murky Past / Viruses hijack a host protein that normally sorts the trash "

See [HP002I][GDrive]

Ebola (above) is a killer virus that may commandeer cellular protein-sorting pathways through TSG101.

Viruses can't do much without a host. They propagate by usurping cellular machinery, and much of an infection's misery is due to the immune response. But conventional therapies, without much luck, essentially have targeted one-half of the infection equation: the foreign invader. Now, researchers increasingly are setting their sights on the host's role.

Investigators recently attempted to mitigate the host immune response and the associated collateral damage (see sidebar). Some explore a complementary approach: to cut off access to the cellular pathway that a virus commandeers to mass-produce, specifically, the route used to bud from the cell. Doing so, without impairing the host, could provide a powerful new broad-spectrum antiviral agent. "Conventional antivirals are highly specific, and pathogens can mutate to insensitivity," says Stanley Cohen, professor of genetics and medicine at Stanford University. "But if one can attack host genes required for pathogens to be pathogenic, resistance is less likely. One can affect the pathogenicity of the virus."

DUBIOUS BEGINNINGS

Cohen, who with Herbert W. Boyer in the early 1970s essentially founded recombinant DNA technology, says he might have zeroed in on what may become the first such "host-oriented" therapeutic target: Tumor Susceptibility Gene 101. Despite its moniker, TSG101 may have less to do with cancer than first thought, and everything to do with the vacuolar protein-sorting pathway that ferries excess cell-surface receptors to lysosomes, the enzyme-filled sacs that dismantle debris. Certain killer viruses, including HIV, Ebola, and Marburg, hijack this transport system using TSG101 protein to cloak themselves in membranous escape pods. At least three biotech companies are developing drugs to target TSG101, which Cohen dubs "the getaway driver for viral release." But a clinical future awaits clarification of its obfuscated origins as a tumor suppressor.

Discovering TSG101 in 1996 was the first fruit of random homozygous knockout (RHKO) technology, an antisense technique that identifies genes by a particular function, in this case, cellular transformation.1 Dampening TSG101 expression transformed murine 3T3 fibroblasts, which caused metastatic tumors in nude mice. The encoded protein bore the hallmarks of a transcription factor, but the links to carcinogenesis turned out to be indirect.

THE VIRAL PIRATE

In 2000, experimental roads converged to flesh out the role of TSG101. Beth Agresta, a graduate student working with molecular geneticist Carol Carter, State University of New York, Stony Brook, was screening for cellular proteins that interact with HIV proteins. "She got several hits and wrote her thesis on one, but continued to check the database to see if there was any more information. One day, there was," recalls Carter. That was TSG101. Carter and Cohen collaborated to get at protein function.

Soon, another graduate student in Carter's group, Lynn Ver-Plank, identified the major viral core protein Gag as HIV's binding site for TSG101.2 Gag lets mature viruses bud from cells. **At about the same time, Jennifer Garrus, a graduate student with biochemist Wesley Sundquist, University of Utah School of Medicine, Salt Lake City, blocked TSG101 with small interfering RNA, halting HIV budding. When she restored gene function, budding resumed.3**

Gag and TSG101 attach by ubiquitin tags, and the host protein then escorts the viral emissary into the vacuolar protein-sorting pathway. But instead of being carted away to digestive doom in the lysosome, Gag proteins attach by their bound TSG101s to bits of cell membrane, ultimately becoming packaged into mature virions.

Yeast provided another connection. Also in 2000, University of Utah biologist Markus Babst and Scott Emr, a Howard Hughes Medical Institute investigator at the University of California, San Diego, found that TSG101 has a yeast counterpart, Vps23.4 Vps23/TSG101 is a subunit of a complex, called ESCRT-I, which binds and sorts ubiquitin-tagged molecules. They tested Cohen's TSG101 mutant cell line for protein transport defects and found trafficking phenotypes, says Babst.

The solid link to intracellular protein transport may explain the dual role of TSG101 in carcinogenesis and viral infection. The pathway normally recycles cell-surface receptors, including growth-factor receptors. Silence TSG101, and these receptors aren't sent to the lysosomal garbage dumps; instead they accumulate at the cell surface like uncollected trash. There, the receptors transduce too many signals to divide, and runaway mitosis results.

But the cancer connection still is not as clear as some researchers would like. "The role of TSG101 in cancer has been quite elusive," says Sundquist, citing a retracted report on TSG101 mutations in cancer patients.5 And Kay-Uwe Wagner, at the Eppley Institute for Research in Cancer and Allied Diseases at the University of Nebraska Medical Center, Omaha, used knockout mice to show that TSG101 is essential for embryo implantation but not tumor suppression.6 She also reexamined the original 1996 tumorigenic cell line and found "whopping levels" of TSG101.7 She blames Cohen's use of an immortal cell line. "Nobody was able to repeat these transformation studies in other cell lines," she says.

DRUG DEVELOPMENT

Still, Cohen maintains that TSG101 makes a good antiviral target. He and former postdoctoral researcher Limin Li cofounded the company Functional Genetics, which is developing a viral budding inhibitor based on TSG101's action.

But the jump from promising target in cell culture to antiviral development will not be easy. Such a drug probably would block normal ESCRT function as well, says Babst. "This could result in a tumorigenic phenotype." Effects could be wide-ranging. "I'm worried about the potential that a TSG101 inhibitor would exhibit general cytotoxicity," suggests Sundquist, who also works with Myriad Pharmaceuticals in Salt Lake City.

Even if TSG101 never overcomes its tainted beginnings, it may still pioneer host-oriented therapeutics, for there may be unknown aspects of the viral subversion of TSG101 to exploit. Concludes Carter: "That's what one goes after – to understand the process, what the virus does to divert the machinery – and target that."

Fight the Flu, Ignore the Bug

At the start of this year's particularly worrisome flu sea-son, researchers at London Imperial college in the United Kingdom posed a comforting thought. Suppose the bug's nasty symptoms could be avoided without vaccination or antiviral drugs by targeting the immune responses responsible for influenza's misery. Their tests on mice showed positive results, they say. Maybe so, say the skeptics, but that doesn't prove how humans would respond.

The Imperial College researchers have found that a receptor molecule called OX40 is overexpressed in T cells responding to a viral infection, but not in the remaining T-cell population.1 The receptor can be blocked using an OX40-immunoglobulin fusion protein called OX40:Ig. This, the researchers say, should temper overzealous immune responses in the lungs.

Tracy Hussell and colleagues, who tested the drug on mice injected with influenza type A, found that clinical symptoms such as congestion and high body temperature were virtually eliminated. Hussell says there's no reason why the treatment could not be extended to humans, after symptoms have emerged. "Mice could show signs of illness for three days, and as soon as you administer this reagent, it stops clinical symptoms in their tracks."

In the future, humans could experience similar remission of symptoms, according to Alan Hay, director of the WHO Collaborating Centre for Reference and Research on Influenza at the UK National Institute for Medical Research. "It's interesting work, but it's early stages and needs further development," says Hay.

Brad Magor, assistant professor, Department of Biological Sciences (Immunogenetics), University of Alberta, is more dubious. "Mice are not natural hosts to influenza A, so their response to the pathogen is less likely to reflect that of a natural host such as a chicken, swine, or human." Magor says he's concerned that the body might permanently lose influenza-specific memory cells as a result of the treatment. He conceded, however, that blocking OX40 molecules showed significant promise for modulating immunity and inducing tolerance to engrafted organs.

Hussell says the group is focusing on the influenza treatment for now and is applying to the UK Medical Research Council and the Wellcome Trust for funding to begin human clinical trials. The Imperial College group collaborates with Xenova, a UK-based biotech that explores various therapeutic uses of OX40, including autoimmune disease and cancer.

HIV-1 reprograms the cellular machinery and employs several unknown host proteins to bud from infected cells. In 5 October Cell, Jennifer Garrus and colleagues from University of Utah School of Medicine and Myriad Genetics, Salt Lake City show that the human tumor susceptibility gene 101 (Tsg101), which functions in vacuolar protein sorting (Vps) pathway, is critical to HIV-1 budding and the progression of the disease into full-blown AIDS.

Garrus et al. used small interfering RNA to stop production of Tsg101 in HIV infected human embryonic kidney cells lines. They found that Tsg101 depletion stopped HIV-1 replication at a late stage of the budding process. When they re-introduced Tsg101 in these cells, HIV-1 budding resumed. In addition, they showed that dominant negative mutant Vps4 proteins that inhibit vacuolar protein sorting also arrest HIV-1 budding (Cell 2001, **107**:55-65).

New AIDS drugs that inactivate the Tsg101 protein may limit the amount of HIV virus in people who are infected. "This would be a whole new class of anti-HIV drugs," said Kenton Zavitz, a biochemist at Myriad who participated in the study.

Abstract

Introduction:A randomized phase 2 study was designed to compare the combination of ficlatuzumab (AV-299), a humanized hepatocyte growth factor–neutralizing monoclonal antibody, plus gefitinib versus gefitinib monotherapy in a pulmonary adenocarcinoma population clinically enriched for EFGR tyrosine kinase inhibitor–sensitizing mutations.**Methods:**A total of 188 patients were randomized 1:1 to receive either gefitinib or ficlatuzumab plus gefitinib treatment. Patients who demonstrated disease control in the single-agent gefitinib arm were allowed to cross over to ficlatuzumab plus gefitinib treatment upon disease progression. Molecular analyses included tumor *EGFR* mutation status and retrospective proteomic testing using VeriStrat, a multivariate test based on mass spectrometry.**Results:**The addition of ficlatuzumab to gefitinib did not provide significant improvement over gefitinib monotherapy for the primary end point of overall response rate or the secondary end points of progression-free survival and overall survival. In the subgroup classified as VeriStrat poor, the addition of ficlatuzumab to gefitinib showed significant improvement in both progression-free survival and overall survival in both the intent-to-treat population and the subgroup with EGFR tyrosine kinase inhibitor–sensitizing mutations. For all patients, the most frequent adverse events were diarrhea, dermatitis acneiform, and paronychia.**Conclusions:**Although the trial showed no significant benefit from the addition of ficlatuzumab to gefitinib in the overall population of Asian patients with advanced-stage pulmonary adenocarcinoma, the biomarker data suggest that patients classified as VeriStrat poor may benefit from ficlatuzumab combination therapy.

Abstract

The HIV-1 Gag protein recruits the cellular factor Tsg101 to facilitate the final stages of virus budding. A conserved P(S/T)AP tetrapeptide motif within Gag (the "late domain") binds directly to the NH2-terminal ubiquitin E2 variant (UEV) domain of Tsg101. In the cell, Tsg101 is required for biogenesis of vesicles that bud into the lumen of late endosomal compartments called multivesicular bodies (MVBs). However, the mechanism by which Tsg101 is recruited from the cytoplasm onto the endosomal membrane has not been known. Now, we report that Tsg101 binds the COOH-terminal region of the endosomal protein hepatocyte growth factor-regulated tyrosine kinase substrate (Hrs; residues 222-777). This interaction is mediated, in part, by binding of the Tsg101 UEV domain to the Hrs 348PSAP351 motif. Importantly, Hrs222-777 can recruit Tsg101 and rescue the budding of virus-like Gag particles that are missing native late domains. These observations indicate that Hrs normally functions to recruit Tsg101 to the endosomal membrane. HIV-1 Gag apparently mimics this Hrs activity, and thereby usurps Tsg101 and other components of the MVB vesicle fission machinery to facilitate viral budding.

Introduction

The HIV Gag protein orchestrates viral assembly and budding, and forms the structural shell of the immature virus (for review see Göttlinger, 2001). Even in the absence of any other viral proteins, HIV-1 Gag can form extracellular virus-like particles (VLPs) that resemble authentic HIV virions. Efficient release of

the absence of any other viral proteins, HIV-1 Gag can form extracellular virus-like particles (VLPs) that resemble authentic HIV virions. Efficient release of HIV-1 virions and Gag VLPs from most cell types requires the presence of a "late domain" located in the COOH-terminal Gag p6 region (Göttlinger et al., 1991; Huang et al., 1995; Demirov et al., 2002b). All HIV-1 strains contain the late domain tetrapeptide motif P(S/T)AP (where the second position can be either Ser or Thr; **Fig. 1**), which is a docking site for the cellular protein, tumor susceptibility gene 101 (Tsg101; for review see Pornillos et al., 2002c). Tsg101 appears to facilitate viral budding by recruiting additional cellular factors that can catalyze release of the enveloped virion. In addition to the P(S/T)AP sequence found in HIV-1 Gag, distinct late domain sequences have also been identified and characterized in several other enveloped RNA viruses. The best characterized of these is the PPXY motif (where X is any amino acid), which binds the Nedd4 protein family of ubiquitin E3 ligases (Xiang et al., 1996; Harty et al., 1999, 2001; Strack et al., 2000; Kikonyogo et al., 2001; Yasuda et al., 2002; Timmins et al., 2003).

Abstract

Efficient human immunodeficiency virus type 1 (HIV-1) budding requires an interaction between the PTAP late domain in the viral p6(Gag) protein and the cellular protein TSG101. In yeast, Vps23p/TSG101 binds both Vps28p and Vps37p to form the soluble ESCRT-I complex, which functions in sorting ubiquitylated protein cargoes into multivesicular bodies. Human cells also contain ESCRT-I, but the VPS37 component(s) have not been identified. Bioinformatics and yeast two-hybrid screening methods were therefore used to identify four novel human proteins (VPS37A-D) that share weak but significant sequence similarity with yeast Vps37p and to demonstrate that VPS37A and VPS37B bind TSG101. Detailed studies produced four lines of evidence that human VPS37B is a Vps37p ortholog. 1) TSG101 bound to several different sites on VPS37B, including a putative coiled-coil region and a PTAP motif. 2) TSG101 and VPS28 co-immunoprecipitated with VPS37B-FLAG, and the three proteins comigrated together in soluble complexes of the correct size for human ESCRT-I (approximately 350 kDa). 3) Like TGS101, VPS37B became trapped on aberrant endosomal compartments in the presence of VPS4A proteins lacking ATPase activity. 4) Finally, VPS37B could recruit TSG101/ESCRT-I activity and thereby rescue the budding of both mutant Gag particles and HIV-1 viruses lacking native late domains. Further studies of ESCRT-I revealed that TSG101 mutations that inhibited PTAP or VPS28 binding blocked HIV-1 budding. Taken together, these experiments define new components of the human ESCRT-I complex and characterize several TSG101 protein/protein interactions required for HIV-1 budding and infectivity.

Michael Arthur Ellison

2018 (Oct 17) - Legal notice from District Attorney - "Thornton Man Charged with First-degree Murder in Stabbing Death of his Wife "

See [HG004E][GDrive]

17th Judicial District Attorney Dave Young announced Wednesday that Michael Arthur Ellison has been charged with first-degree murder after deliberation in the stabbing death of his wife in Thornton.

Thornton police found Jennifer Ellison, 45, dead at the couple's home at 13154 Uinta Street in Thornton on October 17 after receiving a 911 call from Michael Ellison.

Ellison (DOB 02/25/72) was advised of the charges Wednesday in Adams County District Court. A preliminary hearing is set for December 31 in Division E of Adams County District Court.

The filing of a criminal charge is merely a formal accusation that an individual committed a crime under Colorado Laws. A defendant is presumed innocent until and unless proven guilty.

Birthdate: January 22, 1858 (not 1860)

Death: April 30, 1926 (66) / Seattle, King County, Washington, United States

Main source - https://www.findagrave.com/memorial/86517134/william-henry-gates - See below ..

William H. Gates (1858-1926) came from Pennsylvania in 1888, and went on the Dawson Gold Rush of 1898. In 1900, he had a furniture store in Nome, Alaska. He and Rebecca (1867-1933) lived in Seattle in the early 1900's where his daughters, Pearl and Florence, partook in the rarified atmosphere of young Seattle socialites. Their son, William Gates, Jr. was born in 1891, daughter Pearl Gates in 1895, and Florence Gates who married Harry Schumacher on October 22, 1913. He became a city councilmember in Bremerton. (Provided by Vicki Stiles, Director, Shoreline Historical Museum)

Date Of Death: 30 Apr 1926

Age: 68

Father Name: Joseph C. Gates

Mother Name: Martha A. Satterley

Death Place: Seattle, King, Washington

Spouse Name: Rebecca Gates

1860 Census - Note that there is another Gates family in Tioga county,

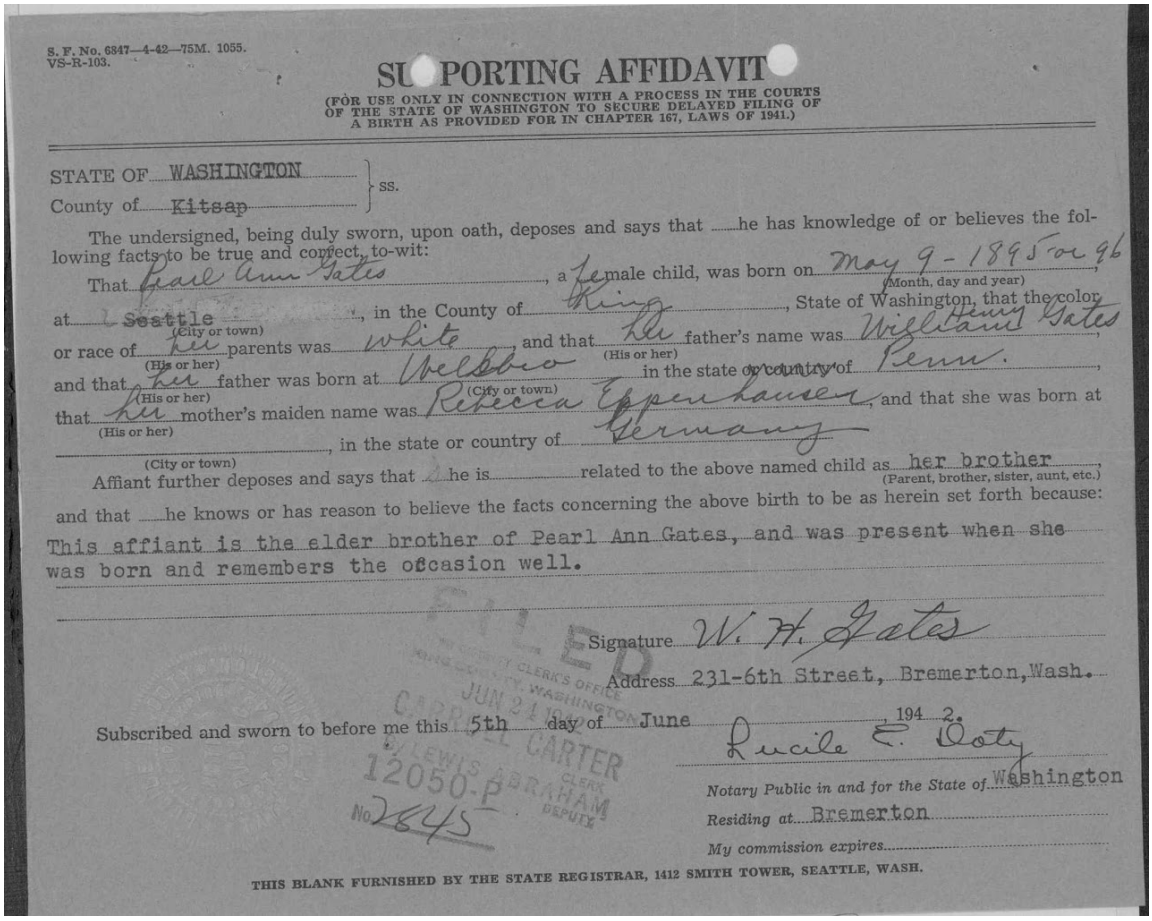
1895 (May 09) - Pearl Ann gates birth info - But the birth record isnt created until June of 1942 ???

- Why was this filled out on June 5th ... 1942 ???
- How could the brother remember .. he was three years old ! "remembers the occasion well"
- Again, no mention of where in Germany She was born .. .her name is now back to being "Eppenhauser"
- The certificate has "seattle" as the birth location, but it was clearly typed OVER something else
- "May 95 or 96.... but remembers the occasion well ? "



S. F. No. 6847—4-42—75M. 1055.
VS-R-103.

SUPPORTING AFFIDAVIT

(FOR USE ONLY IN CONNECTION WITH A PROCESS IN THE COURTS OF THE STATE OF WASHINGTON TO SECURE DELAYED FILING OF A BIRTH AS PROVIDED FOR IN CHAPTER 167, LAWS OF 1941.)

STATE OF WASHINGTON
County of Kitsap } ss.

The undersigned, being duly sworn, upon oath, deposes and says that he has knowledge of or believes the following facts to be true and correct, to-wit:

That Pearl Ann Gates, a female child, was born on May 9 - 1895 or 96 (Month, day and year)
at Seattle (City or town), in the County of King, State of Washington, that the color or race of her (His or her) parents was White, and that he father's name was William Henry Gates, and that her (His or her) father was born at Wellsboro (City or town), in the state or country of Penn., that her (His or her) mother's maiden name was Rebecca Eppenhausen, and that she was born at _____ (City or town), in the state or country of Germany

Affiant further deposes and says that he is related to the above named child as her brother (Parent, brother, sister, aunt, etc.), and that he knows or has reason to believe the facts concerning the above birth to be as herein set forth because:

This affiant is the elder brother of Pearl Ann Gates, and was present when she was born and remembers the occasion well.

Signature W. H. Gates

Address 231-6th Street, Bremerton, Wash.

Subscribed and sworn to before me this 5th day of June, 194 2.

Lucile E. Doty

Notary Public in and for the State of Washington

1900 - USA Census

Full PDF of transcript - [HS002W][GDrive] / Full census sheet - [HS002T][GDrive]

1. .**Occupation** is hard to read, might say "grocer" ?
2. **Rebecca Gates - Date of Birth** is "October 1869"; Immigration date is "1882, in the USA for 18 years"
    1. NOTE : This is the only time we see a clearly noted birthdate. However, other census forms have her using October 1868 (or rounding up to Jan 1968) as a birthdate.
3. One **servant** living with the Gates family at this time (I think it may be a person renting a room)
4. **Address** - The Gates family is living in Seattle, but the address is impossible to read on the Census form. It looks a little bit like "Ross West --- " / "South of Canal" is written there, but not sure.

1911
[HD001X][GDrive]

1912 - William H. Gates (b1858) moves to Bremerton (from Seattle) - Wife Rebecca stays at 1625 3rd Ave property for 2 more years.

Source : [HN00YM][GDrive]

NOTES:

1. In 1911, WIllian H is listed in the 1911 phone book ([HD001X][GDrive]) in Seattle - Florence, Pearl, and Jr are all listed at this address still
    1. 2029 1st Ave. , Seattle ... home is 1625 3rd West
2. In 1912, William H is no longer listed in the Seattle phone book ([HD001Z][GDrive]) , but his wife still is along with a couple of the children
3. In 1913, wife Rebecca is STILL listed in Seattle phone book ([HD0021][GDrive]), but WHG0 isnt. So she is either living there fulltime, or this is jsut a rental property.
4. By 1914, they are no longer in the property ([HD0023][GDrive])
5. Note - 1914 re-grading of 6th avenue, maybe related? https://www.pinterest.com.au/pin/8233211794914170/?amp_client_id=CLIENT_ID(_)&mweb_unauth_id={{default.session}}&from_amp_pin_page=true

1912 / 1913 - Rebecca Gates (wife) and children remain at 1625 3rd Ave

1913
[HD0021][GDrive]

1913 - 1918 : "Wm H. Gates Furniture" and "Wm. H Gates Second Hand Goods" in Business in Bremerton (on Second St.)

See **Puget Sound Genealogical Society Newsletter , Volume 30 Number 2 June 2005** : [HP002X][GDrive]

- **Gates, Wm. H. (2nd hand goods) 214 Second [St.] 1917-18**
- **Gates, W. H. (furniture) 214 Second [St.] 1913-14**

Was this a new, premier building built by the Bremer family ? Answer - No, but next door, and on the same block

See Bremerton, Washington (source of the following is [HW0033][GDrive]) :

*"**William Bremer** died young, at age 47. On the day of his burial, December 30, 1910, Bremerton's businesses closed for two hours in the afternoon and the town's flags were flown at half-mast. His widow, **Sophia Hensel Bremer (1872-1959)**, took over management of the family properties and with the three Bremer children she would continue to play an influential role in Bremerton for many years. One of the family's signature projects was the construction in 1914 of the **Bremerton Trust and Savings Bank building on the northeast corner of 2nd Street and Pacific Avenue**, one of three buildings in Bremerton designed by noted Seattle architect Harlan Thomas (1870-1953)."*

Technically, the address of this building is 202 Pacific Ave. See (https://www.loopnet.com/Listing/202-Pacific-Ave-Bremerton-WA/17531175/)

214 Second St, Bremerton, is today a parking garage - so different building, but on the same block

1913 - Son Willian H Gates gets married

https://www.familysearch.org/ark:/61903/3:1:3Q9M-CS75-3S7L-G?i=305&cc=1534448

1915 - No more William H Gates in Seattle (per Seattle directory)

https://www.ancestry.com/imageviewer/collections/2469/images/15518373?treeid=&personid=&hintid=&usePUB=true&usePUBJs=true&_ga=2.100929543.783907915.1596576946-1615111073.1596074686&pId=751560425

1917 (June) - Son enlists in draft for WW1

Son William Henry Gates (born 1891) is age 26 at this time; See [HG005T][GDrive]

- Employer - Ames Shipyard and Dry Dock - "Machinist in Ship Yard" ; job is as a "machinist in ship yard"
- Home Address - 5944 48th South Street / Claimed Draft exemption because "employed in ship yard"

1917/1918 (estimated - no specific dates available) - [William H. Gates} is now with "U.S. Furniture" - Perhaps the "Wm H. Gates" business is now called "U.S. Furniture / US Furniture" (same address at 214 Second St.)

See **Puget Sound Genealogical Society Newsletter , Volume 27 Number 3 Sep 2002** ; [HP002W][GDrive] ... but no specific dates ...

Earliest reference to any US Furniture I can find is 1915 ..... but this is in Aberdeen, Washington (on the pacific coast)

Below : See **Puget Sound Genealogical Society Newsletter , Volume 31 Number 1 March 2006** ; [HP002Y][GDrive] ... but no specific dates ...

CERTIFICATE OF DEATH

Record No. 1231
Registered No. 1287

Registration Dist. No. ..... No. 7070 East Marginal Way
(If death occurred in a hospital or institution, give its NAME instead of street and number)

2. FULL NAME WILLIAM HENRY GATES SR. 330

(a) Residence No. 7070 East Marginal Way
(Usual place of abode)

(b) If non-resident, give city or town, and state .....

(c) How long in Registration Dist. 38 yrs. ..... mos. ..... ds.; how long in U. S. if of foreign birth ..... yrs. ..... mos. ..... ds.

Personal and Statistical Particulars

3. Sex	4. Color or Race	5. Single, Married, Widowed or Divorced (Write the word)
Male	White	Married

5. (a) If married, widowed or divorced:
Husband of Rebecca Gates
or
Wife of .....

6. Date of birth: Jan. (Month) | 22 (Day) | 1858 (Year)

7. Age: 68 yrs. | 3 mos. | 8 ds. | hrs. | or min. (If less than one day)

8. Occupation of deceased:
(a) Trade, profession, or particular kind of work: General Business
(b) General nature of industry, business, or establishment in which employed (or employer) .....
(c) Name of employer .....

9. Birthplace (City or town) (State or country): Pennsylvania

PARENTS
10. Name of Father: Joseph C. Gates
11. Birthplace of Father (City or town) (State or Country): Conn.
12. Maiden name of Mother: Martha A. Satterlee
13. Birthplace of Mother (City or town) (State or Country): Pennsylvania

14. Informant: William H. Gates, Jr.
Address: Bremerton, Wash.

15. Filed MAY 1 1926 192 F. T. HANLEY M. D. Registrar.

I HEREBY CERTIFY, upon honor, That I have made the effort but was unable to secure answers to questions ..... (Insert numbers of unanswered questions)

JUN 4 1926 (Signature of Undertaker)

Medical Certificate of Death

16. Date of death: April (Month) | 30 (Day) | 1926 (Year)

17. I HEREBY CERTIFY, That I attended deceased from ..... 192 ..., to ..... 192 ...
that I last saw h ..... alive on ..... 192 ...
and that death occurred on the date stated above, at 11:30A m.
(State the disease causing death, or in deaths from violent causes, state: (1) Means and nature of injury; and (2) whether ACCIDENTAL, SUICIDAL or HOMICIDAL).
The CAUSE OF DEATH was as follows:
(Primary) Carcinoma of Stomach 44
(Duration) ..... yrs. ..... mos. ..... ds.
CONTRIBUTORY
(Secondary) .....
(Duration) ..... yrs. ..... mos. ..... ds.

18. Where was disease contracted if not at the place of death? .....
(a) Did an operation precede death? ..... Date of .....
(b) Was there an autopsy? .....
(c) What test confirmed diagnosis? .....
(Signed) W. H. Corson, Coroner M. D.
May 6 192 Address Seattle, Wash.

19. Place of Burial, Cremation or Removal: Cremation | Date of Burial: May 2 192 6

20. Undertaker: Arthur A. Wright & Son | Address .....

Medical certificate of death must be filed with the local registrar within 24 hours after death occurs. Burial permit must be obtained before interment, removal or cremation of body. Enter statement of OCCUPATION is very important.

There is a village of "eppinhausen" in Germany -

German Wiku only : https://de.wikipedia.org/wiki/Eppenhausen

The beginnings of Eppenhausen lie in the dark of history, the name of the district suggests that there was a farm here that belonged to an Eppo or Eppinc and was named after him. [2]

Eppenhausen was mentioned for the first time in 1229 as Eppenhusen in the goods and income register of the women's convention and later noble ladies' convent in Herdecke. [3] From 1271 to 1374 a knight Goswin von Eppenhausen is documented in old sources, he had his own seal. Around 1400, the Count von der Mark had rights in the Eppenhuser Marke. [4] After the division of the Westphalian brands in 1450, there was an "Eppenhauser Mark", which included today's districts of Halden, Herbeck, Eppenhausen, Emst and Delstern.

The farming community Eppenhausen belonged to the county of Mark in the parish and court of Hagen. In the treasure book of the county of Mark from 1486 in the Eppenhuser Burschop 12 taxable farm owners (2 from Emst) with a levy between 1 oirt (¼ Gg) and 8 gold guilders were mentioned. [5]

In 1746, the neighboring town of Hagen in Eppenhausen was granted city rights; in 1751, Frederick the Great dissolved the stamps, meaning that this also meant the end of the Eppenhauser Mark.

In the 1780s, the then district baron von Hövel auf Herbeck submitted an application to the royal court in Berlin to have the "Eppenhauser Brunnen" recognized as medicinal water due to the medicinal water that was found there. Even after the rejection, the fountain - above all by the Hohenlimburg widow Bettermann - was advertised as a fountain of health and baths were administered until the 1870s.

In 1814 Eppenhausen received its own post line and a post station, in 1898 Eppenhausen was declared an independent parish, and on August 5, 1900 the first tram line for the new electric tram ran from Hohenlimburg to Eppenhausen, the operation of which was only discontinued in 1975.

On April 1, 1901, the municipality of Eppenhausen was incorporated into the city of Hagen together with the municipalities of Delstern and Eckesey [6], the population of which rose to 68,402 inhabitants.

*Pearl Ann Gates and her sister were socialites in Seattle during the early 1900–teens, and were seen in all the right places. While Florence (her sister) married **Harry Schumacher** in 1914, Pearl was a somewhat freer spirit and married three times, with no big pictures or social page announcements - first Carlyle, then Hogenson in 1931 in Island County, from whom she was divorced in 1952, and much later Hager. Throughout her young life, she enjoyed many sewing circles, which were announced in the polite social pages, and she went on to become a nurse in 1925, and took sewing classes at Edison Technical College.*

Eventually she owned a retreat of small cabins on Lake Washington in Lake Forest Park, where people could rest and recover from any of the ills of society. She is here interred with her parents. (Provided by Vicki Stiles, Director, Shoreline Historical Museum)

Florence died 1928?

William Charles Gates (born 1860)

Wikipedia - https://en.wikipedia.org/wiki/Bill_Gates_(frontiersman)

NOTE - We researching rumors that this William Charles Gates (born 1860), who sometimes went by the name of "William Henry Gates", may have been the same person as William Henry Gates (born 1858) . Note these claims are not proven, and made on circumstantial evidence. However, there is much about William Charle Gates (born 1860) that is undocumented. We hope to determine the truth, based on open-sourced evidence.

"Swiftwater" Bill Gates (born 1860 died 1935) was an American frontiersman and fortune hunter, and a fixture in stories of the Klondike Gold Rush. He made and lost several fortunes, and died in Peru in 1935 pursuing a silver strike.

In one famous Klondike story he presented Dawson dance hall girl Gussie Lamore her weight in gold.[*citation needed*]

Gates was married briefly to Grace Lamore in 1898; he later married Bera Beebe, with whom he fathered two sons, Fredrick and Clifford. Gates subsequently abandoned her for 15-year-old Kitty Brandon, his niece.

His biography "The True Life Story of Swiftwater Bill Gates" (c. 1908) was authored by Iola Beebe, his mother-in-law.

Swiftwater Bill was known to be at the gold fields of Nome, Alaska at the same time as William H Gates I, grandfather of the Microsoft founder. However, despite the similarity in name and coincidences of gold, there is no apparent family relationship between "Swiftwater Bill" and Microsoft founder Bill Gates.

In fiction, he has been portrayed by Gordon Pinsent in the 1985 film *Klondike Fever* and Colin Cunningham in the 2014 miniseries *Klondike*.

LIFE IN THE KLONDIKE.

Gambling, Dancing and Drinking the Main Pastimes in Dawson.

BEER IS 50 CENTS A GLASS.

Gold Is Taken Out by the Ton and Men Spend $1,000 Daily for Fun.

SALOONS ARE MAKING FORTUNES.

Yellow Nuggets Not Guarded with Nearly the Care That a Side of Bacon Is.

(Copyright, 1897.)
(Special Correspondence of The World.)

DAWSON CITY, N. W. T., Sept. 10.—The one place in all the world where money has no value is on the Klondike. Men think no more of spending from $300 to $1,000 a day than of eating three square meals. The poorest kind of whiskey and beer finds ready sale over the bars at 50 cents a drink. Night and day scores of gambling games are running in full blast. Behind every bar are cans, tin cups and beer glasses containing pounds of the yellow metal fresh from the mines. Men come in from the diggings and take their places at the gambling tables with the ease and nonchalance of millionaire gamblers. Tonight "Swift-Water Bill," a young man from Spokane, Wash., who owns some of the richest claims on Eldorado Creek, came to town and took a seat at the faro table. In an hour he had lost $7,500 in gold nuggets.

Arising from the table, he lighted a cigar and "invited the house" to drink at his expense. The treat cost him $112. Hardly an evening passes but that similar scenes are enacted, and yet the old-timers aver that the town is dull and that real good times will not come around before "the spring clean-ups."

Gold by the Ton.

One year ago the 22d of this month the first gold was taken out of the tributaries of the Klondike. I have made careful inquiries among the trading companies, the wealthy and more intelligent class of miners, the Government officials and the ordinary run of miners themselves, and, averaging their estimates, it is safe to say that between four and five tons of gold have been taken out of the mines on Eldorado and Bonanza Creeks. That amount of gold represents $2,741,760 in coin. And yet not one-fifth of these rich diggings have been properly worked and many of the claims hardly prospected.

The hard-pan in Eldorado Creek is rough and ridged and partly riffled, and on this character of foundation the gold has accumulated in large quantities. In many places the yellow metal is almost free of foreign substance. It is hard to realize how plentiful the gold really is to $124,500, and the day the successful miners were taking their departure on the first steamer of the season the receipts amounted to $6,500. Hardly a saloon in town is receiving less than $300 a day, besides winning large sums of money at the gambling games. Barkeepers are paid from $12.50 to $20 a day, and even the porters, where such luxuries are deemed necessary, are paid from $7.50 to $10.

A rumor has emanated from official sources and is going the round to the effect that a Canadian official will arrive shortly and enforce the law permitting only hotels and innkeepers to engage in selling liquors.

Lots Jump from $1.25 an Acre to $14,000 Apiece.

The site of Dawson City was originally located by Joe Ladue and Harper as a town site. The latter is a trader and owns several stores in the Northwest. They were the first to get a "tip" of the great strike and lost no time in securing 160 acres of land as a town site for $1.25 an acre. Lots 50x100 feet are now selling for amounts varying from $8,000 to $14,000, and an ordinary building lot on the edge of the town at the base of the mountain is sold for $250 and upward.

Last year logs sold for $1.40 apiece and now they command $3 and $4. Most of the buildings are constructed of logs hewn on three sides and solidly chinked with heavy moss. The roofs are made of poles, on which a layer of moss fully ten inches thick is laid, and then a layer of dirt about twelve inches deep serves to keep out the cold.

If green logs or logs that are not properly dried are used, they crack and make reports not unlike a pistol shot when the heavy frosts come, and for the remainder of the winter frost will accumulate on the inside of the cabin and it is impossible to get enough heat out of the stoves to thaw the ice.

Heavy embankments of earth piled up against the huts on the outside serve as additional protection against the chilling blasts of the arctic winter gales. A few saloons are built of lumber with double walls, between which sawdust and moss are tightly packed, but old Yukoners tell me that such constructed buildings are inadequate against the severe cold weather.

Dawson City Improvements.

About eighty log cabins and some five hundred or six hundred tents constitute the improvements of Dawson City. The buildings are on the streets and a wide avenue separates the city from the river bank. The two commercial companies have built fine, large two-story stores and warehouses. The improvements made by the Alaska Commercial Company must have cost nearly $100,000, and those of the North American Trading and Transportation Company were not much less expensive.

To build the commonest kind of a log cabin, 18x24 feet, costs from $3,000 to $6,000, and the buildings erected by the former company cover an entire block and are of the most substantial character that money and labor can build.

Front street is the principal thoroughfare and is the locality where nearly all of the business is transacted and is on the east side facing the river. The street is full of hewn timbers and chips, and carpenters are working from early dawn till late at night erecting cabins to accommodate the demands of the trade.

Mechanics are paid an ounce for nine hours' work and many of them are earning from $20 to $25 a day. In another month the river will probaby freeze, navigation will cease and cold weather will be in order until the middle of next May. Consequently all buildings must be finished by the middle of October, and on account of the great demand for cabins carpenters are practically naming their own wages.

The streets are full of tents, but the Canadian officials are compelling builders to erect cabins on the lines of their property, and in a short time Dawson City will bear the resemblance of a well laid out frontier town. Aside from the two stores, three or four barber shops, half dozen laundries, five or six restaurants, a second-hand store or two, two sawmills, three butcher shops, two jewelry stores, a dozen physicians and dentists and a couple of real estate offices, the principal business engaged in is the sale of intoxicants.

Prevailing Prices.

Compared with prices in the States the charges at first glance seem exorbitant, but when the prevailing rate

on some of the claims. Miners do not now bestow a passing comment of surprise on claims yielding less than $2,000 or $3,000 a day.

Bonanza is another rich creek, but the full extent of its wealth cannot be definitely determined for several months or until the "dumps"—the dirt that is taken out during the winter and sluiced in the spring—are worked. Other creeks are showing up well and the approaching winter promises to make Dawson City the liveliest mining camp the world ever knew.

Gambling and Dancing.

The great attractions, or rather objects of interest, are the gambling games and the dance halls. Gamblers winning or losing from $500 to $3,000 at a single sitting are not worthy of passing comment. In fact games involving $5,000 or $10,000 are running night and day. Professional dealers of "banking games" receive $20 a day.

The manner of hazarding money is unique even in a mining camp. The player takes his seat at a faro table and passes over his sack of gold dust to the dealer, who drops it into a small pigeonhole. The chance of "overplaying his sack" devolves upon the player's honor. He is given full credit and can call for as many chips from the check rack as he wishes. As the checks are passed out a tab is dropped on his sack.

At the conclusion of the play the chips on hand are credited to the account of the sack. The dealer hands the player a slip of paper showing the condition of the account and the latter takes it and his sack of gold to the bar. If he has lost he weighs out his gold dust, or in the event of winning the barkeeper does the paying.

At first glance it would seem that such a system would afford considerable temptation for dishonest men to walk out with their sacks of gold without settling their accounts.

Only one or two instances of the kind have occurred and the condemnation of the community has inflicted such punishment as to warrant the non-repetition of the events.

How Dance Halls Are Run.

The dance halls open about 7 or 8 o'clock in the evening and the band plays on till late in the morning. A dozen or more women, many with young and rather pretty faces, are in attendance. They have little or no time to rest between the dances, and when the morning dawn comes peeping over the mountain summits they are a tired-looking crowd. The amusement continues night after night.

The halls are crowded with gallant beaux, the most of them, having heavy, spiked-bottom shoes, broad-brimmed hats, costumed in the regulation mining suits and with cigars between their teeth, present an odd appearance indeed.

The dance halls are constructed of hewn logs, roofs covered with moss and earth and low ceilings. Each dance costs $1, and one man in three nights spent seven ounces of gold, or $119, for the luxury. In some of the halls a free fight is almost certain to conclude the festivities along toward morning.

Occasionally men will come to blows in attempting to win the hand of some woman for the succeeding dance. "Fair play" is the watchword, and the best skilled pugilistic gladiator goes to the head of the set and his rival goes home.

Saloons That Make Fortunes.

Saloons are running "wide open" and do not pay a license. As a rule they sell a fair class of beverages. Drinks and cigars retail at 50 cents, and the two breweries that are located here cannot supply the demand for steam beer at $125 a keg. A poor quality of champagne is retailed at $30 a pint and a better quality at $10 higher.

In liquidating indebtedness at the bar the individual doing the honors passes his sack over to the barkeeper, who pours out enough of gold dust to settle the account. It is hardly necessary to add, I suppose, that the barkeepers are never charged with neglecting to take enough dust, and particularly when the patrons are somewhat under the influence of copious libations. Two or three saloon men admitted to me privately that the "rake-off," as they term overweighing, amounts to about 30 or 40 cents on each $2.50 spent over the bar.

There are fifteen saloons doing business now, and others are preparing to open every day. The receipts for sixty days last spring in one saloon amounted of wages of from $10 to $15 a day is taken into consideration the charges appear reasonable. Meat is sold for 75 cents a pound, and at one time during the summer ice sold for $1.50 a pound. Some enterprising fellows went down the river a short distance and found a small glacier and realized a neat sum in selling the ice to the saloons.

The laundries charge $1.25 for washing and ironing a white shirt and 75 cents apiece for flannels. Shaving is 50 cents and a hair cut is $1. Loaves of bread, and small ones at that, find ready sale at 50 cents.

It is my honest conviction that no community or mining camp of this size ever had so many dogs. It is estimated that there are nearly 1,500 of the animals in the mines.

The most of them are fine-appearing fellows, and in the cold season net their owners handsome profits by hauling sleds heavily laden with supplies to the adjacent mining camps. In town they travel in companies ranging from ten to twenty head, and the moment they catch sight of another dog away from his company the pack will give chase, and if caught will whale the life out of the unfortunate. Dog-fights are so common as not to attract a passing glance.

Thieves? These animals are capable of convincing the most skilled professional petit larcenist that he does not understand the first rudiments of the profession. They will lie around in sight of a cabin for hours, waiting for the owner to depart, and then deftly leap through double panes of glass and carry off a side or two of bacon. It is necessary to erect caches fifteen or twenty feet above ground to store such goods.

Weather in Winter.

The weather in the winter averages about 45 degrees below zero, and last winter for two or three days it hung around 59. One or two instances are remembered by some of the pioneers when the instrument registered 84 degrees, and that was cold weather, they say. When it is colder that 40 degrees there is no wind. The river freezes and jams so full of ice in places that it is impossible to drive dog teams, and it frequently becomes necessary to resort to inland travelling.

There are two churches, Catholic and Episcopal, and a sisters' hospital in Dawson City, and the attendance is good. In the hospital are several patients, some of whom are suffering with typhoid fever, but one has the malaria.

The expense of freighting supplies to the mines in Eldorado and Bonanza Creeks, a distance of fifteen or twenty miles, is high, a rate of 50 cents a pound being charged. The trail is marshy and in some places full of boulders and quite steep, rendering travelling tedious and difficult.

The amount of gold taken out of the Klondike district in the past eleven months is astonishing. Whether other gulches with riches equal to those of Eldorado and Bonanza Creeks will be discovered is the problem of the hour. Opinions differ materially, but the majority seem to think that before the approaching winter is over pay streaks on other claims will be found that will parallel last winter's discoveries.

All Have the Gold Fever.

Everybody is at a feverish heat and ready for a grand rush to any new diggings. The slightest word or gesture on the part of some of the men supposed "to be on the inside" would precipitate a panic and almost depopulate the town in a day.

It was only a few days ago that somebody whispered around that good prospects had been found in Sulphur Creek, and a big rush to the field took place.

Women joined in the scramble, some of them closing their restaurants and laundries. Every piece of land from one end of the creek to the other was staked out and prospect holes are now being sunk, but owing to the marshy condition of the soil definite results cannot be had before the frosts of October come around.

All along the gulches of Eldorado and Bonanza Creeks are cabins in which are cans of gold exposed and unprotected. More care is exercised in guarding and protecting bacon and flour than the bright yellow gold, fresh from its state of virginity. It is impossible to estimate the amount of gold that is being taken out every day.

Many men are realizing handsome revenues from "working claims on the lay," that is to say, the owners rent out their properties to workmen for one-half of the gold product. W. J. J.

SAN FRANCISCO CHRONICLE, SATURDAY, DECEMBER 4, 1897.

A NATIVE ALASKAN STRIKES THE CITY.

"Indian Charlie," Who Accompanies "Swiftwater Bill."

JAMES W. BOYLE, manager of the pugilists, Frank Slavin and Frank Rafael, arrived here from Dawson City yesterday, accompanied by "Swiftwater Bill," one of the most picturesque characters of the Klondike, and "Indian Charlie," a famous Yukon Indian guide. The visitors are guests at the Baldwin.

The Indian of the party is one of the most interesting visitors that ever struck San Francisco. He has the distinction of being the first Yukon Indian

that ever visited the city, and he is proud of the fact. Metropolitan life is all new to him, for until the party reached Seattle some days ago he had never seen a two-story building. He is learning rapidly, however. When he went out to explore the city yesterday afternoon he cut notches in all the telegraph poles along his route so he would not lose his bearings, and was on the verge of blazing the walls of the Baldwin Hotel last evening when he lost the trail from his room to the hotel office when the friendly face of Boyle loomed up on his horizon.

Boyle and "Swiftwater Bill" are on their way to Woodstock, Ontario, to gather together enough dogs to transport sixty tons of freight over the Dalton trail in the spring, and they are taking the Indian along to train the dogs. "Indian Charlie" is the chief of a small band of his fellows at Carmack's Post, thirty miles above Five Finger Rapids, and until the gold craze struck the country eked out a comfortable existence trapping and trading.

"Swiftwater Bill," otherwise known as William H. Gates, is a noted character on the Klondike. He was given his picturesque pseudonym after rescuing a party of prospectors from a rock in one of the rapids of the Yukon, and the name has stuck to him ever since. Although a mild-mannered personage, he is credited with enough courage to stand off all the gun fighters in the new gold diggings, and he is also reputed to be one of the wealthiest claim-owners in the northwest, his fractional interests in various mines amounting to about twenty entire claims, one of which, No. 13 on El Dorado creek, is said to be the richest in the entire Klondike country. Among his other claims to distinction is the fact that he conducted the only faro game in Dawson that had no limit. He cleaned up $30,000 in three nights, but lost part of it subsequently.

Speaking of the situation in Dawson yesterday Boyle said that, in view of the fact that he and the members of his party left there September 24th, he had no late intelligence from direct sources.

"I fear, however, that there is going to be great suffering there this winter," he said. "Not less than 3000 people reached Dawson after the 1st of September. While coming out we passed thirty boats a day with parties going in, and you couldn't have driven them back with a gun. They all believed that supplies were plentiful in Dawson and were going in with only a few days' supplies."

Boyle says that Slavin and Rafael are doing well, being interested with himself in several claims that promise to turn out big. They gave one sparring exhibition in Dawson, and Rafael has been matched to meet a fighter from Circle City named McKenzie in the spring. In the meantime they are digging gold out of the ground.

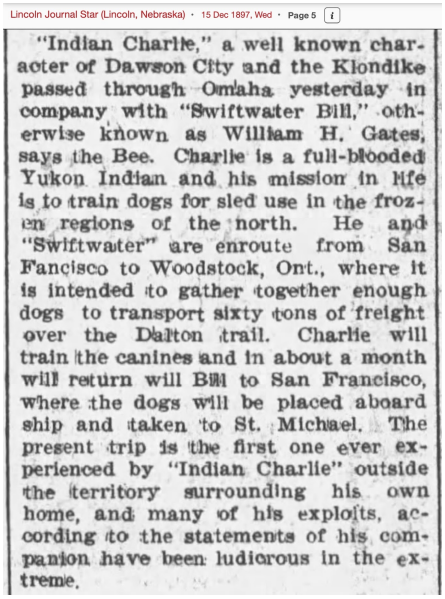
Stillwater Bill passing tjrough Nebraska ? From San Francisco going to Ontario ?? Full newspaper page : [HN014I][GDrive]



Lincoln Journal Star (Lincoln, Nebraska) · 15 Dec 1897, Wed · Page 5

"Indian Charlie," a well known character of Dawson City and the Klondike passed through Omaha yesterday in company with "Swiftwater Bill," otherwise known as William H. Gates, says the Bee. Charlie is a full-blooded Yukon Indian and his mission in life is to train dogs for sled use in the frozen regions of the north. He and "Swiftwater" are enroute from San Fancisco to Woodstock, Ont., where it is intended to gather together enough dogs to transport sixty tons of freight over the Dalton trail. Charlie will train the canines and in about a month will return will Bill to San Francisco, where the dogs will be placed aboard ship and taken to St. Michael. The present trip is the first one ever experienced by "Indian Charlie" outside the territory surrounding his own home, and many of his exploits, according to the statements of his companion have been ludicrous in the extreme.

SWIFTWATER BILL IN TOWN.

Paid a Short Visit to Old-Time Friends in Spokane.

"Swiftwater Bill," which is the Klondike name of William H. Gates, a former resident of Spokane, but now a Bonanza creek millionaire, is in the city visiting old friends. He was not known as "Swiftwater" during his residence here, but from all accounts developed a large amount of swiftness in the icy north and fairly earned the sobriquet. Mr. Gates has occupied a prominent position in the public eye, since his return to civilization with big bags of nuggets, by undergoing a matrimonial experience which left him a sadder but wiser man. He will return to Dawson City this month to operate his claims, also the biggest dance hall in the camp. He goes to the coast this morning.

Broke Again

Swiftwater Bill Up Against It in London

"Swiftwater Bill" Gates, famous as one of the original Klondike kings and as a Tanana capitalist, but no less famous for his many matrimonial ventures, is walking the streets of London in that financial stringency termed "stone broke." By means of the postal service he is yelling loudly across the Atlantic Ocean for help from W. H. Dohrmann, formerly a well known Alaskan, now manager of the St. Francis hotel, of San Francisco.

This is the news brought from San Francisco to Seattle by Jack McLeod, a former Alaskan and a friend of Swiftwater Bill, who has recently arrived in Seattle from Rawhide, Nevada, from which place he was accompanied by James McTavish another Alaskan who cleaned up a small stake on Candle creek.

According to McLeod, the treeless tundras and frozen streams of the North now look pretty good to Swiftwater, and, at the time of writing, he desired nothing better than to be lost in a blizzard on the Chilkoot summit. Gates says that it is cold in the northern part of Alaska, but not half as frigid as was his reception by the English nabobs when he tried to persuade them to buy stock in some mines which he owns at Rawhide.

At a cost of more than $30,000, Gates installed a mill on his Rawhide property, but its operation was distinguished chiefly by its failure to yield the expected harvest. After vainly trying for two years to make it pay, Gates hied himself to the country that is supposed to be impoverished of aspirates and gave the residents a chance to invest.

Not the kind of man who can give a waiter "twopence" for a tip and get away with it, and always spectacular to the last degree, "Swiftwater Bill" engaged rooms at one of the most fashionable hotels on Piccadilly, and while distinguishing himself by handing out stupendous tips to the hotel help, he, at first calmly but later feverishly, waited for the rush of capitalists to buy his stock. The rush failed to materialize, and he is now casting longing looks at the waters of the Atlantic and wondering whether he can obtain a job on a cattle boat bound for the land where gold comes in bunches and the divorce laws are not too stringent.

Research Articles on "Swiftwater Bill" / "William Charles Gates (born 1860)

Everything2-com article on "Bill Gates"

Source - https://everything2.com/title/Bill+Gates

While there may be a Bill Gates very famous at the end of the 20th century and into the 21st, there was an equally notorious character with the same knack for making money, who went by the same name at the end of the 19th century and into the 20th.

"Swiftwater" Bill Gates or Swiftwater Willie was one of the most colourful of the colourful and legendary crowd that amassed in the arctic reaches of the Yukon when gold fever struck the Klondike. He was, it is said, an unassuming, round-faced man of about five feet, who was working as a dishwasher in Circle Creek, Alaska, when gold was found around the Klondike river. His origins and date of birth are unknown but he claimed to be from Idaho where he had supposedly been a boatman on the Coeur d'Alene river, hence his nickname. He never did prove that he actually could steer a boat safely through any rapids.

It's hard to separate myth from reality in the often unbelievable life of this man and assembling all events in a coherent timeline is a task in itself. There was more gold than paper and more brawlers than scribes in the Dawson City of the late 1890s so what did make it onto the record was part fact, part frontier lore. Such was his legend and the nature of his exploits that the first publication about him was by a disgruntled mother-in-law in 1908, while he was still very much alive and kicking. A consummate swindler and given to extravagance on a grand scale, gold and money managed to flow through his hands faster than the rapids of the Idaho river he called home.

Being in Alaska when gold was found he managed to get to Dawson City and make good money long before the mass of fortune-seekers arrived from the south. He never staked a claim himself but obtained rights through shrewd trading and working others' claims for a share of the gold, ending up with enough money to lease a stake in a claim another prospector did not want to work himself, along with six partners. When his group of diggers hit the motherlode they hid it and bought the claim which so far they had only leased for 50% of the gold found. Thus they cheated its owner out of at least $45000 (unethical business practices, anyone?). The claim on the tributary stream of the Klondike named Eldorado #13 was not only lucky but one of the richest claims of the gold rush. Gates and his friends became Kings of the Klondike but none, it seems, conducted himself less regally than Swiftwater Willie.

After that big hit, he went on and bought more claims, paying newcomers to dig them in return for a parcel of the claim, and made even more money, becoming possibly the richest miner in Dawson City. And while his pockets were literally lined with gold, his mind was a dungeon of moral depravity by the standards of those days and not much better by today's. He lost immense amounts gambling, challenging people to seven-thousand dollar wagers and blowing thousands more at the poker table, where his charm helped him little. In a town where gambling was everyone's favourite pastime and conducted with deadly seriousness, Gates still stood out as a prince among losers. In the end he bought a share in the Monte Carlo gaming parlour and helped elevate it from tent to unsavoury Mecca of gambling. When he was broke, he borrowed money at astronomical rates and blew that too before he made enough from his claims to pay it back. His gambling philosophy was simple: "The sky's the limit! Raise 'er up as far as you want to go, boys, and if the roof's in your way, why then tear it off!"

Nowhere though were his exploits more infamous than in the realm of romance. While he was one of the few prospectors who didn't engage in the other sport of the times--drinking--he was definitely into young girls and promised himself and the Monte Carlo the prettiest dance-hall girls that money could lure to the frozen north. He had already demonstrated his fondness for these girls by letting them gather gold on his own claims and went on a trip to San Francisco to find both the girls and the fancy booze and trappings that would make the Monte Carlo dazzle one and all. With him went one of the girls, by the name of Gussie Lamore.

Gussie was only one of the three Lamore sisters Gates courted. Gussie was the real prize and she figures in the most famous of all Klondike tales--the "Egg Story." The year was 1897 and the exact circumstances of the event are unknown but the basic idea was that Bill Gates bought every single one of the scarce fresh eggs in Dawson City at a dollar a piece because of her reputed fondness for them. According to different versions of the story, he did it to impress her, to make her come to him to get them or after seeing her order them while with another man. Nobody knows exactly how many eggs there were and reports vary enough to cast doubt on any figure. He certainly did corner the market. Sound familiar? What he did with all those eggs is also uncertain but he may not have given them all to Gussie as it was said. By some accounts he fried them himself and tossed them to the dogs, by others he gave them away to all the other girls.

In San Francisco he truly lived like a king and squandered his capital on eccentric luxuries like champagne baths in first-class hotels, tipping people with gold dust and blowing $15000 on the Oakland mansion that he and Gussie's sister, Grace, would spend three married weeks in, after which she kicked him out. Having thus been rendered once again single and skint he went in search of someone who would fill his purse. Gussie had, in the meantime, dumped him and returned to her husband (after promising to marry Swiftwater Willie, she wasn't much of a saint herself).

On his way back north a lady by the name of Iola Beebe sought him out in Seattle. At the same time the man he had borrowed $20.000 from in San Francisco, money which he used to buy furnishings and hire girls for the Monte Carlo, a certain Dr. Wolf, was having second thoughts and was also pursuing him to recover his cash. Dr. Wolf would eventually catch up with him in Dawson City and get his money back, leaving Bill Gates $20.000 in the hole with his Dawson City creditors. Now, Iola Beebe was a widow infected with the gold fever of the times and had $35.000 at her disposal with which she intended to build an inn in Dawson City. More than her financial assets though, our man Bill was attracted to her teenage daughters. He did try to elope with both but was caught before the ship left port. Although he had to leave alone this time, they would meet again in Skagway.

The second time he succeeded in running away with a girl and getting married in Dawson City. By the time Mrs. Beebe caught up with them it was a fait accompli. Bill did not only manage to charm himself out of his new mother-in-law's doghouse but also talked her into investing her fortune in a mining concession called Quartz Creek which turned out to be a dud. In debt to the tune of $100.000 he decided it was a good time to disappear. Their child was left with grandma and he and his wife took off for Nome where gold had been found. This is where he dumped his young wife Bera and ran off with his sister's seventeen-year old stepdaughter, Kitty Brandon. With his own sister in hot pursuit, he made it back to Washington State and there he married the girl. A few months later he would abandon her too.

He hadn't done too well in Nome, blowing the few thousand dollars he made gambling. Incidentally, he was not the only man to head for Nome in 1899. In the same gold rush in the same town there was another Bill Gates, who would later be Bill Gates Sr. of Bremerton, Wash., great-grandfather of none other than William Henry Gates III. It's not known whether Microsoft's 'Yukon' project codename has anything to do with the Bill Gates of old.

Bill now had not one but two mother-in-laws after him. Iola Beebe caught up with him once and he miraculously got away with her confidence and money once again. This time to Fairbanks where he managed to strike it rich yet again. Once back in Seattle, Mrs. Beebe found him again and this time was taking no prisoners... or rather, she was and had him thrown in jail for bigamy. He once again demonstrated his extravagant ways by presenting the lawyers, a judge, sheriffs, and court reporters with gold nuggets wraped in twenty-dollar bills and, to top it off, talked Mrs. Beebe into posting his bail. After that he got himself out of the jam by divorcing both women.

Very little is known of his whereabouts and activities after 1908 but one is inclined to believe that he continued to make money and blow it like nobody's business, though on a less grand and documented scale. He died in 1935 while negotiating a huge silver mining concession in Peru. Of all the odd characters

digging their way through the fortunes of Alaska and the Yukon, he was certainly one of the oddest. While the women in his life may have disagreed, to anyone who takes interest in the madness of those times "Swiftwater" Bill Gates was one unforgettable fellow.

Surname research on "SelectSurnames 2.com"

http://www.selectsurnames2.com/gates.html

One researcher went through Gates as a surname in the 1850 and 1860 US censuses and estimated that a majority of them had German rather than English roots. Many **Goetz became Gates** in America on arrival or a generation or so later.

Among the Goetz who came to America and became Gates then or later were:

- Early arrivals, John Georg Goetz along with his mother and siblings, who left Wurttemburg for America in 1750 and settled in Berks county, Pennsylvania.
- Johannes Gotz from the Rhine Palatinate arrived in 1754 and settled in Indiana county, Pennsylvania
- Adolph Goetz and his family from Wurttemburg who moved to Buffalo, New York in 1846 (another Goetz, George Goertz, settled in Rochester nearby and later moved onto Indiana and Ohio)
- Daniel Goetz and his family from Wurttemburg who arrived in Iowa in the early 1850's to farm
- and a Goetz family from Nuremburg who started emigrating to America in 1853. They settled in Angola, Indiana.

There were two Bill Gates known to be in Alaska at the time of the Klondike gold rush of the 1890's. The first, the flamboyant Swiftwater Bill, was a small moon-faced wanderer from Idaho. He made and lost several fortunes. In one famous Klondike story he presented the Dawson dance hall girl Gussie Lamore with her weight in gold. A biography *The True Life Story of Swiftwater Bill Gates* was written in 1908 by his mother-in-law Iola Beebe. The other Bill Gates, whose family had come from Rhode Island in the early 19th century, settled in Washington state and was **the grandfather of Microsoft founder Bill Gates**.

Canada. The descent from New England immigrant Stephen Gates came north into Canada a century or so later, through two different lines:

- One was via his son Simon. Simon's grandson Captain Oldham Gates left Massachusetts in 1760 for what is now Annapolis county, Nova Scotia. His family founded Gates Breakwater, which became known as Port George in 1812, and were the builders of the first oceangoing vessel there.
- The other was via his son Isaac. There was a Joseph Abel Gates, who was born in Kingston, Ontario in 1772 and married Mary Burtch in 1802, and a Henry Gates, born in Burford in Brant county, Ontario in 1777.

1998 book - "Collected stories of the Yukon" by Sam Holloway

https://www.yukoner.com/collected_stories.pdf

1998-sam-holloways-collected-stories-yukon-reader-sam-holloway.pdf

[https://drive.google.com/file/d/1cnwNNi41O5YMJ-g1yLTkeqAADNx-g1I1/view?usp=sharing]

W. C. Gates lived out the fantasies of a repressed society, during an age when piano legs were draped with cloth to cover their “nakedness.” In his pursuit of gold, fame and women, he had more successes—and failures— than any man in the history of the North.

The first half of Bill’s life was easy to research because the press followed his every move. In one instance they sifted the ashes in his hotel fireplace for evidence of his sinning.

His disappearance from North America left most historians with little information to cover his later years. Now, thanks to an Alaskan prospector, the rest of Bill’s adventures have come to light. So here is the story, too outlandish for fiction or film—but true—of “Swiftwater” Bill Gates...

Alaska, 1896

Originally from **Redwing, Minnesota**, Bill first came into the Yukon sometime in 1895. He had played around with prospecting in the central States and had worked in a copper mine in Idaho. It was there that he heard about the gold discoveries in Alaska.

In 1896, Bill was washing dishes and making beds at a crudely-built log hostel in Circle City, Alaska. One night after supper, as he was cleaning up the dining hall, he overheard two men talking about the big gold strike in the Klondike.

Misty dawn found Bill poling a flat-bottomed boat upstream toward Dawson, 275 miles away. It was no easy feat. The Yukon River runs swift and the poler, using all his limbs and back to move against the current, must stay near shore in the shallow water. Hordes of flies and mosquitoes can attack him unmercifully. Bill knew how to handle boats, however. He often bragged of this ability and his pals dubbed him “Swiftwater Bill.”

His detractors—of which he was to have many—told a different story.

They said that on his initial entry to the Yukon, Swiftwater jumped out of the boat and walked around the notorious Miles Canyon and Whitehorse Rapids. After his companions put the boat through the turbulent waters, Swiftwater rejoined the expedition. And that, according to them, was how he came by his nickname.

His later adventures in the Yukon and on the upper rivers of the Ama- zon jungle lend more credence to the first story than the latter. Whatever the case, he did stand out from his peers by the very contrast he presented to them.

The men along the Yukon in those days were a hardy lot—perhaps the toughest, fiercest at work or play, most macho white men on the continent— while Bill was a short, small-limbed waif of a man. His slight paunch and indolent manner bespoke his aversion to hard work and danger. He sported an enormous black moustache and, in the manner of many small men, he spoke with a strident timbre when bragging of his accomplishments and bravery. No one took him very seriously.

All the claims along Bonanza and Eldorado Creeks had been staked by the time Bill arrived from Alaska but he and six others obtained a lay on Claim #13, Eldorado. They worked together to put a shaft down to bedrock and whooped for joy at what they found—coarse gold in a paystreak that seemed of endless width and length. At Bill's urging they covered up the incredible find and went to the owner of the claim with a joint offer of $40,000. They were willing to take a chance if he would sell this claim with the un- lucky number.

The owner fell for it and the boys soon brought him enough gold to pay off their debt. Before long Bill's (and the others') pockets and packsacks bulged with gold.

Into town he went, $20,000 richer, and hired newcomers to work his ground on a percentage basis. He then bought the best clothes he could find in Dawson and sported the only starched collar in town. Mining camp followers were descending on the Klondike from all over Alaska and these included quite a few hurdy-gurdy girls. In his princely manner, Swiftwater brought coveys of these females out to his claim to help themselves to some of his gold. He bought all the love and laughter that was available in the embryo town—even if they were laughing at him.

He loved to gamble. Never a heavy drinker, he gambled on any game he came across. He lost more often than he won. When he strutted into a sa- loon he yelled loud enough to be heard above the roar of the crowd:

"De sky's de limit boys! And if de roof 's in your way, why just tear it off!"

When professional theatre entertainment arrived in Dawson, one com- pany staged a satire entitled, *"The Adventures of Stillwater Willie."* Bill revelled in the attention it brought him and attended every performance. No one could say for sure whether the crowd laughed at him or at the show, but he minded not at all. Swiftwater Bill provided a spectacle in a town full of eccentrics. In his swan-tailed coat and diamond cravat, with his devilish black eyes and flowing moustache, he outshone all others in those heady days of easy fortune in the Yukon.

He met a man operating a saloon about a mile from town. The man's name was Jack Smith. Jack had come down from Fortymile with his variety troupe. He had staked a rich claim, sold it for $150,000, and was moving on to bigger and better endeavours.

He and Bill decided to build what was to become the most glittering pleasure palace ever to be seen in the North: the Monte Carlo Dance Hall & Saloon. While Jack looked after construction he entrusted Bill with the chore of going "outside" for a load of furniture, liquor and dancing girls.

In the days to come Jack Smith was to bitterly regret this decision.

Swiftwater and the eggs...

Meanwhile, Swiftwater began a stormy courtship of a buxom, platinum- blonde dance hall girl called Gussie Lamore. Gussie was the reigning queen of the muddy town and billed herself as *"The Little Klondike Nugget."* Bill offered Gussie her weight in gold if she would marry him. She stalled him by saying she was "not quite ready yet." (Unknown to Bill, she was married and had a three-year-old child.) One night he saw her dancing merrily with a big French Canadian. The ensuing argument touched off a legend that would earn Bill a new title: "The Knight of the Golden Omelette."

The story flashed up and down the creeks, from cabin to cabin, from camp to camp, from saloon to saloon until the whole Yukon knew the story, one version of it or another.

Gussie Lamore loved eggs. She could never get enough of them in Dawson, simply because there weren't any. Just about the time of her argu- ment with Bill, a shipment of eggs came into town by dogteam. Swiftwater bought them all, some 2,200 eggs at a dollar each. And that's what started the stories.

Arthur Walden, the well-known dogpuncher, said in his memoirs that Bill had the eggs fried in a restaurant and then threw them out, one at a time, to the dogs in the street.

Stroller White, the famous news columnist, said Bill kept the eggs un- der his bed at the hotel till they all turned rotten.

Others said Bill invited every dance hall girl in town for a feast of eggs, all except Gussie.

The Klondike Nugget dubbed Swiftwater *"The Knight of the Golden Omelette."*

Bill never talked about it at all. Some years later Gussie told the real story to a news reporter in Seattle:

"I met Swiftwater," she said, "in Dawson of '97. He certainly had the coin then. He lavished money on me but I got dead sick of him. He had no sense so I got to skating around with another guy. There was an egg famine come on in Dawson. I'd shaken Bill.

"I went down to the store to buy some eggs...Lordy how I wanted some eggs for breakfast. Well, Bill was in the store when I goes in. He sees I wanted the eggs and while I'm talking to the clerk, see, he buys up the whole con- signment of 900 eggs at $1 apiece. Then he says to me, 'Now my dear, if you want eggs for breakfast, come home where you belong.'

"Well, I was just dying for them eggs, and I came to my milk like a lady. I goes home with Bill."

In the fall of l897, Bill and a new friend of his, Joseph Whiteside Boyle (who would one day become a true Klondike King), Indian Charlie, and few others left Dawson for the "outside." Swift was to come back from the south with all the necessities for the Monte Carlo: booze, furnishings and, most important, women.

It was a hell of a trip for them. They poled a boat upstream until the river froze and had to wait a month at Stewart Island until the ice was solid enough to walk on. At last they were able to resume the journey but some- where on the river Swiftwater broke through the ice and big Joe Boyle fished him out.

Leaving the river, they hiked over the Dalton Trail to Haines Mission. The hundred-mile journey normally took about four days but in the extreme cold and snowstorms they struggled for 25 days before reaching the coast. Some of the party wanted to just "lay down and die." Swiftwater and Joe Boyle urged them on. At last they boarded a ship and arrived in Seattle on November 29th, two full months after leaving the Klondike.

Gussie Lamore, wise to the ways of the North, went over the ice that winter as a passenger in a dog sled. She met up with Bill in San Francisco. Klondike fever was just beginning in the west coast cities and Swiftwater was living proof of the riches to be had. He passed out large nuggets to the bellhops at his hotel to tell all comers that the man in the fur hat was

"Swiftwater Bill Gates, King of the Klondike."

Gussie took her well-dressed beau to meet her folks. Years later she told the story to the Seattle Washingtonian:

"In 'Frisco I introduced Bill to my family. Well, say, would you believe it, my sister Grace she cops him out—steals him from me cold and marries him.

"Well, say, she lives with him a couple of weeks and quits him. She couldn't stand him at all. She leaves their rooms at the Baldwin and takes a flat. Bill, he goes to her room while she's away, wraps her silverware and other valuables in a sheet and carries them downtown on his back.

No woman could live with Bill...

Finally Grace she gets a divorce and her maiden name back and then, he steps in and joins up with my sister Nell.

"Nell only lived with him for a week. Then Bill tried to cop out this fourth sister of mine after Nellie shook him but he couldn't touch her with a ten- foot pole. That's where she's wiser than the rest of us.

"No woman could live with Bill. He's one of those camp guys that never had any money in his life till he got a great big bunch of it all at once. He doesn't know nuthin' except to tell everybody he's lousy with the yellow stuff. He'd throw dollars into the crowds just to see 'em scramble and let 'em know he had it to trown (sic) at the birds. He'd tip bellboys with $5 gold pieces and buy wine at show prices by the barrel."

"Hasn't a particle of intellect; couldn't carry on a conversation to save his soul. He's no company for a woman and still he's jealous if a woman only looks at another man."

"Say, did you ever see his get-up? Well, you ought to. He wears a plug hat of the vintage of '75; then he wears a Prince Albert coat and a negligee shirt that cost him a dollar and a quarter. He tops the whole thing out with dancing pumps. Why say, he's a regular mark."

From then until the day he left North America, newspapers tracked Bill's every move. They delightedly reported on his affairs with the Lamore sisters. What they could not find out directly they made up from the slight- est rumours. Even up north in Dawson the Klondike Nugget said Bill had "bought Grace Lamore a huge white mansion" and after the breakup he "made off with $7,000 worth of wedding gifts." With his love of exaggeration and the newspapers' wild reporting, the legend of Swiftwater Bill, the Klondike Prince, grew and grew. His name was a household word all over the U. S. and Canada.

Jack Smith in Dawson cringed every time he read a new story about his "partner."

Bill's money was fast running out. Not one item had yet been purchased for the Monte Carlo. The Lamore sisters had taken him for about $100,000 and his every action as a Klondike King cost plenty. He holed up at the Pal- ace Hotel in San Francisco, keeping a low profile. About this time a rich doctor came to see the "famous mining magnate" at his suite of rooms.

Swiftwater regaled Doctor Wolf with tales of the Klondike and painted a glowing portrait of the opportunities there for someone with money to invest. Quickly they formed a partnership. Together they would create a vast trading and transportation network stretching from Skagway to Circle City. In the meantime could the doctor advance Bill some funds? At one hundred percent interest?

With $20,000 of Doctor Wolf's money in his pocket, Swiftwater took off to Seattle. In that fair city, which was the main jumping off point for the Klondike stampeders, he set about gathering supply contracts for the new business. At the same time he rounded up a group of women to work in the Monte Carlo and bought furnishings and supplies—mostly on credit.

The winter of l898 was half over. The entire world knew about the gold in the Klondike and some 100,000 people made plans to go there. The sup- plies and services they bought gave a tremendous boost to the cities along the west coast. In the midst of all this bustle Swiftwater showed them that a man really could come out of the Klondike with a fortune—and then just go back for more.

Around and around Seattle he paraded, surrounded by a group of at- tractive women. Very few knew that these laughing members of his "harem" were on the payroll of the Monte Carlo. In his Klondike costume—fur hat, parka, mukluks—he caused a sensation wherever he went.

After one party at the ritzy Rainier-Grand Hotel the management pre- sented him with a bill for damages amounting to $1,500.

He bought champagne by the case and invited reporters to watch him bathe in it. When one reporter asked for an exclusive interview, Bill told him it would cost him $l,000 a minute.

Doctor Wolf, seeing all the stories in the papers, sent word for Bill to hurry up with the arrangements so they could be on their way to the Klondike.

Bill planned to leave soon anyhow. He was again running low on funds. He and his "staff" boarded a ship for Skagway. They partied all the way under the disapproving glares of Doctor Wolf. They had to wait for a month in Skagway for the Yukon River system to thaw and had another wonderful time as they waited. Doctor Wolf hired a dogteam to take him over the ice to Dawson. Soon after he arrived there he heard some very disturbing ru- mours about his partner.

Jack Smith flew into a rage every time someone mentioned Swiftwater Bill. Eugene Allen, editor of the *Klondike Nugget* newspaper, had this to say:

"Swiftwater has never been known to pay back any money after it was thrown away. If he made another lucky strike somewhere, he might toss some your way, but that's about your only chance."

Return to the Klondike...

One day the word flew around the City of Gold: Swiftwater Bill Gates and his party were just upstream, round the big bend in the Yukon River. They would be arriving at any moment. Soon a large crowd milled about on the waterfront.

They were well rewarded for their patience. In the prow of a Peterbor- ough canoe stood Swiftwater, posing grandly, all decked out in his Prince Albert coat and silk top hat. Beside him a dance hall girl perched beautifully on a whiskey keg. Behind the canoe came two barges piled high with crates. On these crates sat many more smiling, painted women wearing low-cut evening gowns. The men on shore cheered wildly, the girls waved back at them, and when the convoy nudged into the dock, all the men pitched in to help the girls ashore.

In the meantime, Jack Smith and Doctor Wolf were elbowing their way through the crowd. They grabbed Bill from both sides.

"Swiftwater!" roared the doctor, his face red as a beet. *"You've got ex- actly three hours to pay back the twenty thousand! Never mind the inter- est! Just get my goddam money!"*

Somehow Bill borrowed enough money to pay the doctor, sans interest, and arranged to turn his share of the Monte Carlo and some earnings from his claim over to Jack Smith. He was clear of his creditors and then sold his interest in the Eldorado claim. He still had a claim on Sulphur Creek and was ready for some new action.

He staked out a three-mile mining concession on Quartz Creek. Joe Boyle did the same on other creeks and somehow they obtained title from the Canadian government in Ottawa. Partners now, the two of them sailed to London, England, to raise capital for the first large-scale mining opera- tion in the Yukon.

Swiftwater and Boyle formed an odd couple. Bill was tiny and ostenta- tious while Joe Boyle was a big, quiet man who needed no fancy attire or braggadocio to prove his manhood. While Boyle attended to business, Swiftwater caused a sensation in the courts of Europe.

Swiftwater dazzles Europe

Dubbed the *Klondike Prince* in the press, Bill told reporters he would bet $7,000 with any comer on one turn of a card. He visited Paris where beautiful women swooned over this flashy "millionaire" from the wild fron- tier. Finally Joe Boyle sent Bill and a British mining expert to San Fran- cisco where they were to arrange the purchase and shipment of mining equipment to the Klondike. Attended to by barbers and shoeshine boys, Swiftwater again became the most celebrated man in the city.

About this time a woman planning to ship a hotel piecemeal to Dawson City visited Bill at his hotel. She wanted some expert advice on conditions in the North. She was Iola Beebe, an attractive, matronly widow with two beautiful daughters.

For the rest of her life she would lament the day she introduced herself and her daughters to Swiftwater Bill Gates.

While Mrs. Beebe explained her plans, Bill gazed lecherously at 19- year-old Blanch. His business associate, the British mining engineer, lent such an air of respectability to this little group that Mrs. Beebe had no suspicion of the undercurrents of lust flowing beneath all the talk. She received the first of many great awakenings when she found the following note on her mantel:

"Dear Mama. We have gone to Alaska with Swiftwater and Mr. Hathaway. Do not worry, we will look out for your hotel when we get there. Bera."

Bera was l5 years old at the time. The hysterical Mrs. Beebe stormed onto the steamer Humboldt, which was just about to depart for Alaska, and found her girls in a cabin. Swiftwater hid under a lifeboat but the ship's officers located him. The police were summoned and the captain of the ship chafed at the delay while Bill gently persuaded Mrs. Beebe of the honour of his character.

She agreed to let the ship sail—minus her daughters. They all met up again in Skagway a few weeks later. Mrs. Beebe watched over her girls night and day but to no avail. She found another note in her room:

"*Dear mama. I have gone to Dawson with Swiftwater. He loves me and I love him. Bera."*

The chase was on.

Mrs. Beebe arrived in Dawson to be met on the dock by Bill and Bera, who were now husband and wife. Marriage sanctified the whole relation- ship—so much so that Bill soon had $35,000 of his mother-in-law's money invested in his mining operation. They all moved out to Sulphur Creek for the winter and Bera gave birth to a son.

Alas, things were not working out for Bill. His gambling and mining debts piled up. He flirted with Gussie Lamore who sang to him from her spot on the stage but he couldn't take her up on the offer without money, lots of money. (She would sing an old song, *"He Certainly Was Good to Me"* to the delight of the crowd. Of course Bill sent up champagne to the cast, as any good sport should.)

He bought a small boat, packed Bera into it, and they set out for the ruby sands of Nome, leaving behind a destitute mother-in-law, the baby, and $l00,000 worth of bills. Too broke to follow her slippery son-in-law, Mrs. Beebe existed on charity until she received a letter from Swiftwater. He had recouped his fortunes on Dexter Creek just out of Nome and she must join them there as soon as possible.

Off she went, down the Yukon River by sternwheeler. The trip was long— long enough for her to hear that Bill was gambling heavily—and losing. When she finally stepped ashore at Nome, Swiftwater was gone. In fact, a Seattle newspaper had already arrived and there was Bill in the headlines:

SWIFTWATER BILL RUNS AWAY WITH ANOTHER WOMAN!

Indeed, he had covered a lot of ground while Mrs. Beebe had been on her l500-mile trip down the Yukon River. He had left Nome with Bera. It was now fall, l900, and they went to Washington where he happened to meet up with his sister's step-daughter, Kitty Brandon, at an Elk's carnival in Tacoma. In love again, he abandoned the pregnant Bera and eloped with Kitty, who was l6 years old at the time. The couple honeymooned at a posh hotel in Seattle.

In the meantime Mrs. Beebe had arrived on the coast. Now three furi- ous women were searching everywhere for Swiftwater: Bera, Bill's sister, and of course Iola Beebe. It was his sister who caught up to him first.

Bill looked down from his hotel room window and spotted his sister rushing up the steps to the lobby. Quickly he and Kitty scrambled down a fire escape and went back to Tacoma. Leaving her behind, Bill rode a train to Butte, Montana.

Who should be there but Gussie Lamore, just home from Dawson. She and her sister Belle were singing at a local nightclub. Bill signed over a part interest in a Nome gold claim to Gussie and she let it be known that she and her old love might marry. Suddenly Belle Lamore and Swift went missing from Butte.

a Nome gold claim to Gussie and she let it be known that she and her old love might marry. Suddenly Belle Lamore and Swift went missing from Butte, Montana. Soon Gussie received a wire from her sister: Belle and Swift had married and chartered a Pullman car for New York City.

This marriage (he now had three official wives) cooled off very fast and Bill drifted back to Alaska, this time to the Valdez area where he took up prospecting again.

For once he had poor luck and using an assumed name (Williams), he returned south and holed up in a room at the Victoria Hotel in Seattle.

Bill recoups his fortunes...

His reverie of self pity was shattered by a loud pounding on the door. He opened it just a crack and staggered backward. Mrs. Iola Beebe shoved the door open and flounced into the room.

Partially naked, Bill leaped onto the bed and pulled the covers up over his face. In the meantime his mother-in-law screeched out all the bitter- ness that boiled inside her. He beseeched her to leave him alone. He was finished, he said, all washed up and ready to die.

When at length she took a good look at the scruffy, sorrowful-looking waif on the bed, her maternal instincts awakened (or was it something else?) in spite of her anger. Bill quickly noticed the softening of her resolve. Soon he had her listening raptly to his tale of woe: how sorry he was for his mistakes and how he had only one chance to make amends—that was to head north again to the newly discovered Tanana River goldfields in Alaska.

Mrs. Beebe went out and pawned her jewellery to grubstake the new adventure. Afterwards she was amazed at how quickly Swiftwater became his former self.

From Dawson City he hiked over the trail to the headwaters of the Tanana River. He was seen tramping into Fairbanks wearing one rubber boot, one rubber overshoe, and his old yellow mackinaw. There, among many old cronies from the early rush into the Klondike, Bill obtained a partial interest in a couple of claims on Cleary Creek. They turned out to be in- credibly rich.

A small settlement grew up around his claims. They named it Gates City, in honour of Bill who, besides his womanizing and gambling, was famous for being able to spot a likely

piece of ground. Word of his new for- tune got around. Soon, two very de- termined women waited in Fairbanks for him to come out of the bush—-Iola Beebe and Bill's sister (the step- mother of Kitty Brandon).

Packing a suitcase full of gold, Swiftwater boarded a sternwheeler for the coast. Mrs. Beebe, now well- tuned to his devious ways, booked passage on the same boat. She kept her eyes on him for the entire jour- ney. At St. Michael, Alaska, they changed to a ship and again she never let Bill out of her sight.

A lechorous monster...

When they reached Seattle, Swiftwater jumped onto a barge and then to shore before the ship was fully docked. Mrs. Beebe set police and private detectives on his trail.

They scooted him out of a Seattle bar and into jail went Swiftwater; the charge, bigamy.

He had hidden his gold and Mrs. Beebe couldn't touch his mining claims. Through prison bars he persuaded her to bail him out. He would retrieve his gold, pay her some money, and straighten out his affairs. Part of the deal was that Bera must grant him a divorce so he could shake the bigamy charge.

Mrs. Beebe arranged everything and Bill was let out of prison. He eloped again—with Kitty Brandon. So far Mrs. Beebe hadn't received a penny from her slippery son-in-law.

Incredulous reporters sought her out for the story. The ensuing news- paper coverage must surely have encouraged other mothers-in-law to look more kindly on the men their own daughters had married.

Swiftwater divorced Kitty and went back to his claim in Alaska. Mrs. Beebe, upon learning that he had taken another $200,000 worth of gold from the ground, decided to make another attempt to gain redress from Bill— the man who had ruined her life. She caught up to him on a side street in Fairbanks.

She grabbed him and shook him like a mother would an errant child. He pulled $50 from his pocket and as she reached for the money he slipped away from her and ran off down the street.

That was the last time Mrs. Beebe ever saw Swiftwater Bill Gates. Somehow he clambered aboard a departing boat and returned to the south where he declared bankruptcy.

He had already signed his claim over to a friend in Fairbanks. Unable to touch his resources, his mother-in-law garnered some measure of re- venge by publishing a book on Swiftwater. The book described Bill as noth- ing more than a *"cowardly, dastardly scalawag"* and a *"lecherous mon- ster."*

Swiftwater Bill joined a silver rush to Peru after that. He was only seen in the U. S. a few more times, and never again after l908. His name disap- peared from the press.

Epilogue

In spite of his prowess in the mining business and his abilities in the northern wilderness, folks always thought of Bill as being something less than a real man.

They laughed at his clothes, his many marriages, his gambling, his es- capades. Yet, in many respects he was a gentleman. He took the insults and exaggerations with good humour and went on looking for gold or for another wife. When he disappeared from North America around 1910, the newspapers—who had hounded him so mercilessly—forgot about him. But the stories about Swiftwater lived on, repeated in almost every book deal- ing with the Klondike Gold Rush. Even today books are going into print that rehash the old stories about Swiftwater, most of them only partly true.

In 1985, I wrote to various historians and to newspapers and libraries, to everyone I could think of. Whatever became of Swiftwater Bill? No one seemed to know. The only clue was a picture and short death notice that appeared in the August, 1950, edition of the *Alaska Weekly*. Further check- ing proved the picture to be of Bill McKay, an Alaskan state senator who came to the Klondike in 1898.

In 1986, I received a letter from Fairbanks, Alaska. It was from Paolo Greer, an Alaskan prospector and adventurer who had given lectures and slide

presentations on his expeditions to Peru. Paolo had called at the of- fice of the *Fairbanks Daily News-Miner* just as my letter requesting infor- mation on Swiftwater had arrived at the editor's desk.

Would I like to know, asked Paolo in his letter, about the final years of Swiftwater Bill? He had just returned from Peru and had some informa- tion. I answered right away. Soon I received a package containing pictures, magazine articles (from Peru), old letters, etc. from which I pieced together the story.

Swiftwater was murdered on February 21, 1937, twenty-eight years af- ter he was last seen in Alaska. The shooting took place in a tiny hut on the Tunquimayo Tributary of the Nusiniscato River in the Quispicanchi District of Southeastern Peru.

A young man named Eduardo Gonzales called Swiftwater up to the sleeping loft of the hut. When Bill's head appeared at the top of the ladder, Gonzales blasted him with a heavy-gauge shotgun.

Eduardo was one of two brothers working for Bill. They killed him for his gold—which they didn't find hidden under the bed—and his tools. The brothers disappeared after the killing and were never seen in the district again.

At the time of his death Swift was 68 years old. He was still prospecting and mining and had big plans for the future. The State Department found it convenient to call the death accidental rather than investigate the murder of another "gringo."

The cabin where Bill was shot no longer stands. His grave site close by was long ago dug up and run through a sluice box, a very fitting tribute to a man whose life always centered around gold.

The three little jars of gold under Swiftwater's bed had been saved by him for a project dear to his heart: he was going to take his daughter, Lydia, to the U.S.A. where they would find her a gringo husband. Swift had met Lydia's mother, Victoria, in 1917 and took her to the jungle with him where Lydia was born. Bill might have married Victoria, who was 16 when he met her, but her parents disapproved of him and would not consent.

Lydia last heard from her father in late January, 1937. He wrote her a letter telling her not to buy clothes or anything; they would obtain every- thing in the U.S, It was the last anyone heard from the one-time greatest high roller of the north.

Swift had other women during his 27 years in the jungle. The press couldn't follow him around like they did in North America so there aren't many details in print. He did have a son by a woman, Marina, in Aporoma, Peru. In general folks said that Bill was a generous man who had no en- emies and that "la ruina de Gates era el juego" (Gates' ruin was gambling).

It can be safely conjectured that from 1910 till his death in 1937, Bill had found his niche in life—mining, guiding the occasional exploration party, chasing young women, gambling, and scouring the Amazon jungle for an- other big strike—which he never found. In North America he went to great lengths to prove to the world that he was a man in spite of his faults. Down here in the jungle that sort of stuff didn't matter.

He was influential in bringing the first big gold dredges into the coun- try and taught his prospecting skills to anyone interested.

The upper Amazon River country, where Bill spent the best years of his life, is a dark forest intersected by countless rivers and smaller streams. Sharp vines, lightning quick vipers, anaconda snakes a foot thick, armor- plated scorpions—with legs and antennae a foot long with lobster-like claws—ants almost two inches long, tropical warble flies, legions of biting insects, rabid vampire bats, voracious piranha fish—these are just a few of the hazards he faced on his travels through the jungle. Yet he did so as easily as any native.

The story of Swiftwater is an age-old tale: a man finds gold, squanders the riches from it, then searches for more. Soon the search itself becomes the all-important motif in his life. All else—sex, material possessions, fame, whatever, are only temporary diversions from the search. Robert Service, Bard of the Yukon, explained it better than anyone:

"...it isn't the gold that I'm wanting, So much as just finding the gold.

Book - Note tht Iola Beebe is is "Mother in-law"

Source - [HB004J][GDrive]

LITTLE, low-eaved, common, ordinary

looking road house, built of logs,

with one room for the bunks, another

for a kitchen and a third for miscellaneous

purposes, used to be well

known to travelers in the Yukon

Valley in Alaska at Circle City. The straggling

little mining camp, its population divided between

American, French-Canadians of uncertain pedigree,

and Indians with an occasional admixture of canny

Scotchmen, whose conversation savored strongly of

the old Hudson Bay Trading Company's days in the far north, enjoyed no reputation outside of Forty Mile, Juneau and the Puget Sound cities of Seattle and Tacoma. From the wharves of these cities in 1895 there left at infrequent intervals, small chuggy, wobbly steamers for Southeastern Alaska points usually carrying in the spring months motley cargoes, of yelping dogs, rough coated, bearded, tanned miners and prospectors from all points of the globe, and great quantities of canned goods of every description.

In those days the eager and hardy prospector who fared forth to the Yukon's dangers in search of gold was usually indifferent to whatever fate befell him. He figured that at best the odds were over whelmingly against him, with just one chance, or maybe ten, in a hundred of striking a pay streak. It was inevitable that a great proportion of the venturous and ignorant Chechacos, or newcomers, who paid their dollars by the hundred to the steamship companies in Seattle, should, after failing in the search for gold, seek means of gaining a miserable existence in some wage paid vocation.

Were it in my power to bring my hero on the stage under more auspicious circumstances than those of which I am about to tell, I would gladly do it. But the truth must be told of Swiftwater Bill, and at the time of the opening of my narrative —and this was before the world had ever heard the least hint of the wonderful Klondike gold discovery —Swiftwater stood washing dishes in the kitchen of the road-house I have just described.

The place was no different from any one of a thousand of these little log shelters where men, traveling back and forth in the dead of winter with dog teams, find temporary lodging and a hurried meal of bacon and beans and canned stuff. It was broad daylight, although the clock showed eleven P. M., in August, 1896. The sun scarcely seemed to linger more than an hour beneath the horizon at nightfall, to re-appear a shimmering ball of light at three o'clock in the morning.

"Bring us another pot of coffee!' shouted one of three prospectors, who sat with their elbows on the table, greedily licking up the remnants of a huge platter full of bacon and beans garnished with some strips of cold, canned roast beef and some

evaporated potatoes, which had been made into a kind of stew.

The hero of my sketch wiped his hands on a greasy towel and, taking a dirty, black tin coffee pot from the top of the Yukon stove, he hurried in to serve his customers.

One of these was six feet two, broad shouldered, sparsely built, hatchet faced, with a long nose, keen blue eyes and with auburn colored hair falling almost to his shoulders. French Joe was the name he went by, and no more intrepid trapper and prospector ever lived in the frozen valley of the Yukon than he. The other two were nondescripts— one with a coarse yellow jumper, the other in a dark blue suit of cast off army clothes. The man in the jumper was bearded, short and chunky, of German extraction, while the other was a half-blood Indian.

Swiftwater, as he ambled into the room, one hand holding his dirty apron, the other holding the coffee pot, was not such a man as to excite the interest of even a wayfarer in the road-house at Circle. About 35 years old, five feet five inches tall, a scraggly growth of black whiskers on his chin, and long, wavy moustaches of the same color, curling from his upper lip, Swiftwater did not arouse even a passingglance from the trio at the table.

"Boys, de' done struck it, al' right, 'cause Indian George say it's all gold from ze gras' roots, on Bonanza. An' it's only a leetle more'n two days polin' up ze river from ze T'hoandike."

It was French Joe who spoke, and then when he drew forth a little bottle containing a few ounces of gold nuggets and dust, Swiftwater Bill, as he poured the third cup of coffee, gazed open mouthed on the showing of yellow treasure.

It is only necessary to say that from that moment Swiftwater was attentive to the needs of his three guests, and when he had overheard all of their talk he silently, but none the less positively, made up his mind to quit his job forthwith and to "mush" for the new gold fields.

And this is why it was that, the next morning, the little Circle Citv road-house was minus a dishwasher and all round handyman. And before the little community was well astir, far in the distance, up the Yukon river, might have been seen the little, dark

bearded man poling for dear life in a flat-bottom boat, whose prow was pointed in the direction of the Klondike river.

Chatper 2

WOULD be useless to encumber my story with a lengthy and detailed narrative of Swiftwater Bill's experiences in the first mad rush of goldseekers up the narrow and devious channels of Bonanza and Eldorado Creeks. The world has for eleven years known the entrancing story of George Carmack's find on Bonanza—how, from the first spadeful of grass roots, studded with gold dust and nuggets, which filled a tiny vial, the gravel beds of Bonanza and Eldorado and a few adjoining creeks, all situated within the area of a township or two, produced the marvelous sum of $50,000,000 within a few years.

Swiftwater struck gold from the very first. He located No. 13 Eldorado, and had as his neighbors such well known mining men as Prof. T. S. Lippy, the Seattle millionaire, who left a poorly paid job as physical director of the Y. M. C. A. in Seattle to prospect for gold in Alaska ; Ole Oleson ; the Berry Bros., who cleaned up a million dollars on two and a fraction claims on Eldorado ; Antone Stander ; Michael Dore, a young French-Canadian, who died from exposure in a little cabin surrounded by tin oil cans filled to overflowing with the yellow metal, and others equally well known.

Swiftwater 's ground on No. 13 Eldorado was fabulously rich— so rich that after he had struck the pay streak, the excitement was too much for him and he forthwith struck out for the trail that leads to Dawson. And now I am about to reveal to Alaskans and others who read this little book a quality about Swiftwater of which few people had any knowledge whatever, and this shows in a startling way how easy it was in those halcyon days in the Golden Klondike for a man to grasp a fortune of a million dollars in an instant and then throw it away with the ease and indifference that a smoker discards a half-burned cigar.

Swiftwater, as may well be imagined, when he struck the rich layers of gold in the candle-lit crevices

struck the richest layers of gold in the candle-lit crevices of bedrock on Eldorado a few feet below the surface, could have had a half interest in a half dozen claims on each side of him if he had simply kept his mouth shut and informed those he knew in Dawson of the strike, on condition that they would share half and half with him. This was a common transaction in those days and a perfectly legitimate one, and Swiftwater could have cleaned up that winter beyond question $1,000,000 in gold dust, after paying all expenses and doing very little work himself, had he exercised the most common, ordinary business ability.

Instead, Swiftwater, when he struck Dawson, threw down a big poke of gold on the bar of a saloon and announced his intention of buying out the finest gambling hall and bar in town. Dawson was then the roughest kind of a frontier mining camp, although the mounted police preserved very good order. There were at least a score of gambling halls in Dawson and as many more dance halls. The gambling games ran continually twenty-four hours a day, and the smallest wager usually made, even in the poorest games, was an ounce of gold, or almost $20.

When Bill laid down his poke of gold on the bar of a Dawson saloon—it was so heavy he could hardly lift it—he was instantly surrounded bv a mob of thirty or forty men and a few women.

"Why, boys!" said Swiftwater, ordering a case of wine for the thirsty, while he chose appolinaris himself, "that's easy enough! All you've got to do is to go up to Eldorado Creek and you can get all the gold you want by simply working a rocker about a week."

That settled the fate of Eldorado, for the next day before three o'clock in the morning there was a stampede to the new find, and in twenty-four hours the whole creek had been staked from mouth to source.

Comfortably enjoying the knowledge that he had $300,000 or $400,000 in gold to the good, Swiftwater set about finding ways to spend it.

His first order "to the outside' was for a black Prince Albert coat and a black silk top hat, which came in in about five or six weeks and were immediately donned by Swiftwater. By this time

immediately donned by Swiftwater. By this time he had become the owner of the Monte Carlo, the biggest gambling hall in Dawson.

"Tear the roof off, boys!" Swiftwater said when the players on the opening night swarmed in and asked what was the limit of the bets.

"The sky is the limit and raise her up as far as you want to go, boys," said Swiftwater, "and if the roof's in your way, tear it off!"

Just about this time came the first of Swiftwater 's affaires d' l'amour, because a day or two previously five young women of the Juneau dance halls had floated down the river in a barge and gone to work in Dawson. There were two sisters in the group. Both of them were beautiful women, young, bright entertaining and clever in the way such women are. They were Gussie and May Lamore.

"I am going to have a lady and the swellest that's in the country," Swiftwater told his friends, and then, donning his best clothes, the costliest he could buy in Dawson, Swiftwater went over to the dance hall, where the Lamore sisters were working, and ordered wine for everybody on the floor.

Gussie was dancing with a big, brawny, French-Canadian miner. Her little feet seemed scarcely to touch the floor of the dance hall as the miner whirled her around and around. She was little, plump, beautifully formed and with a face of more than passing comeliness.

You women of "the States"—when I say "the States" I simply speak of our country as do all the old-timers in Alaska, and not as if it was some foreign country, but as it really is to us, the home of ourselves and pur forebears, yet separated from us bv thousands of miles of iceclad mountain barriers and storm swept seas have no conception of the dance hall girl as a type of the early days of Dawson. Many of the were of good families, young, comely, and fairly well educated. What stress or storm befell them, or other inhospitable element in their lives drove them to the northern gold mining country, God knows it is not my portion to tell. Nor could any one of them probably, in telling her own life story, give the reasons for the appearance in these dance halls of any of her sisters.

It is enough for you, and me to understand— and it requires no unusual insight into the human heart and its mysteries to do so—that when a miner had spent a few months in the solitude of the hills and gold lined gulches of the Yukon Valley, if he finally found the precious gold on the rim of the bedrock, his first thought was to go back to "town." Back to toAvn? Yes, because "town" meant and still means to those hardy men any place where human beings are assembled, and the dance hall, in those rough days, was the center of social activities and gaieties.

The sight of little Gussie Lamore, with her skirt just touching the tops of her shoes, spinning around in a waltz with that big French-Canadian, set all of Bill's amorous nature aglow. He went to the hotel, filled his pockets with pokes of gold dust and came

Source : [HL006N][GDrive]

- BIRTH: 17 Dec 1886 , Minneapolis, Hennepin County, Minnesota, USA
- DEATH: 17 Jun 1933 (aged 46), Cambridge, Middlesex County, Massachusetts, USA
- BURIAL : Mount Hebron Cemetery. Montclair, Essex County, New Jersey, USA

Frederick Lamont Gates, born in Minneapolis, Hennepin County, MN, December 17, 1886, married, September 11, 1917 in Duluth, St. Louis County, MN, Dorothy Olcott, born June 20, 1891, daughter of William James and Fannie (Bailey) Olcott.

His father said he was "born for study and inquiry and disclosed this at an early age". Ill health disqualified him from athletic activities and his life was centered wholly on activities of the mind. He was accepted at Harvard, Yale and the University of Chicago and, after a year and a half at Chicago, he chose to continue his studies at Yale. He stood at the head of his class, received the Phi Beta Kappa key, and graduated Summa Cum Laude in 1909. The same year, he entered John Hopkins Medical School, and graduated with highest honors four years later. He was recommended for research work at the Rockefeller Institute and took a position on its staff.

On the declaration of war in 1917, Mr. Gates volunteered for the U.S. Army Medical Corps, was accepted and commissioned a first lieutenant. He was assigned to duty on the Rockefeller Institute staff where he gave lectures to military groups selected to attend training there. He was also assigned to visit training camps, in the interest of preventive medicine, and traveled widely. He continued at the institute after the war and his researches, especially those on influenza, received worldwide recognition. His health failed in 1927 and he was required to undertake a less demanding schedule. He continued his research at Harvard and moved his family to Cambridge, MA where he died, June 17, 1933, at age forty-six, after suffering a concussion from a fall.

He is honored in a memorial at the family plot in Mount Hebron Cemetery, Montclair, NJ. His widow, Dorothy, married, second, Leonard Elsmith, but this ended in divorce, and there were no children by her second marriage. She lived for many years in Woods Hole, Barnstable County, MA where she died, January 29, 1984.

Children of Frederick & Dorothy:

JEM FROM THE ARCHIVE

Influenza: exposing the true killer

In the early 1930s, Richard Shope isolated influenza virus from infected pigs. Shope's finding was quickly followed by the isolation of the influenza virus from humans, proving that a virus—not a bacterium, as was widely believed—caused influenza.

In 1892, German bacteriologist Richard Pfeiffer isolated what he thought was the causative agent of influenza. The culprit, according to Pfeiffer, was a small rod-shaped bacterium that he isolated from the noses of flu-infected patients (1). He dubbed it *Bacillus influenzae* (or Pfeiffer's bacillus). Few doubted the validity of this discovery, in large part because bacteria had been shown to cause other human diseases, including anthrax, cholera, and plague.

Richard Shope, 1931.

The filtration question

When history's deadliest influenza pandemic began in 1918, most scientists believed that Pfeiffer's bacillus caused influenza. With the lethality of this outbreak (which killed an estimated 20 to 100 million worldwide) came urgency—researchers around the world began to search for Pfeiffer's bacillus in patients, hoping to develop antisera and vaccines that would protect against infection. In many patients, but not all, the bacteria were found. Failures to isolate B. influenzae (now known as *Haemophilus influenzae*) were largely chalked up to inadequate technique, as the bacteria were notoriously difficult to culture (2).

The first potential blow to Pfeiffer's theory came from Peter Olitsky and Frederick Gates at The Rockefeller Institute. Olitsky and Gates took nasal secretions from patients infected with the 1918 flu and passed them through Berkefeld filters, which exclude bacteria. The infectious agent—which caused lung disease in rabbits—passed through the filter, suggesting that it was not a bacterium (3, 4). Although the duo had perhaps isolated the influenza virus (which they nevertheless referred to as an atypical bacterium called *Bacterium pneumosintes*), other researchers could not reproduce their results. One of the doubters was Oswald Avery (Rockefeller Institute), who developed a culture media—chocolate agar—that optimized the growing conditions for B. influenzae and thus minimized false negative results from patient samples. Thus, the idea that flu was transmitted by a filterable agent (or virus) was dismissed.

Insights from pigs

Olitsky and Gates would not be vindicated until a decade later, when Shope—a young physician from Iowa then working on hog cholera at the Rockefeller Institute—turned his attention to swine influenza.

Pig farmers in Iowa had reported two outbreaks—one in 1918 and another in 1929—of a highly contagious, influenza-like disease among their animals. The disease bore such a remarkable resemblance to human flu that it was named swine influenza. Shope and his mentor, Paul Lewis, had reported two outbreaks—one in 1918 and another in 1929—of a highly contagious, influenza-like disease among their animals. The disease bore such a remarkable resemblance to human flu that it was named swine influenza. Shope and his mentor, Paul Lewis, took mucus and lung samples from the infected pigs and attempted to isolate the disease-causing agent. They quickly isolated a bacterium that looked exactly like Pfeiffer's human bacterium (and was thus called *B. influenzae suis*), but when they injected the bacteria into pigs, it caused no disease (5).

Shope then filtered the samples and, like Olitsky and Gates, found that the filtrate contained the infectious agent. Shope's filtrate caused a highly contagious, influenza-like disease in pigs—albeit a more mild one than seen in naturally-infected pigs. Mixing the filtrate with the bacterium reproduced the severe disease. He concluded—correctly—that the filterable agent caused the infection, which then facilitated secondary infection with the bacterium (6). Shope published his results in a series of papers in *The Journal of Experimental Medicine* (5, 6).

Using Shope's technique, Wilson Smith, Christopher Andrewes, and Patrick Laidlaw (National Institute for Medical Research, UK) soon isolated the virus from humans (7), laying to rest any lingering doubts about the nature of the flu-inducing agent.

Both Shope and the British trio later demonstrated that sera from humans that were infected with the 1918 flu virus could neutralize the pig virus, leading them to conclude that the swine virus was a surviving form of the 1918 human pandemic virus (8, 9). In fact, a related strain of flu still circulates among pigs today.

Abstract

In the early 1930s, [Dr. Richard Edwin Shope (born 1901)] isolated influenza virus from infected pigs. Shope's finding was quickly followed by the isolation of the influenza virus from humans, proving that a virus—not a bacterium, as was widely believed—caused influenza.

In 1892, German bacteriologist Richard Pfeiffer [https://en.wikipedia.org/wiki/Richard_Friedrich_Johannes_Pfeiffer] isolated what he thought was the causative agent of influenza. The culprit, according to Pfeiffer, was a small rod-shaped bacterium that he isolated from the noses of flu-infected patients. He dubbed it Bacillus influenzae (or Pfeiffer's bacillus). Few doubted the validity of this discovery, in large part because bacteria had been shown to cause other human diseases, including anthrax, cholera, and plague.

The filtration question

When history's deadliest influenza pandemic began in 1918, most scientists believed that Pfeiffer's bacillus caused influenza. With the lethality of this outbreak (which killed an estimated 20 to 100 million worldwide) came urgency—researchers around the world began to search for Pfeiffer's bacillus in patients, hoping to develop antisera and vaccines that would protect against infection. In many patients, but not all, the bacteria were found. Failures to isolate B. influenzae (now known as Haemophilus influenzae) were largely chalked up to inadequate technique, as the bacteria were notoriously difficult to culture.

The first potential blow to Pfeiffer's theory came from Peter Olitsky and Frederick Gates at The Rockefeller Institute. Olitsky and Gates took nasal secretions from patients infected with the 1918 flu and passed them through Berkefeld filters, which exclude bacteria. The infectious agent—which caused lung disease in rabbits—passed through the filter, suggesting that it was not a bacterium . Although the duo had perhaps isolated the influenza virus (which they nevertheless referred to as an atypical bacterium called Bacterium pneumosintes), other researchers could not reproduce their results. One of the doubters was Oswald Avery (Rockefeller Institute) [https://en.wikipedia.org/wiki/Oswald_Avery], who developed a culture media—chocolate agar—that optimized the growing conditions for B. influenzae and thus minimized false negative results from patient samples. Thus, the idea that flu was transmitted by a filterable agent (or virus) was dismissed.

Insights from pigs

Olitsky and Gates would not be vindicated until a decade later, when [Dr. Richard Edwin Shope (born 1901)]—a young physician from Iowa then working on hog cholera at the Rockefeller Institute—turned his attention to swine influenza.

Pig farmers in Iowa had reported two outbreaks—one in 1918 and another in 1929—of a highly contagious, influenza-like disease among their animals. The disease bore such a remarkable resemblance to human flu that it was named swine influenza. [Dr. Richard Edwin Shope (born 1901)] and his mentor [Dr. Paul Adin Lewis (born 1879)] took mucus and lung samples from the infected pigs and attempted to isolate the disease-causing agent. They quickly isolated a bacterium that looked exactly like Pfeiffer's human bacterium (and was thus called B. influenzae suis), but when they injected the bacteria into pigs, it caused no disease.

Shope then filtered the samples and, like Olitsky and Gates, found that the filtrate contained the infectious agent. [Dr. Richard Edwin Shope (born 1901)]**'s filtrate caused a highly contagious, influenza-like disease in pigs—albeit a more mild one than seen in naturally-infected pigs.** Mixing the filtrate with the bacterium reproduced the severe disease. **He concluded—correctly—that the filterable agent caused the infection, which then facilitated secondary infection with the bacterium** (6). Shope published his results in a series of papers in The Journal of Experimental Medicine .

Using Shope's technique, Wilson Smith, Christopher Andrewes, and Patrick Laidlaw (National Institute for Medical Research, UK) soon isolated the virus from humans (7), laying to rest any lingering doubts about the nature of the flu-inducing agent.

Both [Dr. Richard Edwin Shope (born 1901)] and the British trio later demonstrated that sera from humans that were infected with the 1918 flu virus could neutralize the pig virus, leading them to conclude that the swine virus was a surviving form of the 1918 human pandemic virus. In fact, a related strain of flu still circulates among pigs today.

INFLUENZA VACCINE.

Killed Cultures of Germ Are Used On Men of the Army Medical School.

A vaccine for combating influenza has been developed and tested on human subjects, an article published in the science magazine, Science, reveals. Killed cultures of the newly announced influenza germ, bactehium pneumosintes, are used. All is ready for quantity production of the vaccine if another severe epidemic should require its widespread use.

The article, by Drs. Peter K. Olitsky and Frederick L. Gates of the Rockefeller Institute for Medical Research, will tell how the mild influenza epidemic of about a year ago gave these scientists new strains of the minute and remarkable influenza germ, which they discovered about two years ago. This new supply of germs resulted in such decisive experiments on rabbits that human experimentation was undertaken.

Officers and men at the Army Medical school in Washington volunteered to submit to vaccination with killed cultures of bacterium pneumosintes, so named because when alive it injures the lungs. Each subject was given three shots of the dead germs under his skin in a manner similar to that employed with antityphoid vaccine. The immediate reaction and inconvenience was even milder than that experienced after antityphoid vaccination. But ten days after the final injection, the blood of seven out of nine men examined contained substances called agglutinins, which attacked and rendered harmless the influenza germs that were brought into contact with them. This showed that immunity to the disease germs had been established through the vaccination.

As a result of these first human tests, the vaccine is being offered to much larger groups of men in the United States army, the article says.

"It is not possible, of course, to determine the protective effects of these injections directly," the scientists report. "In the event of a recurrence of epidemic influenza in the near future, however, the efficacy of vaccination with bacterium pneumosintes as a preventive masure may be put to test."

Without waiting for this final judgment, methods have been developed so that large amounts of the influenza vaccine can be quickly produced if its widespread use should be needed in combating a severe epidemic.

Dr. Olitsky and Gates report experiments that show that persons who have recovered from flu have protective substances in their blood similar to those produced by vaccination with the influenza germs. This would indicate that having the flu once will protect against a second attack for some time, just as one attack of smallpox is as effective as a vaccination.

But larger tests of medical progress are opened by the revelations in the article. Drs. Olitsky and Gates declare that we are at the threshold of knowledge of a group of minute microorganisms, of which the influenza germ is just the first. Bacterium pneumosintes is not the only microorganism found in the respiratory tract that flourishes without free oxygen and passes through the pores of the finest porcelain filters. The Rockefeller scientists have found and cultivated other filterable organisms, which do not cause disease in rabbits. They state:

"They indicate, however, that the cultural methods recently employed in these studies may lead to the isolation of a group or groups of hitherto undescribed bacterial inhabitants of the upper respiratory tract and so they point to interesting opportunities in this field of bacteriology."

[HN01KL][GDrive]

1923 (March) - Time Magazine : "Medicine: No Armistice Yet"

Source : [HP0058][GDrive]

"The recent announcement of the discovery of the influenza germ at the Rockefeller Institute for Medical Research, broadcasted by radio from the New York State Department of Health and given wide newspaper publicity, has on second thought, like so many other much-heralded scientific events, turned out to be less exciting than was at first supposed. The Journal of the American Medical Association, official organ of the medical profession in the United States, carries an editorial stating the residue of facts in the case, on the authority of Dr. Simon Flexner, director of the Institute.

*The " discovery" is simply the summarizing of scientific papers published during the past three years by **Drs. Frederick L. Gates** and **Peter K. Olitsky**, of the Institute staff. A new microorganism, bacterium pneumosintes, has been isolated from the noses and throats of several patients with influenza, has been independently cultivated, and has produced influenza-like symptoms when injected into rabbits. Numerous other varieties of bacteria, such as Pfeiffer's bacillus, are usually present in these puzzling respiratory diseases, and it is not clear that the new organism is the invariable causal agent of influenza, though it is believed that it produces conditions in the lung tissues which facilitate the onset of pneumonia and other complications. No specific vaccine, or serum has yet been devised to combat the bacterium, nor has the work been confirmed by other observers. We are still a long way, therefore, from scientific control of epidemic influenza."*

PREFACE

DURING the summer of 1922, nineteen men coöperated in presenting a course of lectures in Teachers College, Columbia University. The purpose of the course was primarily to provide interesting and engaging information about the achievements of modern science. It attempted to give students of all subjects an understanding of certain types of achievements of modern science, to suggest the meaning of science in various aspects of modern life and thought; to indicate the place of science in modern, social, and industrial relations. Before half of the lectures had been presented, hundreds of listeners had requested me, as organizer of the course, to assemble and publish part of the lectures and if possible, to find means for wide distribution of the resulting volume. In my desire that the volume, when published, might benefit from the unusual style and scientific clarity of Dr. E. E. Slosson, his assistance was successfully importuned in the venture. Then, a gracious and generous though anonymous benefactor agreed to finance the placement of a limited number of copies of the proposed volume in libraries of educational institutions. Finally, the publishers coöperated by providing at bare cost of production the first lot of copies for general distribution, depending upon later sales for their profits from the publication. The authors and the

[HB0063][GDrive]

editors have contributed their services without personal remuneration, and have done this as a welcome privilege in helping to extend the achievements and underlying truths of this most conspicuous field of modern thought. Not all the lectures which were given in the course are available; also changes which are advisable for publication have been made; and Dr. Kellogg and Dr. Williams have kindly added chapters upon topics of wide interest and importance.

Why give such a course of lectures, and why publish such a volume? Because the citizen of our day uses modern science at each turn of his day's work. If he is a thinking citizen, he is ambitious to benefit by what he understands as scientific procedure in using facts, principles, and occurrences. A manufacturer wants his operators to possess whatever knowledge of materials and processes science has produced for the improvement of quality and quantity of output. A lawyer or preacher desires factual illustrative material from the working world of science with which to make his case clear and convincing. If this citizen is a teacher of any subject or grade he deals with the biggest science need of all, for those whom he teaches belong to an age which science has made unlike any of its predecesssors. To men in industry, commerce, and the professions, it is of increasing importance that progressive workers shall have knowledge not only of accomplishments of science, but of the methods by which discoveries are made.

Some thirty years ago Louis Pasteur said:

In our century science is the soul of the prosperity of nations and the living source of all progress. Undoubtedly, the tiring daily

AN INVESTIGATION ON EPIDEMIC INFLUENZA

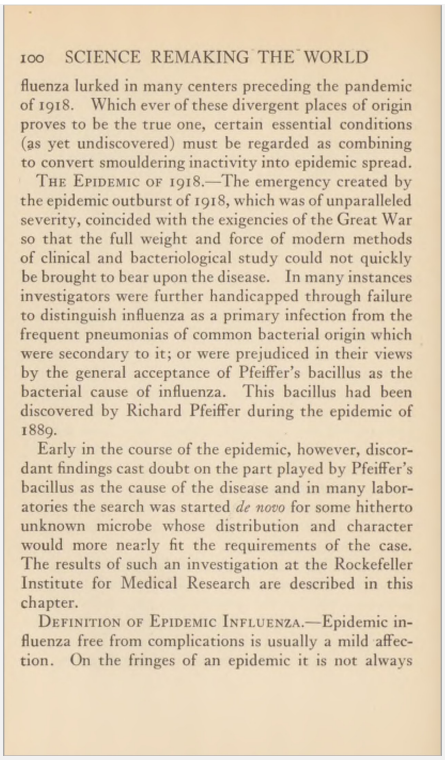
By Peter K. Olitsky, M.D. and Frederick L. Gates, M.D.
The Rockefeller Institute for Medical Research

EPIDEMICS of influenza have occurred at intervals for centuries, and may be recognized from contemporary descriptions though they were known under different names in different places and different times. The disease has had a wide or more restricted distribution according to various circumstances of the time, especially the rapidity and extent of the movements of men. Thus in earlier centuries human transport carried the pestilence slowly and over limited areas; in modern times, in a world knit closely together with frequent and rapid means of migration, the disease passes quickly from country to country and from continent to continent. During the World War it quickly exacted a death toll from the warring countries surpassing their losses under arms.

The place or places of origin of the epidemics are still under investigation, and it remains for future study to determine whether the spread takes place from a single source or from many. History traces the outbreaks of many epidemics to regions of eastern Russia and Turkestan; but indications are not wanting that in-

99

Page 99 : [HB0067][GDrive]



100 SCIENCE REMAKING THE WORLD

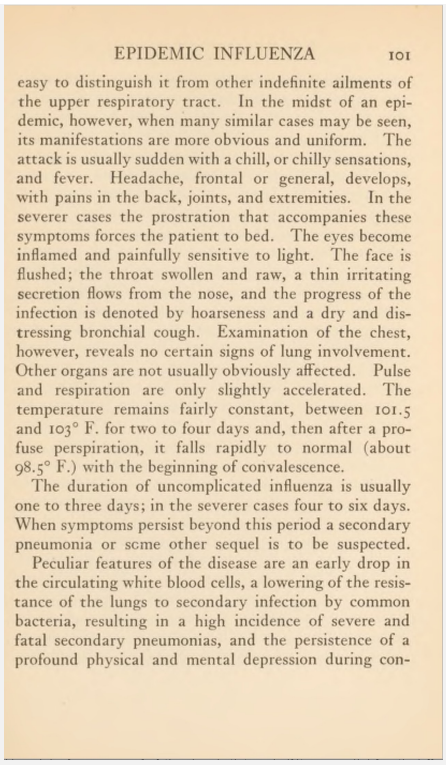
fluenza lurked in many centers preceding the pandemic of 1918. Which ever of these divergent places of origin proves to be the true one, certain essential conditions (as yet undiscovered) must be regarded as combining to convert smouldering inactivity into epidemic spread.

The Epidemic of 1918.—The emergency created by the epidemic outburst of 1918, which was of unparalleled severity, coincided with the exigencies of the Great War so that the full weight and force of modern methods of clinical and bacteriological study could not quickly be brought to bear upon the disease. In many instances investigators were further handicapped through failure to distinguish influenza as a primary infection from the frequent pneumonias of common bacterial origin which were secondary to it; or were prejudiced in their views by the general acceptance of Pfeiffer's bacillus as the bacterial cause of influenza. This bacillus had been discovered by Richard Pfeiffer during the epidemic of 1889.

Early in the course of the epidemic, however, discordant findings cast doubt on the part played by Pfeiffer's bacillus as the cause of the disease and in many laboratories the search was started *de novo* for some hitherto unknown microbe whose distribution and character would more nearly fit the requirements of the case. The results of such an investigation at the Rockefeller Institute for Medical Research are described in this chapter.

Definition of Epidemic Influenza.—Epidemic influenza free from complications is usually a mild affection. On the fringes of an epidemic it is not always

Page 100 : [HB0068][GDrive]



EPIDEMIC INFLUENZA 101

easy to distinguish it from other indefinite ailments of the upper respiratory tract. In the midst of an epidemic, however, when many similar cases may be seen, its manifestations are more obvious and uniform. The attack is usually sudden with a chill, or chilly sensations, and fever. Headache, frontal or general, develops, with pains in the back, joints, and extremities. In the severer cases the prostration that accompanies these symptoms forces the patient to bed. The eyes become inflamed and painfully sensitive to light. The face is flushed; the throat swollen and raw, a thin irritating secretion flows from the nose, and the progress of the infection is denoted by hoarseness and a dry and distressing bronchial cough. Examination of the chest, however, reveals no certain signs of lung involvement. Other organs are not usually obviously affected. Pulse and respiration are only slightly accelerated. The temperature remains fairly constant, between 101.5 and 103° F. for two to four days and, then after a profuse perspiration, it falls rapidly to normal (about 98.5° F.) with the beginning of convalescence.

The duration of uncomplicated influenza is usually one to three days; in the severer cases four to six days. When symptoms persist beyond this period a secondary pneumonia or some other sequel is to be suspected.

Peculiar features of the disease are an early drop in the circulating white blood cells, a lowering of the resistance of the lungs to secondary infection by common bacteria, resulting in a high incidence of severe and fatal secondary pneumonias, and the persistence of a profound physical and mental depression during con-

Page 101 : [HB0069][GDrive]

Notes : Gates make mention of https://en.wikipedia.org/wiki/Hideyo_Noguchi , who died in May 1928 . Similar to the death of **Dr. Paul Adin Lewis (born 1879)** in 1929.

"Artificial Cultivation.—From the beginning of the investigation, while the first animal transmission experiments were in progress, attempts were made to isolate the active agent in artificial cultures outside the body. For this purpose the usual methods of cultivation were discarded in favour of the particular methods developed by ***Doctor Noguchi****, based on the early experiments of Doctor Theobald Smith.* ***The Smith-Noguchi culture medium****, which had proved successful in the cultivation of certain highly parasitic microbes, consists of dilute blood serum or tissue fluid with a small fragment of fresh sterile tissue—usually rabbit kidney—and is thus very different from the artificial broths and jellies commonly employed in bacteriology. Besides furnishing nutritive substances the tissue fragment creates an environment favourable to those peculiar "anaerobic" microorganisms which can live only in the absence of air. The choice of this medium for the cultivation of the active agent of the animal transmission experiments proved to be a fortunate one."*

HARVARD PROF FOUND WITH MYSTERY WOUNDS

Boston, June 15.—A gaping wound in his head and his face bruised, Dr. Frederick L. Gates, instructor in general physiology at Harvard, was found unconscious on the floor of a deserted university laboratory tonight. While police sought to penetrate the mystery of his plight, he was rushed to Cambridge City Hospital where his name was placed on the danger list.

FOUND BADLY HURT IN HARVARD LABORATORY

Dr Gates Stricken While Doing Research Work

Unconscious and with a wound on his head that required four stitches, Dr Frederick L. Gates, 48, instructor in General Physiology at Harvard University was found at 7:40 o'clock last night lying on the cement floor of the Biological Laboratory on Divinity av, Cambridge. He had been there sometime, apparently.

It is believed he had a fainting spell, toppled over and struck his head against a table. He wore a laboratory coat, and had been engaged in research work.

Dr Gates was found by two graduate students, Paul R. Burkholder, 104 Hammond st, Cambridge, and Harold H. Perlenfein, 40 Upland road, Belmont, who called the Cambridge police.

Dr Gates was taken in an ambulance to the Cambridge City Hospital, where the wound in his head was sewed. Over one eye, Dr Gates had a bad bruise and the hospital doctors say he may have a fracture of the skull. He lives at 31 Fayerweather st, Cambridge. Police were told his wife was at the Gates' Summer home at Woods Hole, but later she was located by State Police at Northampton, where she was attending her Smith College class reunion. She is on her way back to Cambridge.

Dr Gates was unconscious late last night and his name was on the danger list. His condition is considered serious.

Associates of Dr Gates said late last night that he has been subject to attacks of a similar nature. He has been working hard lately and, when he was overcome, was making blood tests. The Harvard authorities have been in constant touch with the hospital doctors and have offered to assist in any way possible in the treatment of Dr Gates.

Dr Gates has five children.

DR FREDERICK L. GATES MUCH BETTER

Harvard Instructor Found Hurt in Laboratory

The condition of Dr Frederick L. Gates, 48, instructor in general physiology at Harvard University, found unconscious at 7:40 last night on the cement floor of the Biological Laboratory on Divinity av, Cambridge, was reported as much improved this morning at the Stillman Infirmary of Harvard University. Dr Gates was transferred to the infirmary late last night from the Cambridge City Hospital where he was first rushed, and where four stitches were taken for a wound on his head.

His name is not on the danger list at the infirmary. His condition was considered serious when he was first admitted to the Cambridge Hospital.

It is believed he had a fainting spell, toppled over and struck his head against a table. He wore a laboratory coat, and had been engaged in research work.

Dr Gates was found by two graduate students, Paul R. Burkholder, 104 Hammond st, Cambridge, and Harold H. Perlenfein, 40 Upland road, Belmont, who called the Cambridge police.

The Montclair Times

Every Tuesday & Friday — MONTCLAIR, N. J., TUESDAY MORNING, JUNE 20, 1933 — 12 PA

DR. F. L. GATES DIES AS RESULT OF ACCIDENT

Son of Mrs. F. T. Gates Succumbs at Boston Hospital.

Dr. Frederick Lamont Gates, eldest son of Mrs.. Frederick Taylor Gates of 66 South Mountain avenue, and the late Mr. Gates, died Saturday night at the Boston City Hospital from a skull fracture received last Thursday, when he fainted and fell to the floor, while working in his labratory in the new Biological Building at Harvard.

Dr. Gates, lecturer on general physiology at the Harvard Medical School and a prominent medical research expert, was born in Minneapolis, Minn., in 1887, but moved to Montclair when he was five years old, and resided here for many years. He attended the Montclair public schools and was graduated from the Montclair High School in 1905. His brothers and sisters are Franklin H. Gates, Russel C. Gates, Percival T. Gates, Mrs. William K. Pudney and Mrs. Leverett H. Hooper, all of Montclair, and Mrs. Morris P. Mitchell of Buffalo.

Dr. Gates was graduated from Yale

(Continued on Page Eight)

NOTED PHYSICIAN DIES IN BOSTON

(Continued from Page One)

in 1909 and from John Hopkins Medical School four years later. He had been engaged entirely in research work since his graduation from the latter institution. For the first fiteen years after leaving John Hopkins he was engaged in general medical research work at the Rockefeller Institute in New York. He moved to Cambridge five years ago to join the staff of the Harvard Medical School, where he had been occupied with research and lecturing. He had been a frequent contributor to the Journal of Medical Research and other medical publications.

He leaves his widow, Mrs. Dorothy Olcott Gates and five children, Olcott, Barbara, Frederick Taylor, Dorothy and Deborah.

A memorial service will be held at his summer home at Woods Hole, Mass., next Monday.

1934-1936 - Braman family buy lot in Bremerton next to W.H. Gates I residence and build custom mansion

Braman family : James d'Orma Braman (born 1901) / Source : [HN00YW][GDrive]

Mr. Gates Sr. [, son of William Henry Gates I ,] early on built a life outside of his home. Next door, the Braman family had two boys for him to play with and a father who would become his most important role model [for William Henry Gates II].

That man, Dorm Braman, had built his business and would later become a Naval officer, mayor of Seattle and a U.S. assistant secretary of transportation. In the late 1930s, Mr. Braman brought Bill Sr. on family road trips across the country. He was scoutmaster of Bill Sr.'s Boy Scout troop, leading the boys on hikes through the Olympic Mountains and driving them in a beat-up bus to Yellowstone and Glacier National Parks. The troop spent two years building a log house from Douglas firs they felled themselves. Mr. Braman had "no sense of personal limitations whatsoever," says Mr. Gates Sr.

1937/1938 - William Henry Gates is the treasurer of the Bremerton Chamber of Commerce - Signs incorporation papers for the Bremerton Chamber of Commerce

HistoryLink.org article: Source : [HW0033][GDrive]

Heading for Depression

With peace went the booming prosperity of the second decade of the twentieth century, and Bremerton settled into a period of slower growth. Employment at the base tapered off from the wartime high of 6,500 to bottom out at fewer than 2,500 by 1927, but the town itself had grown to a point that many businesses could survive by serving the area's civilian population and the lessened needs of the military. Homes were being built, car dealerships opened, services expanded, and optimism prevailed.

Bremerton absorbed the next-door community of Charleston in 1927, further increasing its population and tax base. In 1928, construction began on the light cruiser USS Louisville, and employment at the naval yard jumped by 1,000, providing additional flotation to the local economy. In June 1929, just four months before the stock market crash and the beginning of the Great Depression, Bremerton voters passed an $835,000 bond issue to improve the city's water system and to build an electrical plant.

In November, after the bottom fell out of the world economy, work began on a bridge linking Bremerton with the former Manette, now East Bremerton, financed almost entirely by public subscription. When the full effects of the Depression set in, Bremerton, perhaps inured to some degree by the previous economic ups and downs of the naval yard, actually managed better than most towns and cities.

Surviving the Thirties

The Manette Bridge opened to great fanfare in June 1930, and with that completed the people of Bremerton tackled the Great Depression. A Puget Sound Navy Yard Stabilization Bureau was established to lobby in Washington D.C., for shipyard work, and each worker at the yard pledged $5 a year to support its efforts. They also agreed to regular payroll deductions to help support Kitsap County's unemployed, and all employed workers in the county were asked to give up one day's pay a month for the same purpose.

The federal government did its part too, and the shipyard actually expanded during the Depression years. Concerns over Japan's actions in the Pacific led to orders for several new ships. County projects funded by the Works Progress Administration also helped. So successful were these combined efforts that Bremerton experienced record growth in 1934 and 1935, and by the end of the decade its population had increased by half, to over 15,000. By 1940, when the national unemployment rate was still well over 14 percent of the labor force, Bremerton's stood at just 6.9 percent. Bremerton was doing well, and in 1937 its incorporated status was upgraded to city of the second class.

Business was good enough that the Bremerton Chamber of Commerce, which had been in existence since 1907, saw fit to formally incorporate in March 1938. The incorporation papers were signed by its treasurer, William H. Gates Sr., grandfather of Microsoft co-founder Bill Gates. And during the late 1930s and early 1940s, Bremerton was also home to the controversial founder of the Church of Scientology, L. Ron Hubbard.

REGISTRAR'S REPORT

DESCRIPTION OF REGISTRANT

RACE		HEIGHT (Approx.)		WEIGHT (Approx.)		COMPLEXION	
White	X	5'10"		185		Sallow	
		EYES		HAIR		Light	
Negro		Blue		Blonde		Ruddy	X
		Gray		Red		Dark	
Oriental		Hazel	X	Brown		Freckled	
		Brown		Black		Light brown	
Indian		Black		Gray	X	Dark brown	
				Bald		Black	
Filipino							

Other obvious physical characteristics that will aid in identification: mold on left temple scar 4th finger right hand

I certify that my answers are true; that the person registered has read or has had read to him his own answers; that I have witnessed his signature or mark and that all of his answers of which I have knowledge are true, except as follows:

Irene McLellan (Signature of registrar)

Registrar for Local Board 1 Bremerton,Wash. (Number) (City or county) (State)

Date of registration April 26,1942

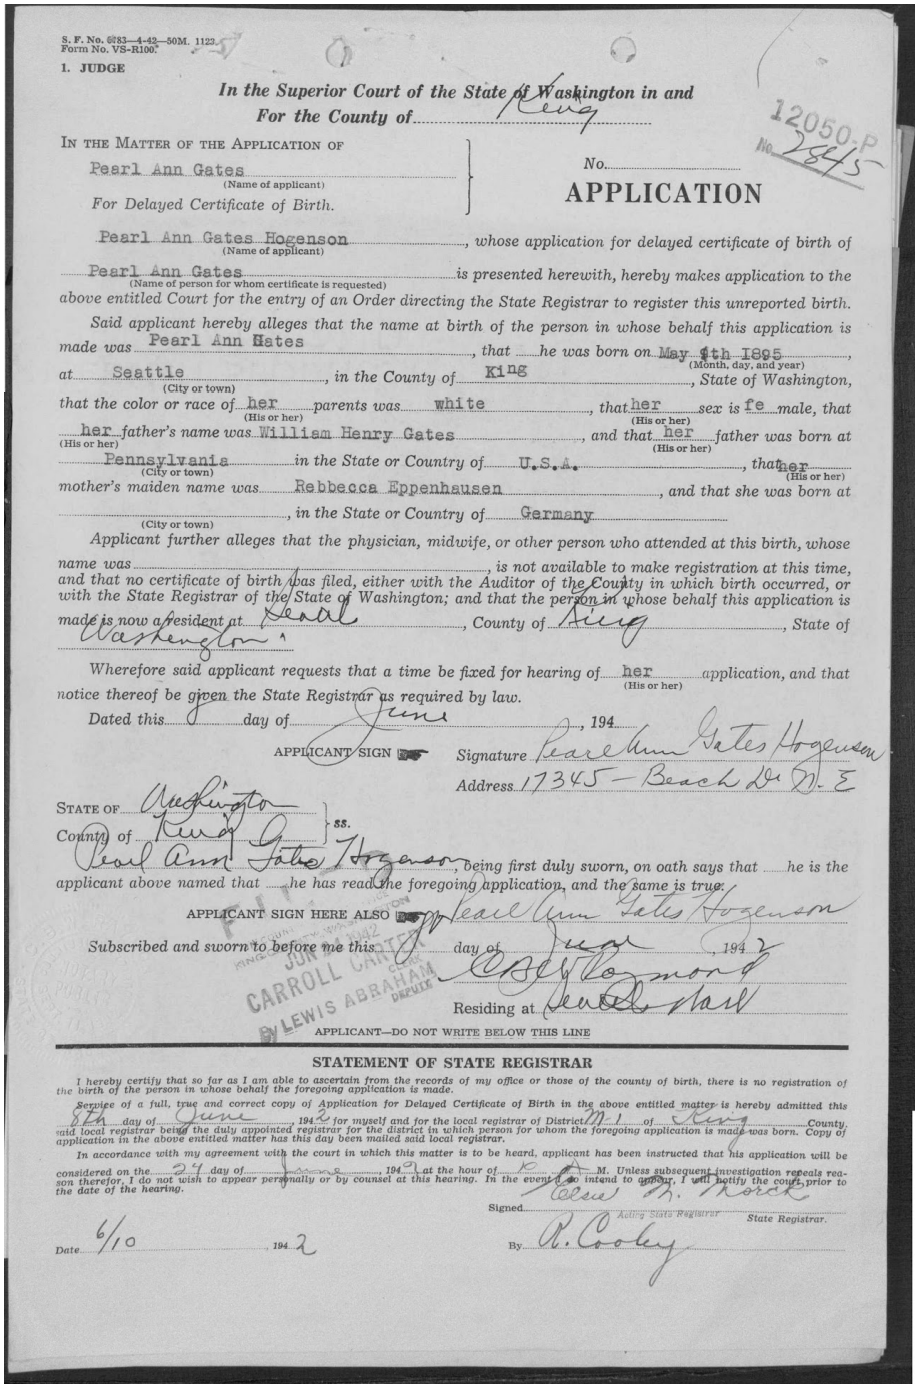
Bremerton City Local Board
650 - 4th St
Bremerton, Washington
(STAMP OF LOCAL BOARD)

(The stamp of the Local Board having jurisdiction of the registrant shall be placed in the above space)

16—21630-1

1942 (June 5) - Sister Pearl Gate's birth record is now updated ..

Application shown below



S. F. No. 5783—4-42—50M. 1122.
Form No. VS-R100.

1. JUDGE

In the Superior Court of the State of Washington in and For the County of King

12050.P
No. 2845

IN THE MATTER OF THE APPLICATION OF
Pearl Ann Gates (Name of applicant)
For Delayed Certificate of Birth.

No.

APPLICATION

Pearl Ann Gates Hogenson (Name of applicant), whose application for delayed certificate of birth of Pearl Ann Gates (Name of person for whom certificate is requested) is presented herewith, hereby makes application to the above entitled Court for the entry of an Order directing the State Registrar to register this unreported birth.

Said applicant hereby alleges that the name at birth of the person in whose behalf this application is made was Pearl Ann Gates, that he was born on May 4th 1895 (Month, day, and year), at Seattle (City or town), in the County of King, State of Washington, that the color or race of her (His or her) parents was white, that her (His or her) sex is fe male, that her (His or her) father's name was William Henry Gates, and that her (His or her) father was born at Pennsylvania (City or town) in the State or Country of U.S.A., that her (His or her) mother's maiden name was Rebbecca Eppenhausen, and that she was born at (City or town), in the State or Country of Germany.

Applicant further alleges that the physician, midwife, or other person who attended at this birth, whose name was, is not available to make registration at this time, and that no certificate of birth was filed, either with the Auditor of the County in which birth occurred, or with the State Registrar of the State of Washington; and that the person in whose behalf this application is made is now a resident at Seattle, County of King, State of Washington.

Wherefore said applicant requests that a time be fixed for hearing of her (His or her) application, and that notice thereof be given the State Registrar as required by law.

Dated this 1 day of June, 194 2

APPLICANT SIGN ☞ Signature Pearl Ann Gates Hogenson

Address 17345 — Beach Dr N. E

STATE OF Washington
County of King } ss.

Pearl Ann Gates Hogenson, being first duly sworn, on oath says that he is the applicant above named that he has read the foregoing application, and the same is true.

APPLICANT SIGN HERE ALSO ☞ Pearl Ann Gates Hogenson

Subscribed and sworn to before me this 1 day of June, 194 2

JUN 1 1942 CARROLL CANTER CLERK BY LEWIS ABRAHAM DEPUTY

Residing at Seattle Wash

APPLICANT—DO NOT WRITE BELOW THIS LINE

STATEMENT OF STATE REGISTRAR

I hereby certify that so far as I am able to ascertain from the records of my office or those of the county of birth, there is no registration of the birth of the person in whose behalf the foregoing application is made.

Service of a full, true and correct copy of Application for Delayed Certificate of Birth in the above entitled matter is hereby admitted this 6th day of June, 194 2 for myself and for the local registrar of District No. 1 of King County, said local registrar being the duly appointed registrar for the district in which person for whom the foregoing application is made was born. Copy of application in the above entitled matter has this day been mailed said local registrar.

In accordance with my agreement with the court in which this matter is to be heard, applicant has been instructed that his application will be considered on the 24 day of June, 194 2 at the hour of 10 A. M. Unless subsequent investigation reveals reason therefor, I do not wish to appear personally or by counsel at this hearing. In the event I do intend to appear, I will notify the court prior to the date of the hearing.

Signed Acting State Registrar / State Registrar.

1930s - Father WHG1 works long hours at his Furniture Store that he owned with a partner

Source : [HN00YW][GDrive]

[The] father [of William Henry Gates II, aka Bill Sr.] ***was a workaholic who sacrificed child-rearing to work at a furniture store he owned with a partner.*** *"His complete focus was on the store," Bill Sr. says.*

1934-1936 - Braman family buy lot in Bremerton next to W.H. Gates I residence and build custom mansion

Braman family : James d'Orma Braman (born 1901) / Source : [HN00YW][GDrive]

Mr. Gates Sr. [, son of William Henry Gates I ,] early on built a life outside of his home. Next door, the Braman family had two boys for him to play with and a father who would become his most important role model [for William Henry Gates II].

That man, Dorm Braman, had built his business and would later become a Naval officer, mayor of Seattle and a U.S. assistant secretary of transportation. In the late 1930s, Mr. Braman brought Bill Sr. on family road trips across the country. He was scoutmaster of Bill Sr.'s Boy Scout troop, leading the boys on hikes through the Olympic Mountains and driving them in a beat-up bus to Yellowstone and Glacier National Parks. The troop spent two years building a log house from Douglas firs they felled themselves. Mr. Braman had "no sense of personal limitations whatsoever," says Mr. Gates Sr.

1937/1938 - Father is the treasurer of the Bremerton Chamber of Commerce - Signs incorporation papers for the Bremerton Chamber of Commerce

HistoryLink.org article: Source : [HW0033][GDrive]

Heading for Depression

With peace went the booming prosperity of the second decade of the twentieth century, and Bremerton settled into a period of slower growth. Employment at the base tapered off from the wartime high of 6,500 to bottom out at fewer than 2,500 by 1927, but the town itself had grown to a point that many businesses could survive by serving the area's civilian population and the lessened needs of the military. Homes were being built, car dealerships opened, services expanded, and optimism prevailed.

Bremerton absorbed the next-door community of Charleston in 1927, further increasing its population and tax base. In 1928, construction began on the light cruiser USS Louisville, and employment at the naval yard jumped by 1,000, providing additional flotation to the local economy. In June 1929, just four months before the stock market crash and the beginning of the Great Depression, Bremerton voters passed an $835,000 bond issue to improve the city's water system and to build an electrical plant.

In November, after the bottom fell out of the world economy, work began on a bridge linking Bremerton with the former Manette, now East Bremerton, financed almost entirely by public subscription. When the full effects of the Depression set in, Bremerton, perhaps inured to some degree by the previous economic ups and downs of the naval yard, actually managed better than most towns and cities.

Surviving the Thirties

The Manette Bridge opened to great fanfare in June 1930, and with that completed the people of Bremerton tackled the Great Depression. A Puget Sound Navy Yard Stabilization Bureau was established to lobby in Washington D.C., for shipyard work, and each worker at the yard pledged $5 a year to support its efforts. They also agreed to regular payroll deductions to help support Kitsap County's unemployed, and all employed workers in the county were asked to give up one day's pay a month for the same purpose.

The federal government did its part too, and the shipyard actually expanded during the Depression years. Concerns over Japan's actions in the Pacific led to orders for several new ships. County projects funded by the Works Progress Administration also helped. So successful were these combined efforts that Bremerton experienced record growth in 1934 and 1935, and by the end of the decade its population had increased by half, to over 15,000. By 1940, when the national unemployment rate was still well over 14 percent of the labor force, Bremerton's stood at just 6.9 percent. Bremerton was doing well, and in 1937 its incorporated status was upgraded to city of the second class.

Business was good enough that the Bremerton Chamber of Commerce, which had been in existence since 1907, saw fit to formally incorporate in March 1938. The incorporation papers were signed by its treasurer, William H. Gates Sr., grandfather of Microsoft co-founder Bill Gates. And during the late 1930s and early 1940s, Bremerton was also home to the controversial founder of the Church of Scientology, L. Ron Hubbard.

1940 - US Census

http://search.ancestry.com/collections/2442/records/65196867

- Father William Henry Gates (born 1891) is still Proprietor, of a retail furniture
- James d'Orma Braman (born 1901) living next door
- Benjamin Harrison lives across the street (bio - https://www.findagrave.com/memorial/35013879/benjamin-franklin-harrison)

1943 - Enlists in WW2, serve 2 years

Article reference : [HM000F][GDrive] - BY LISA STIFFLER on November 25, 2015

His father owned, then sold and worked in, a furniture store. Neither of his parents went to high school. ***A year after his graduation from Bremerton High School in 1943, Gates Sr. received a letter ordering him to active duty. He enlisted in the U.S. Army, completed officer candidate school and was shipped to Japan shortly after its surrender. He traveled to Hokkaido, the nothernmost island of Japan, and a war-torn Tokyo.***

1949/1950 - University of Washington

(source - [HK002B][GDrive])

After the war, Gates attended the University of Washington under the G.I. Bill,[1] earning a B.A. in 1949 and a J.D. degree in 1950.

1949 (Sep 08) - In Bremerton, Washington (age 24)

Introduced to wife by Brockman Adams

PDF of book : [HB0053][GDrive]

"Their daughter Mary was born in Seattle in 1929. A vivacious young beauty she grew up among some of the most prominent families in the Northwest. Like her mother before her, Mary Maxwell met her future husband, a tall, **athletic, prelaw student by the name of Bill Gates, Jr.,** while she was a co-ed at the University of Washington. A school cheerleader, Mary was as outgoing and gregarious as Bill was shy and reserved. A mutual friend, [**Brockman Adams (Born 1927)**] , had introduced the couple while Adams was student body president, and Mary was an officer in the student government association. (Adams went on to a career in politics, serving as secretary of transportation under 7 President Jimmy Carter. He is currently one of Washington's U.S. senators and remains a close friend of the Gates family.)"

1951 - Marriage to Mary Maxwell

1952 - 195x - Working as Bremerton Assistant City Attorney

History Link source - [HW003L][GDrive]

" ***Mary Maxwell Gates (born 1929)*** *grew up in Seattle's North End and graduated from Roosevelt High School where she was class valedictorian and a star forward on the girls' high school basketball team. She received a degree in education from the University of Washington 1950. While at the UW, she met law student William H. Gates Jr. (as he was then known) and they married.* ***While he worked as a Bremerton Assistant City Attorney in the early 1950s, she taught school there.*** "

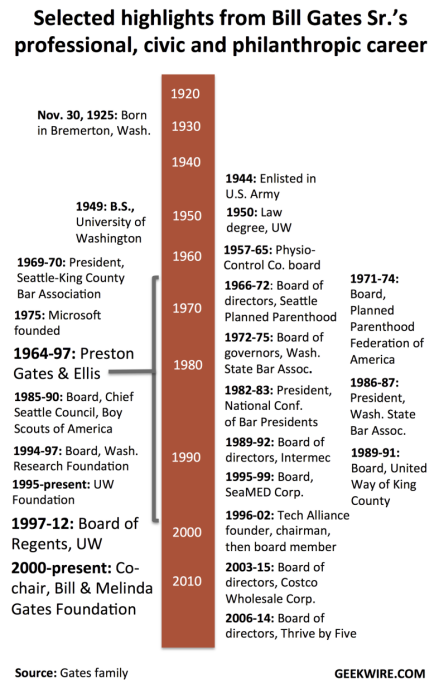
1954 - Mentor Braman elected to Seattle City Council

o Seattle in 1954, civic leaders in the area chose [**James d'Orma Braman (born 1901)**] . to run for Seattle City Council.

1957 - Gates joins board of DIrectors for Physio-Control Co.

See **Physio-Control Corporation** ; Article reference : [HM000F][GDrive] - BY LISA STIFFLER on November 25, 2015

Note that the company was only formed in 1955.



[HM000G][GDrive]

195x - Moved to Seattle, "practices law"

History Link source - [HW003L][GDrive]

After working as an assistant Bremerton City Attorney, he moved to Seattle where he practiced law.

1964 - "joined the firm of Shidler, McBroom, Gates, and Lucas as a partner "

History Link source - [HW003L][GDrive]

After working as an assistant Bremerton City Attorney, he moved to Seattle where he practiced law. ***He joined the firm of Shidler, McBroom, Gates, and Lucas as a partner in 1964.*** *In 1990, this became Preston Gates & Ellis.*

1963 - Physio-Control International - Hiring of first full-time President, W. Hunter Simpson.

See [HW005A][GDrive] . No doubt William Henry Gates II would have worked closely with **William Hunter Simpson (born 1926)** during this transition.

Note - *"spent his first year at Physio-Control raising $300,000 in venture capital, attracting local investors such as* ***Bagley Wright****, whose company,* ***Pentagram Corp.****, built the Space Needle for the Seattle World's Fair."* It would have made sense for William Henry Gates II to be involved - Remember, his mentor **James d'Orma Braman (born 1901)** has a role in that Seattle World's Fair.

In 1961, Edmark unveiled a defibrillator that operated on direct current. When a heart goes into fibrillation, it begins to flutter and is unable to pump blood through the body. Defibrillators administer an electrical shock, which momentarily stuns the heart and allows it to return to a regular heartbeat. Until Edmark introduced his DC Pulse Defibrillator, medical defibrillators used AC, or alternating current, which caused patients to spasm violently because of the high voltage. The DC defibrillator allowed surgeons to administer a more-controlled, low-voltage shock that restored the heartbeat without causing additional trauma.

Edmark licensed manufacturing and distribution rights to the DC Pulse Defibrillator and the Pressure Pulsometer to American Optical, one of the first big companies to enter the electronic medical-instruments industry. Over the next few years, Physio-Control, which had been bankrolled by Edmark and a few personal friends, received about $10,000 annually in royalties, which was plowed back into research.

Then in 1965, American Optical announced that it had refined Edmark's inventions to the point where it no longer felt it needed a licensing agreement with Physio-Control to manufacture and sell the devices. Without a source of revenue, Edmark faced a decision: either he could shut down Physio-Control or begin running it as a business instead of a research laboratory. He chose the later. He also asked [William Hunter Simpson (born 1926)], then Northwest district manager for IBM Corp. in Seattle, if he was interested in becoming Physio-Control's first full-time president.

[William Hunter Simpson (born 1926)] had known Edmark since 1963, when he had hired the cardiologist as a consultant. At the time, IBM, which designed the first heart-lung machine for the Mayo Clinic, had been interested in further exploring the medical instruments industry. Although it meant giving up a secure position and taking a cut in pay, Simpson accepted Edmark's offer, starting his new job in January 1966.

A graduate of the School of Business at the University of Washington, who also had studied pre-med, [William Hunter Simpson (born 1926)] spent his first year at Physio-Control raising $300,000 in venture capital, attracting local investors such as Bagley Wright, whose company, Pentagram Corp., built the Space Needle for the Seattle World's Fair. He also changed the name of the company to Physio-Control Corporation, and more narrowly defined the company's market niche. According to Harriet and Terry King in *The Team*, a book published by Physio-Control detailing its first 25 years, Simpson told the company's five employees, "Our immediate goal is to install coronary care systems in Puget Sound hospitals and smother them with love, attention and service. After that, when the time is right, we can think about marketing nationally."

1965 - William Henry Gates II last year on board of Directors for Physio-Control Co.

See **Physio-Control Corporation** ; Article reference : [HM000F][GDrive] - BY LISA STIFFLER on November 25, 2015

He stayed on helping the company though - he helped the company go public in 1971.

1966 - 1971 - Continues to help Physio-Control, even helping the company go public in 1971; So close with Bill Gates Sr that Jr is brought into the office to learn about the business and write reports

See **Physio-Control Corporation** ; Article reference : [HM000F][GDrive] - BY LISA STIFFLER on November 25, 2015

[...] Gates helped take **[Physio-Control Corporation]** public in 1971 — the same year that drivers on SeaTac's stretch of Highway 99 were confronted by an infamous billboard asking "Will the last person leaving SEATTLE — Turn out the lights" erected in response to a spate of layoffs at Boeing, then the region's largest employer. It was also four years before Gates Jr. and Paul Allen co-founded Microsoft, a company that would eventually reshape the Seattle region and the larger tech ecosystem.

The success of [Physio-Control Corporation] was "the beginning of that positive feedback of people starting a technology company and doing well and going on to found new companies, and to serve as an angel investor to others," said Malarkey, of the Technology Alliance.

The angel investing of Gates Sr. and his peers, she said, had "a spirit of community building."

And his dad's engagement in tech ventures helped fan his son's curiosity about the field.

"As a sixth grader, he had me go down and meet with Dr. Edmark and [William Hunter Simpson (born 1926) , who was Physio's president and CEO], and I wrote a long report about Physio-Control," Gates Jr. said. Gates later worked with some employees at Intermec to develop the tape reader that he and Allen used at Traf-O-Data, their pre-Microsoft venture created to analyze traffic-counting data.

See **Physio-Control Corporation**

Helicopter taking President Ford on first leg of a speaking tour also carries a portable machine that could save his life in case of a heart attack.

One of the President's Traveling Companions

by Doug Spangler

One of President Gerald Ford's constant traveling companions is Lifepak 4. This isn't another secret service unit, or a new bulletproof vest. But it's one of the most important precautionary measures the President has at his disposal. It may one day save his life.

Lifepak 4 is a portable, battery-powered cardiac defibrillator. This amazing piece of equipment stands ready to help the President in case of a heart attack or any other heart problem.

Should an attack occur, medical personnel would quickly take out two round, hand-sized paddles attached to the machine. These serve both as monitoring and defibrillation electrodes. Holding one paddle on the left side of the President's bare chest and the other paddle on his right front side, aides could immediately get a reading of his heartbeat on the Lifepak 4's cardioscope—a small, TV-type screen which emits a "beep-beep" sound. At the same time, the machine produces a permanent electrocardiograph on tape as a record of the episode.

These monitors would show at once what the President's heart is doing. If they indicate a cardiac arrest (when the heart completely stops or has ventricular fibrillation—a weak, rapid, and ineffective twitching of the heart muscle), the same paddles could then administer a brief, electric shock to restart his heart into regular beats. Special pushbuttons on the paddles release a 320-joules (watt-second) jolt—equivalent to 53,000 watts in 6/1000ths of a second. Another shock could be administered in less than 10 seconds.

When the monitors indicate a normal heartbeat, the President would be rushed to a hospital, with other cables fastened to his chest to provide continuous readings.

President Ford isn't the only individual currently being protected by the 36-pound, 8 by 14 by 19-inch portable device. A Lifepak travels with Secretary Kissinger on his shuttles. Another of the rechargeable nickel-cadmium battery devices is kept in the Capitol for use in a Congressional emergency. The U.S. military made good use of the machines during the Vietnam War. The Shah of Iran and the royal family of Saudi Arabia have models on hand.

For workers and players

More than 20 defibrillators have been placed along the Alaska pipeline construction route in case a worker has a heart seizure, and professional football teams, including the St. Louis Cardinals, Buffalo Bills and Cleveland Browns, have them in the clubhouse. Major airports keep them handy, as do a number of banks, industrial corporations and ski and tennis resorts. Some private individuals have shelled out the $4500 that a Lifepak 4 costs. There also is a lightweight defibrillator, powered by flashlight batteries, called Physio 260, that sells for under $1000.

The U.S. Government purchased its first two Lifepaks in 1969 for possible use by President Nixon. Rear Admiral William M. Lukash, President Ford's personal physician, told PARADE we have the "cardiac defibrillator in the event of an acute cardiac emergency associated with ventricular fibrillation or cardiac arrest. The initial consideration for having a defibrillator readily accessible developed because of former President Johnson's history of having had a previous coronary."

Lifepak 4 measures only 8 by 14 by 19 inches, but it has the power to overcome heart emergencies. Cost: $4500.

Speed is the key

In case of emergency, speed is essential. If a cardiac arrest remains untreated for as little as four to six minutes, the brain is damaged. If it continues beyond that, death is imminent.

Lifepak 4 is the top of a line of portable, battery-powered defibrillators produced by Physio-Control Corp. of Redmond, Wash. It was developed by Dr. William Edmark, a Seattle cardiovascular surgeon and director of research for Physio-Control.

"As a surgeon, I had expected it to be used mainly during operations," Dr. Edmark says. "But its real value proved to be for hospital intensive care units, which are administered by cardiologists. Today, however, resuscitation has basically moved out of the coronary care units. Lives are saved more now by the portable defibrillators out in the streets and homes."

Additional usefulness can come from an optional modulator, which, attached to the Lifepak, provides an FM signal for either a telephone or radio transmission of a patient's electrocardiogram. Medical aides using the modulator can relay heart data immediately to a hospital emergency room. A doctor can then instruct them on the proper course of action.

Doctors have them

Some 10,000 Lifepaks are now in use throughout the world, most of them in doctors' offices, hospital coronary care units, emergency rooms, operating rooms and recovery rooms. Many hospitals have cardiac defibrillators carried on carts, ready to be rushed to a patient's room in emergencies.

Yet the usefulness of the defibrillator doesn't end there. The American Heart Association reports that nearly 700,000 deaths result each year from heart attacks, with half the victims dying before they reach the hospital. This is why an increasing number of emergency care units are equipping themselves with Lifepaks or equivalent machines, ready to speed life-giving aid not only to the President but to the man in the street.

[HK002B][GDrive]

Born November 30, 1925 (age 94) **Bremerton, Washington**

Alma mater University of Washington (BA, JD)

Occupation Lawyer

Height 6 ft 6 in (198 cm)

Spouse(s)

- Mary Maxwel (m. 1951; d. 1994)
- Mimi Gardner (m. 1996)

Children

3; including Bill

William Henry Gates II[2] (born November 30, 1925), better known as **Bill Gates Sr.**, is an American attorney and philanthropist, and author of the book *Showing Up for Life: Thoughts on the Gifts of a Lifetime*. He is the father of Bill Gates, the co-founder of Microsoft.

One of a line of businessmen named William H. Gates, and sometimes called William Gates Jr. during his career, he is now generally known as **William Henry Gates Sr.** due to the greater prominence of his son Bill Gates (whose full name is William Henry Gates III). He has adopted the suffix "Sr." to distinguish himself from his more famous son.

Career

[...]

[Bill Gates... between 1951 and 1964 ???]

While at Washington he joined the Chi Psi fraternity. He co-founded Shidler & King in 1964, which later became Preston Gates & Ellis LLP (PGE). He practiced with the firm until 1998, when it was merged into the firm now known as K&L Gates (with which Bill Gates Sr. is not affiliated).

Gates has served as president of both the Seattle/King County Bar Association and the Washington State Bar Association. He has also served on the boards of numerous Northwest organizations, including the Greater Seattle Chamber of Commerce,[4] King County United Way and Planned Parenthood.[1][5][6] In 1995, he founded the Technology Alliance whose mission is to expand technology-based employment in Washington.[4]

In 1998, Gates retired from PGE. He served for fifteen years on the Board of Regents for the University of Washington,[7] and is a co-chair of the Bill and Melinda Gates Foundation,[1] which his son Bill and his daughter-in-law Melinda founded. He has served as a director for Costco Wholesale, a bulk retail corporation, since 2003. He is also a founding co-chair of the Pacific Health Summit.[8]

Gates is co-author, with Chuck Collins, of the book *Wealth and Our Commonwealth: Why America Should Tax Accumulated Fortunes*, a defense of the policies promoted by the estate tax.[9][10]

William H. Gates Sr. serves as an Honorary Chair for the World Justice Project.[4] The project works to lead a global, multidisciplinary effort to strengthen the Rule of Law for the development of communities of opportunity and equity.

Personal life

In 1951, he married Mary Maxwell Gates (1929-1994), whom he met at the University of Washington (UW), and they remained married until her death in 1994. They had three children: Kristianne, Bill, and Libby. His two daughters, Kristi Blake and Libby Armintrout, are both active members of the UW community.[1]

In 1996, Gates married his second wife Mimi Gardner Gates (b. 1943), who was the director of the Seattle Art Museum.[1]

He has been a lifelong supporter of the Washington Huskies college football team.[7]

In 2018, it was revealed that he suffers from Alzheimer's disease.[11][12]

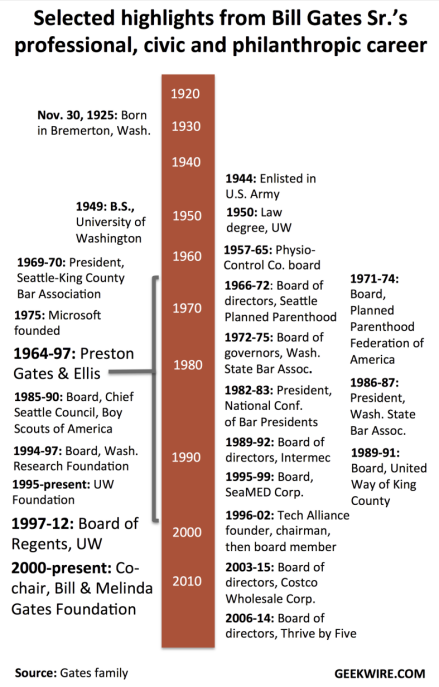
Awards and recognition

- Awarded Distinguished Eagle Scout Award, to acknowledge his business and civic success at least 25 years after earning Eagle Scout rank[13][14]
- [...]
- President of Washington State Bar Association, 1986–1986
- Recipient of University of Washington School of Law Distinguished Alumnus, 1991
- Recipient of American Judicature Society's Herbert Harley Award, 1992
- Served on Board for Judicial Administration, Washington State Supreme Court, 1993–1995
- Served on Board of Regents, University of Washington, 1997–2012
- Inducted into American Academy of Arts and Sciences, 2003
- William H. Gates Hall at UW's School of Law was named for him in 2003[15]
- Public Education Foundation speaker at Edmonds-Woodway, 2004
- Awarded Washington Medal of Merit, 2009
- Recipient of Chi Psi Fraternity's Albert S. Bard Award, 2010, for contributions to the intellectual and cultural life of the community
- Recipient of UW Alumni Association's Alumnus Summa Laude Dignatus (ASLD) Award, 2013[16]

Bill Gerberding (UW president, 1979–1995) described Bill Gates Sr. as "a good man with a big heart [and] generous public spirit", while former Seattle Mayor Norman Rice has characterized Gates' core values as "social justice and economic opportunity".[1]

Geekwire 2015 article - "Bill Gates Sr. at 90: A giant impact on technology, philanthropy and the Seattle region"

Article reference : [HM000F][GDrive] - BY LISA STIFFLER on November 25, 2015



[HM000G][GDrive]

[...] Or that Gates Sr. has been a tremendous civic leader, advocating for controversial causes including serving on the local and national boards of Planned Parenthood before Roe v. Wade, and campaigning as the face of a state income-tax initiative in Washington state. And there's his leadership for the world's largest philanthropic trust, plus supporting numerous other global health, education and arts charities, as well as his devotion to the University of Washington and 15 years on its Board of Regents.

"His fingerprints are all over so many things," said Jim Sinegal, co-founder and former CEO of Costco, on whose board Gates Sr. served. "The list goes on and on. It's pretty tough to find something that doesn't have his stamp on it somewhere along the line."

But those lists represent just a small portion of Gates' professional and charitable activities, and they only tell a fraction of his story. Because while his service on boards and his work leading fundraisers pack an epic CV, what most impresses the people who've worked and volunteered alongside Bill Sr. isn't found on his resume.

[...]

Early days of Northwest tech

[...]

Gates' first wife, Mary Maxwell, was a fellow UW Husky and they had three children together: Kristi, Bill (known by family and close friends as "Trey" in reference to the three card in a playing-card deck) and Libby.

Early in his law career, Gates Sr. and his law firm became involved in the region's nascent tech industry, and that involvement only strengthened and expanded over time.

[...]

Gates' early legal clients included Redmond's [Physio-Control Corporation], a pioneer in heart defibrillators led by Dr. Karl William Edmark, and Intermec Corp., an Everett-based business and creator of the most widely used barcode symbols and the hand-held barcode scanner. Gates was on the board of directors for both companies.

Gates helped take [Physio-Control Corporation] public in 1971 — the same year that drivers on SeaTac's stretch of Highway 99 were confronted by an infamous billboard asking "Will the last person leaving SEATTLE — Turn out the lights" erected in response to a spate of layoffs at Boeing, then the region's largest employer. It was also four years before Gates Jr. and Paul Allen co-founded Microsoft, a company that would eventually reshape the Seattle region and the larger tech ecosystem.

The success of [Physio-Control Corporation] was "the beginning of that positive feedback of people starting a technology company and doing well and going on to found new companies, and to serve as an angel investor to others," said Malarkey, of the Technology Alliance.

The angel investing of Gates Sr. and his peers, she said, had "a spirit of community building."

And his dad's engagement in tech ventures helped fan his son's curiosity about the field.

"As a sixth grader, he had me go down and meet with Dr. Edmark and [William Hunter Simpson (born 1926) , who was Physio's president and CEO], and I wrote a long report about Physio-Control," Gates Jr. said. Gates later worked with some employees at Intermec to develop the tape reader that he and Allen used at Traf-O-Data, their pre-Microsoft venture created to analyze traffic-counting data.

Stoking the tech engine

A few years after [Physio-Control Corporation] went public, Gates Sr. and others eager to grow the new economy began working with other angel investors to support the region's burgeoning biotech and IT industries.

Along with Simpson and venture capitalist Tom Cable, the trio founded Washington Research Foundation.

The nonprofit helps research institutions, including the UW, turn their discoveries into commercial products and invests in promising innovations. Established in 1981, the foundation was one of the first organizations of its kind nationally, and has secured more than 110 product licenses, earning more than $350 million for the UW. Gates brought his legal acumen to the project, drafting legislation that granted the organization tax-exempt status.

In 1975, Gates Jr. and Allen started Microsoft, though it wasn't until the 1980s that the company began taking off with the public release of MS-DOS, Microsoft's partnership with IBM on the early personal computer, and the introduction of Word and other Office products.

As the younger Gates was trying to grow his company, he came to his dad for advice on non-software decisions and relied on his parents for help recruiting talented employees, particularly those older than himself. Bill and Mary were adept at connecting people and integrating them into social networks.

"I was mono-maniacally focused on Microsoft and quite a bit younger than some of these experienced people we were bringing in," Gates Jr. said. "Even when I wanted to hire Steve Ballmer, [to get him] to drop out of business school, he was a year in, my parents had him over and were helpful."

But while Microsoft was growing, computer technology was still a foreign field to many. People didn't fully appreciate the value of the sector and the role that IT and biotech was to play in everyone's lives.

So in 1996, Gates Sr. helped launch the Technology Alliance, a tech-centered alternative to the more traditional chamber of commerce, which set about proselytizing the power of IT to local leaders. Part of their mission was visiting other tech hubs — Silicon Valley, Boston, North Carolina — and deconstructing what made them successful in order to try to replicate their strengths in the Northwest.

Gates Sr., who many say has a striking ability to see to the core of an issue and ask the right questions at just the right time, wanted to figure out a way to deliberately cultivate the technology field.

His idea was "maybe we should be smart about this and not rely on happenstance," said Marty Smith, a former partner at the Preston Gates & Ellis law firm and currently co-founder of MetaJure, a legal technology company.

The Technology Alliance went on to create the Alliance of Angels, one of the region's most important angel investment networks; as well as Ada Developer's Academy, a unique and intensive computer training program for women.

"This city would be very different without Bill having lived here," Smith said, "and that's nothing to do with Microsoft or Trey."

But as Gates Jr. and others explained, his dad wasn't driven so much by a fondness for technology, but by his love of education and the University of Washington, and his desire to promote strong communities and a robust economy. Technology, it seemed, could be harnessed to bolster many of his favorite causes.

"My dad is not a technology person," Gates said. "He got drawn into that, but he was about, 'How is this a great community to live in? How is it educating students really well?'"

'Justice and fairness for all'

Before technology and global health, even before Bill Jr. and his sisters, Gates Sr. was focused on the law.

He earned his law degree and passed the bar exam in 1950. He became heavily involved in the law's professional associations, including serving as president of the local and the state bar associations, holding multiple leadership positions with the American Bar Association, participating in numerous court commissions, and other posts.

The legal world was a natural fit with some of Gates' key values.

"This man has the most deeply rooted sense of justice and fairness for all people," said Connie Kravas, the UW's leader of fundraising and promotions.

Fellow attorneys said he had a great aptitude for the law, possessing a suite of five skills that makes him unusually talented in the field: He's an analytical, strategic thinker; empathetic to his clients; has a broad knowledge base; is a great listener and can put himself in his opponent's shoes; and, because he has all of these skills, is also well respected by other litigators and judges.

"Bill is one of the very few people I've seen that has all five," Smith said. "He was one of the most respected lawyers in town."

His son is among those who have benefited from Gates Sr.'s legal skills. Beginning in the 1990s, Microsoft faced a series of legal challenges stemming from government accusations that the company engaged in anti-competitive practices. Gates Jr. sought advice from his dad in the matter.

"We had a legal dispute early in Microsoft where I felt sure we were right and we ought to stay the course," Gates Jr. said. "He helped reinforce that."

Again, friends and colleagues cite Gates Sr.'s personal actions and demeanor among his greatest professional accomplishments.

Tom Alberg had just begun practicing law in Seattle when he met Gates Sr., who is 15 years older than himself. In the 1960s, Alberg was a local leader among young attorneys and they raised the call for equal rights for black and white lawyers. They needed support from Gates, who held sway in the legal

young attorneys and they raised the call for equal rights for black and white lawyers. They needed support from Gates, who held sway in the legal community.

"Bill treated us like equals," Alberg said. "He wasn't like, 'You young kids.' He was very gracious and listened to what we had to say, at least, and probably gave us good advice.

"He was always very open to younger people and younger lawyers," said Alberg, who went on to start the venture capital firm Madrona Venture Group and serves on the executive committee for Technology Alliance.

And Gates Sr. was more humane than one might expect a leader at a top firm to be. Colleagues tell stories of the respect with which he treated younger associates. He supported them when they asked for leaves to travel and start families.

Understanding the value of women

Perhaps most striking, Gates Sr. appears to have always regarded women as his equals, despite the fact that he joined the workforce at a time when America was just tuning in to June and Ward Cleaver on Leave It to Beaver.

"The firm was incredibly supportive of women," said Connie Collingsworth, general counsel at the Gates Foundation and former partner at Preston Gates & Ellis, which is now K&L Gates.

His support was genuine, said Collingsworth, who met Gates Sr. in 1990. "It wasn't that he was saying, 'I'm going to meet a quota or a mission agenda point.' It was subtle. He just did what he thought was right."

When Gates Sr. helped start the Technology Alliance, a groundbreaking organization addressing the issues of a male-dominated field, he chose Susannah Malarkey to head the group. Malarkey, by her own admission, wasn't experienced in tech, but Gates saw her potential.

"Bill was way ahead of his time," Malarkey said. "He understood the value of women when most men of his generation were pretty old school."

Not surprisingly, friends say Gates applauded the achievements of both of his wives: first Mary, who served as UW regent for 18 years and engaged in numerous civic causes before she passed away in 1994, and then Mimi Gardner, former director of the Seattle Art Museum.

"He was totally comfortable in his own skin and celebrated women accomplishing things," Malarkey said, noting the parallels between Gates Sr. and his son in this regard. "Bill celebrates Melinda's success in the same way that Bill and Mary supported one another."

Gates Sr.'s mother was the one who seeded his respect for women, Gates Jr. said. Gates Sr.'s mother, Lillian Elizabeth Rice, was very sharp, despite having only an eighth-grade education. Gates Sr. was also close to his first mother-in-law, Adelle Maxwell, whom Gates Sr. has described as independent and insightful.

"My two grandmothers, not to insult my grandfathers, were significantly more talented than my grandfathers," Gates Jr. said. They "were both very smart."

Trying to level the playing field

Gates Sr.'s quest for fairness and access to opportunities extended beyond his personal interactions into broader social causes, from fundraising at the UW to his leadership at the Bill & Melinda Gates Foundation.

But his pursuit of a more level playing field led to Gates Sr.'s most visible public defeat: the failure of a voter initiative to establish an income tax for Washington's richest residents.

Washington arguably has the most regressive tax structure in the nation, meaning the tax burden here is disproportionately higher for the poor than the rich. Gates and others sought to correct that disparity with a 2010 ballot measure, one that would have pumped funds into state education. The initiative would have created an income tax for individuals earning more than $200,000 annually and for couples with incomes of $400,000.

The measure pitted Gates against long-time friends [Daniel Jackson Evans (born 1925)] and Tom Alberg; Steve Ballmer, who in 2000 succeeded Gates Jr. as CEO of Microsoft; Amazon's CEO Jeff Bezos; as well as many other tech leaders. Both sides spent millions on the campaign, which supporters lost in a vote of 36 percent in favor and 64 percent against the initiative.

My dad "had a firm conviction" that the income tax was the right solution and "he thought a lot of people would come along and support him," Gates Jr. said. "Even as that coalition ended up being quite small compared to what he hoped for, he stuck with it."

And he didn't hold a grudge against those who saw the issue differently — a trait he displayed on countless occasions.

Opposition over the initiative "hasn't affected our 55-year-old friendship. It survives easy things like that," said Evans, a Republican who while governor had twice pushed for a state income tax as part of a broader package of tax reform.

In the five years since the initiative failed, the problem of income inequality has only become more exacerbated. Particularly in the greater Seattle area, an ongoing tech boom continues to push housing prices upward and some residents and leaders fear that lower- and middle-class workers will keep getting priced out of the city — a downside to the success of an IT economy that Gates Sr. surely would not have wanted.

"Seattle is certainly doing well at tech jobs at the moment," Gates Jr. said. "Some people think too well."

But Gates Sr. hopes that others will take on the challenge of working toward better communities in his home town and globally.

"[W]hat really makes Washington state great — and the rest of the Pacific Northwest for that matter — [are] the people. I am amazed by how many people have stepped up to help transform the local community into a global hub of partnership, big ideas and the determination necessary to solve tough problems at home and in poor countries," Gates Sr. said. "I don't see any signs of that letting up."

From a box of letters to a billion-dollar foundation

While Gates Sr. wasn't able to help usher in an income tax, he's had other avenues for his vision of a fairer world, namely his role co-running the multi-billion-dollar Gates Foundation.

"He's just the heart and soul of the foundation," said Collingsworth, general counsel for the organization. "He's there every day representing the family."

And he brings with him an enthusiasm that's helpful when tackling intractable problems of disease and poverty.

"When I come into the office, I am blown away by the signs of progress — both large and small — that prove the world is getting better," Gates Sr. said. "Earlier this year, for example, the country Nigeria celebrated going a full year without a case of polio. I remember when my children were young and polio was a real terror in the United States. To think that we have wiped out 99 percent of that awful disease — and that the job will, in all likelihood, be finished in just a couple years — is rather remarkable."

When I come into the office, I am blown away by the signs of progress — both large and small — that prove the world is getting better.

The foundation officially formed in 2000 through the consolidation of multiple charitable organizations supported by the Gates family and Microsoft. But in fact, Gates Sr. was playing an essential role in this arena well before the charity coalesced.

Evans recalled a time he was staying with Bill and Mary at their home in Palm Springs, Calif. Gates Sr. had a big box of letters from people seeking financial support from his son for a variety of causes.

"Bill was the one who said, 'Son, let me take a look at these,'" Evans said. "That was the beginning of the Gates Foundation." Gates Sr. perused the inquiries, sorted them and made recommendations to his son.

"Bill counseled him, 'It's time for you to begin thinking about what you can give back,'" Evans said.

The Seattle-based foundation has grown to nearly 1,400 employees worldwide helping manage and distribute grants from a trust that totals $41.3 billion. The organization has multiple initiatives, including global health, with an emphasis on vaccines, AIDS and malaria research; alleviating poverty and hunger in developing countries; and in the United States, the foundation is investing in high school and higher education, with a local focus on early learning.

He has this ability to recognize the humanity in everybody.

Friends say that Gates Sr. lives the foundation's credo that "every life has equal value."

"He has this ability to recognize the humanity in everybody," said Smith, Gates Sr.'s former colleague. Whether he's interacting with an HIV-positive child in India or a head of state, "to Bill there really isn't a difference. To him they're each human lives worthy of your attention and time."

Since it began, the Gates Foundation has issued $34.5 billion in grants. Gates Sr. is a co-chair of the foundation, with direction from his son and daughter-in-law and Warren Buffett, who has contributed billions of dollars to the foundation.

Gates Sr. "has been a steady influence right from the beginning," said Dr. Bill Foege, who recently retired as senior fellow for the Foundation's Global Health Program and served as former director of the U.S. Center for Disease Control. "He provides that sense of security."

In the late 1990s, Gates Sr. met with Foege, who came up with the strategy for eradicating small pox worldwide, to get his advice on the most worthwhile, promising strategies for addressing global health issues. Foege encouraged them to pursue vaccines, a path they were already exploring.

Working with Gates Sr. has provided Foege with some interesting insight into his own field.

"He has demonstrated to me that lawyers are more important than doctors when it comes to global health," Foege said. It turns out that in some cases, changing the law can do more than medicine to make widespread strides in health outcomes.

Global health needs to be "based on good science and the best results are based on good management," Foege said, "and management is often tied to the rule of law."

Because of its massive wealth, the organization is powerful and wields significant influence on public policy at home and abroad, and its investments in impoverished countries can change their very cultures — for good and, in certain cases, some would say ill.

He has demonstrated to me that lawyers are more important than doctors when it comes to global health.

Critics have raised concerns about the foundation's transparency and outsized-role in shaping the debate over public education in America. They admonish the group for favoring technologically-based solutions, including the use of fertilizers to boost agricultural output in developing countries.

At the same time, the foundation has fostered great achievements through immunizations that are curbing polio and other diseases, empowering women through support for family planning, funding teacher training and expanding online access to education.

"When I started medical school, which was almost 60 years ago at the University of Washington, I knew I was interested in global health," Foege said, but he couldn't find three other people on campus who shared his passion.

"In the past 15 years, this has become the most popular subject on campus after campus. The difference occurred in about 1999," Foege said, "when the Gates family took this on as an issue."

A roller-skating Santa at 6-feet, 7-inches tall

Towards the end of his 2009 book, "Showing Up for Life: Thoughts on the Gifts of a Lifetime," Gates Sr. ruminates on the challenge of imparting meaningful advice to college grads.

He writes, "Every time I am preparing to give a commencement address I go around for weeks asking myself and anyone else who will listen, 'What's most important for the graduates to hear about what matters in life?'"

He comes to the answer: Family, friends and public service, in that order.

In addition to his love of the law, the UW, the foundation and all his other causes and crusades, Gates Sr. — by his own admission and according to others — has strived to put family and friends first.

For Harold Kawaguchi, a former officer for Physio-Control and chairman of the board for Stratos Group, that commitment was clear from Gates' help when he was adopting children.

Gates Sr. was his personal attorney for the adoptions. "He didn't hand it off, he did it personally," Kawaguchi said. "He retained his personal touch even for things that wouldn't seem meaningful from a big business standpoint."

For Smith, who worked at Gates' firm, his boss was eager to celebrate the birth of his three daughters, and was the first to call after his wife had surgery.

"He was a mentor for me as a lawyer. He was a role model in terms of getting involved in the community and a facilitator in my doing that. He has been an incredibly good friend and listener," Smith said. "He's just a person who's been there in a way in my life that I never had growing up."

Former governor Evans remembers how much fun he's had with Gates Sr.

Their long-standing bridge group would go out for dinners every few months, hosted by the two losing players. One such occasion was co-hosted by Gates Sr., who devised a treasure hunt that sent the 12 diners across Seattle as they solved clues leading everywhere from an oyster bar in the old Olympic Hotel to Ivar's restaurant on the waterfront. It was a tremendous effort and a night they all cherished, Evans said

Evans also recalled a Christmas party the Gates held when their children were young. The Evans family arrived to find a roller-skating party. Gates Sr., at six feet, seven inches tall, was dressed as Santa Claus. On roller skates.

"A GIGANTIC AMBITION' // He's taking aim at global poverty

By LOUIS HAU

Published Aug. 2, 2006

Advertisement

The father of Microsoft Corp. co-founder Bill Gates met with Tampa Bay area business leaders and educators Thursday to urge them to join the fight against global poverty.

"It's a gigantic ambition," Bill Gates Sr. said during a breakfast at the Centre Club in Tampa. "But there isn't any progress that is going to be made unless people in this country become concerned about it and express their concern."

The 79-year-old Gates, a prominent Seattle lawyer who co-chairs the Bill and Melinda Gates Foundation, was in town in his capacity as one of the founders

The 77-year-old Gates, a prominent Seattle lawyer who co-chairs the Bill and Melinda Gates Foundation, was in town in his capacity as one of the founders of the Initiative for Global Development _ and in his celebrity role as someone who happens to share his name with the world's richest person. (Bill Gates Jr. is worth $51-billion, Forbes magazine estimates.)

The Seattle global development group seeks to recruit business and civic leaders as advocates for making aid to the world's poor a top priority among U.S. policymakers.

Fighting global poverty is of critical importance to U.S. security and economic interests, particularly after the end of the Cold War and the Sept. 11 attacks, said Daniel Evans, a former U.S. senator and ex-governor of Washington who co-founded the group.

An important dimension to that involvement is work to reduce the hopelessness and political extremism that can result from poverty, he said. To ensure the U.S. remains out front on the issue, Evans said "what we're attempting to do here is to mobilize the business and professional community of the country to influence and push on the Congress, on the president and on each other to join together in ending absolute poverty."

Tampa is one of 10 cities around the country the development group picked to encourage greater awareness among local business leaders about the importance of its cause, according to the group's managing director, Jennifer Potter.

In the group's search for a city in the Southeast, Tampa got the nod over Atlanta because of the visibility and influence of local members of Congress, including Rep. Jim Davis, D-Tampa, who is a Florida gubernatorial candidate, and Rep. Katherine Harris, R-Sarasota, a member of the House Committee on International Relations, Potter said.

The group is paying particular attention to that committee, as well as the House Appropriations Committee and the Senate Foreign Relations Committee because of their policymaking role in antipoverty efforts, she said.

Several bay area business people are working to raise awareness of global poverty. Calling themselves the Tampa Bay International Initiative Committee, they want to find a partner city in a developing country in which to help reduce poverty.

While some financial assistance would be implicit in any such effort, the Tampa Bay committee expects the primary contribution made by local businesses would be in advice and expertise, said Bill Flynn, an immigration lawyer at Fowler White Boggs Banker in Tampa.

Whatever efforts local businesses support in the partner city, "it shouldn't just be altruistic, but sustainable and justifiable on its own business merits," said committee member Peter Lewis, senior vice president for market strategies and development at GunnAllen Financial in Tampa.

"What we are looking at is sustainable ways to address the issues of poverty, but using practical, sustaining methods," Lewis said.

Also attending Thursday's breakfast was Kiran Patel, a prominent bay area philanthropist. During a group discussion about the best means to provide assistance to poverty-stricken areas, Patel told Gates and Evans that it would help to keep efforts focused on a particular geographic area. First demonstrate what can be accomplished there, he suggested, before taking on more far-reaching projects.

After the breakfast, Patel said efforts to fight poverty often result in "a lot of ideas but no action." Patel, whose international philanthropy includes supporting a hospital and schools in India, said he hopes national and local efforts to raise awareness of the issue will bear fruit.

"Otherwise, we will keep having breakfasts like this and nothing will get done," he said.

INITIATIVE FOR GLOBAL DEVELOPMENT

PURPOSE: An alliance of business and civic leaders seeking to make the elimination of global poverty a top policymaking priority for the United States.

FOUNDED: January 2003 by Bill Gates Sr., former Sen. Daniel Evans, R-Wash., former chairman of the Joint Chiefs of Staff John Shalikashvili and others.

NETWORK: Starting with 10 cities, including Tampa.

Mary Maxwell Gates (born 1929)

Wikipedia https://en.wikipedia.org/wiki/Mary_Maxwell_Gates

Married to William Henry Gates II (born 1925)

Children include William Henry Gates III (born 1955)

Associations:

- **Gordon Calvin Culp (born 1926)** (University of Washington Regents)
- **Daniel Jackson Evans (born 1925)** (College friend, bridge partner; Gov Evans assigned Mary gates to ta UW Regents role in 1975)
- **Brockman Adams (Born 1927)** (A future senator, but as a friend in college, introduced her to future husband **William Henry Gates II (born 1925)** [HB0053][GDrive])
- **James d'Orma Braman (born 1901)** (Scout leader, mentor, and life-long friend of husband **William Henry Gates II (born 1925)**)

Introduced to husband by Brockman Adams - See book "Hard Drive"

PDF of book : [HB0053][GDrive]

"Their daughter Mary was born in Seattle in 1929. A vivacious young beauty she grew up among some of the most prominent families in the Northwest. Like her mother before her, Mary Maxwell met her future husband, a tall, **athletic, prelaw student by the name of Bill Gates, Jr.,** while she was a co-ed at the University of Washington. A school cheerleader, Mary was as outgoing and gregarious as Bill was shy and reserved. A mutual friend, [**Brockman Adams (Born 1927)**] , had introduced the couple while Adams was student body president, and Mary was an officer in the student government association. (Adams went on to a career in politics, serving as secretary of transportation under 7 President Jimmy Carter. He is currently one of Washington's U.S. senators and remains a close friend of the Gates family.)"

Gates, Mary Maxwell (1929-1994)

By David Wilma Posted 1/01/2005 HistoryLink.org Essay 7188

History Link source - [HW003L][GDrive]

The Seattle civic activist and philanthropist Mary Gates and her husband William H. Gates strived to create a quality environment for their children inside their home, as well as outside in the community. The son and daughters of Mary and Bill Gates have all been active as volunteers in civic organizations within their communities. The Seattle-King County Association of Realtors named Mary Gates and her family First Citizens of 1995 for their community service and philanthropy. It was the first time in the 57 years of the award that the Association honored an entire family

Mary Maxwell Gates (1929-1994)

Mary Gates grew up in Seattle's North End and graduated from Roosevelt High School where she was class valedictorian and a star forward on the girls' high school basketball team. She received a degree in education from the University of Washington 1950. While at the UW, she met law student William H. Gates Jr. (as he was then known) and they married. **While he worked as a Bremerton Assistant City Attorney in the early 1950s, she taught school there.**

The Gates family moved to Seattle where William practiced law. Mary involved herself in a wide array of civic activities in Seattle, volunteering as a lecturer at the Museum of History and Industry, serving on boards for the Seattle-King County United Way, KIRO, Inc., Washington Gives, and Leadership Tomorrow. She was the first female president of King County's United Way, the first woman to chair the national United Way's executive committee, and the first woman to be a director of First Interstate Bank of Washington. A national United Way award was established in her name for "exemplary projects" typifying Gates' emphasis on cooperation between staff and volunteers.

In 1972, she joined the Board of Trustees at Children's Orthopedic Hospital and worked on a variety of committees before heading up the board's legislative affairs committee. She lobbied officials in Olympia and in Washington, D.C. on issues that affected the hospital and children. It was Gates who proposed to the trustees at Children's that they form a foundation to manage the hospital's investments and giving programs. When the Children's Hospital Foundation was organized in 1985, Gates chaired that board. She also chaired the committee that drew up a strategic plan for the board, which had been formed in 1907.

In 1975, Governor Dan Evans (b. 1925), a former bridge partner of Bill and Mary Gates, appointed Mary Gates to the University of Washington Board of Regents. In the mid 1980s, she led a movement on the board to cut, and then divest, the University's investments in South Africa to pressure the government there to change its racist and oppressive system of apartheid. She served more than 18 years on the Board of Regents. In 1993, the First Interstate Bank named Gates to its board of directors.

Mary Gates died on June 9, 1994, the day before she was to be honored by the Seattle Municipal League of King County as Citizen of the Year. "One of Seattle's greatest treasures has passed from the scene," said Mayor Norm Rice, who called her "an extraordinary civic leader and philanthropist, a champion for social justice and a remarkable human being."

William H. Gates Sr. (b. 1927)

Known then as William H. Gates Jr., Gates received his bachelor's degree (1949) and his law degree (1950) from the University of Washington. After working as an assistant Bremerton City Attorney, he moved to Seattle where he practiced law. **He joined the firm of Shidler, McBroom, Gates, and Lucas as a partner in 1964.** In 1990, this became Preston Gates & Ellis.

Gates served as president of the Seattle-King County and Washington State Bar Associations. In 1991 he received the University of Washington School of Law Distinguished Alumnus, and in 1992 he received the Washington Bar Award of Merit and the American Judicature Society Herbert Harley Award. He retired from the firm in 1997.

William Gates has worked hard for many area organizations, including the Seattle Chamber of Commerce, the Municipal League, the Seattle Foundation, and the Seattle Repertory Theatre. He also is a supporter of United Way and was chair of the Seattle-King County United Way Campaign in 1989.

He served on the University of Washington College of Arts and Sciences Visiting Committee (1966-1975) and the School of Law Visiting Committee (1983-1986). He has been a director of the UW Foundation since 1995 and a member of the Board of Regents since 1997.

In 1999 Gates took over the newly formed Bill & Melinda Gates Foundation, which was endowed by his son, William H. "Bill" Gates III, and his daughter-in-law Melinda French Gates. It is the largest philanthropic organization in the world and it focuses on Third World health, online learning, and education. Because of the prominence of his son who shares the name William H. "Bill" Gates, the elder Gates came to use "Sr." rather than "Jr." following his name.

Mary Gates Dies -- Cancer Claims Longtime Seattle Civic Leader And Mother Of Microsoft Founder Bill Gates

Jun 10, 1994

Source : Seattle Times : [HN00Z5][GDrive]

Paul Andrews

Mary Gates, one of Seattle's most prominent civic figures and the mother of Microsoft magnate Bill Gates, died at her Laurelhurst home early this morning after a months-long bout with breast cancer. She was 64.

Years before her son gained international prominence, Mrs. Gates was widely respected as a tireless community-service advocate, a prominent role model for women seeking corporate advancement, and a skilled behind-the-scenes negotiator. But when it came to accepting credit, she was careful to deflect the spotlight away from herself and onto her many causes.

"Mary is the perfect example of being able to get a whole lot done if you don't worry about who gets the credit," said the Rev. Dale Turner, a longtime family friend, in an interview earlier this year.

The granddaughter of a prominent Seattle banker and civic figure, J.W. Maxwell, Mrs. Gates liked to describe herself as "a Seattleite through and through." She was proudest of her 18 years as a University of Washington regent. But she was at least as well-known for having opened doors of corporate boardrooms and executive suites to women during the 1970s.

"There were very few women involved in government affairs, and I was determined to change that," said former Gov. Dan Evans in an interview earlier this year. Evans, a onetime bridge partner, named Mrs. Gates as a regent in 1975, only to succeed her on the board last year. He said Mrs. Gates had "broad community experience" and knew the inner workings of "some pretty big enterprises."

She was to be honored today by the Municipal League of King County as Citizen of the Year for her long career and successes in community service. In a press release on its annual awards luncheon, the League cited Mrs. Gates' efforts as a "judicious, exceptionally talented civic-minded citizen."

Last night, the UW Alumni Association honored Mrs. Gates with its annual recognition award. Her husband and three children attended the ceremony on the UW campus and accepted the award in her behalf.

Born in then-rural North Seattle in 1929, Mrs. Gates attended Bryant Elementary and Roosevelt High schools. She enrolled in the University of Washington, graduating in 1950 with thoughts of a teaching career. After marrying Bremerton assistant city attorney Bill Gates Jr., whom she had met as a law student at the UW, she taught junior high school in Bremerton and at Seattle's Jane Addams before the birth of daughter Kristianne in 1954.

After son Bill, born in 1955, and daughter Libby, in 1964, completed her family, Mrs. Gates turned to volunteerism with the Junior League, Children's Orthopedic Hospital and United Way.

In 1975, the year her son co-founded Microsoft, Mrs. Gates became the first woman president of United Way of King County, the first woman director of First Interstate Bank of Washington, and only the fifth woman regent. In 1983 she was named the first woman to chair the national United Way's executive committee.

Thoughtful and questioning in the Socratic method, Mrs. Gates was a steadying influence on the regents board during turbulent times. When the university's South African investments drew protest in the early 1980s, Mrs. Gates pushed first for adoption of the Sullivan human-rights principles and later for divestiture. She also steered the regent's fiscally strategic Metropolitan Tract Committee, in charge of the university's 11-acre property downtown, through critical lease negotiations during major building renovations in the 1980s.

Mrs. Gates was "a source of balance, wisdom and stability on the regents - its center of gravity," said UW President William Gerberding, in a recent interview.

Mrs. Gates also figured in her son's success. She helped cement Microsoft's early connection with IBM, which led to development of the IBM PC with DOS, an operating system supplied by Microsoft. When someone mentioned Microsoft to IBM President John Opel in 1980, Opel responded, "Oh, that's run by Bill Gates, Mary Gates' son." Opel served with Mrs. Gates on United Way's national board at the time.

Mrs. Gates was recalled as a gracious hostess by early Microsoft executives on visits to her Laurelhurst home after the company moved to Bellevue from Albuquerque in 1979. Later the Gates clan, under her stewardship, sponsored annual Microgames, Olympics-like summer competitions drawing local community leaders, software-industry executives and Microsoft employees to the family compound on Hood Canal.

The mother-son connection clicked in luring nationally known bioengineer Lee Hood to the UW from Caltech two years ago. The Microsoft magnate contributed $12 million to UW biotech research. And Mrs. Gates nudged her usually apolitical son to fight state budget Initiatives 601 and 602 last fall.

Throughout her career, Mrs. Gates promoted philanthropic causes. After the death of Ned Skinner in 1988, she took over Washington Gives, the civic volunteer project that urges people to donate 5 percent of their income and 5 hours a week of their time.

In 1991 the Gateses were named philanthropic family of the year by Washington Gives.

Mrs. Gates also helped launch Leadership Tomorrow, the future executives and entrepreneurs program, and served on the boards of **Unigard Security**, US West, Seattle Symphony, KIRO and the Children's Hospital Foundation.

Mrs. Gates is survived by her husband, Bill, a senior partner with the law firm of Preston Gates & Ellis; three children, Kristianne Blake of Spokane, Libby Armintrout and Bill, both of Seattle, and four grandchildren.

A memorial service will be at 4 p.m. next Thursday at University Congregational Church in Seattle.

The family has suggested remembrances be sent to the United Way Endowment Fund, 107 Cherry St., Seattle 98104-2223; or Cancer Lifeline, Suite 680, 1191 Second Ave., Seattle 98101.

Mary Gates -- She's Much More Than Just The Mother Of Billionaire Bill; This Former UW Regent Has Made A Career Of Community Service

Jan 9, 1994

Paul Andrews

If it is possible for someone at a wedding to be happier than the bride and groom, it was a beaming Mary Gates at her son's Hawaiian nuptials New Year's Day.

For Gates, 64, whose credentials in civic and corporate circles were cemented years before her now-famous son built Microsoft into a software megapower, Bill Gates' marriage to Melinda French represented a coming of full circle.

The mother of two daughters with families, Gates, now battling cancer, has long looked forward to her son's matrimony. He may be the fiercely competitive, fiercely independent billionaire mogul of the world's No. 1 personal-computer software company.

But he is still a son, and she a mother.

So much has her son achieved that Gates seems forever to be cast as "the mother of." Those who know Seattle, and know the Gates family, understand the paucity of the description. Only a little more than a decade ago, Microsoft Bill was known as "the son of."

In 1980, IBM President John Opel had already spent a couple of years on the national board of United Way with Mary. When the head of IBM's fledgling personal-computer project mentioned Microsoft to Opel, his response was, "Oh, that's run by Bill Gates, Mary Gates' son."

Gates came to her station partly by being a "supermom" long before the term was coined, juggling family and homemaking in Wedgwood and Laurelhurst with boardships on United Way, First Interstate Bank, US West and Children's Hospital, to cite a few.

"Mary never neglected her family responsibilities, even with all her other activities," said Seattle attorney Jim Ellis, who served with Gates on the University of Washington Board of Regents and on the editorial board at KIRO. **"She proved you could have it all."**

Gates says she was lucky: "The career I had was not 9-to-5 oriented, so I had more flexibility than a 40-hour-a-week job. Bill (her husband and a local attorney) really encouraged me to do interesting things in the community - he thought it was more fun to come home if I had something interesting to say at the dinner table. And my mother (Adelle Maxwell) spent a lot of time at our home."

In any case, supermomhood is only one dimension of Gates' contribution. From the regents' boardroom to the Children's Hospital Foundation, from KIRO to the Redmond halls of Microsoft, her impact radiates among multiple spheres of influence.

She herself is proudest of her 18-year tenure with the regents - third longest in its history - which saw the UW emerge from a big if unexceptional regional institution into an internationally known center of biotechnology, computer science, medicine and Asian studies.

"I felt it was really important at that time of anti-Vietnam and campus turmoil to get the university back on track," said Dan Evans, who as governor appointed Gates in 1975 and, in another coming of full circle, was recently named by Gov. Mike Lowry to replace her. "We needed a board whose members really understood how to reach out and connect with the community."

Gates said she had decided to step down from the regents even before her recent diagnosis of cancer. She is presently undergoing therapy "which is showing excellent results," her husband said.

"The opportunity to serve on the board of regents was a rare privilege for me," she said. "I care about education, it's a fine school, I have a lot of respect for Bill Gerberding. I'm going to miss it."

But Gates' most indelible imprint may stand as a "first woman to . . ." role model emerging from the feminist era of the 1970s. In 1975, a watershed year for her, Gates became the first woman president of King County's United Way and the first woman director of First Interstate Bank of Washington, and only the

second woman regent at the University of Washington (Dorothy Bullitt, founder of KING Broadcasting, became the first in 1958). By 1983 she'd become the first woman to chair the national United Way's executive committee.

"It was a time when there was lots of pressure from women's groups to be included in officer and board positions," Gates said. "I was relatively well-known to a lot of business people through my United Way work."

Although sympathetic to feminist causes, Gates said she was "never a leader in that movement. But I certainly was the beneficiary of the women who were willing to be more out front and aggressive."

What she did do was help introduce values of consensus and compromise to reflexively competitive male bastions.

"Mary has been a source of balance, wisdom and stability on the regents - its center of gravity," said William Gerberding, whom Gates as regents president helped hire in 1979. "Whenever there's been controversy, her rational presence was felt."

A "Seattleite through and through" who attended Bryant Elementary and Roosevelt High schools, Gates planned a career as a schoolteacher. In 1946 she entered the University of Washington, later serving her senior year as ASUW secretary to student-body President Brock Adams (later the U.S. senator) and as president of Kappa Kappa Gamma.

"She was a bundle of energy - very well-liked, popular and involved in a lot of outside activities," recalls Gordon Culp, a classmate who later joined Gates on the board of regents.

As the daughter and granddaughter of prominent bankers, Gates seemed destined for the role of young 1950s socialite.

A 1954 Seattle Times photo of her instructing three teenage daughters of Women's University Club members on hostessing was captioned, "Tea first, next cream and sugar and then the cookies and mints."

Serving on the ASUW budget and finance committee, she met a tall, thoughtful ex-GI law student from Bremerton named Bill Gates. The two wed in 1951. Bill served as assistant city attorney in Bremerton while Mary taught junior-high school there. When her husband moved to the Seattle law firm of Skeel, McKelvy, Henke, Evenson & Uhlmann, Mary taught at Jane Addams Junior High in North Seattle.

Then it was time to start a family with the birth of Kristianne in 1954, young Bill in 1955 and daughter Libby in 1964.

With Gates' mother, Adelle Maxwell, handling backup rearing chores, Mary supplemented momhood with a widening plate of volunteer and charity activities.

The biggest beneficiaries: Children's Hospital (then Children's Orthopedic), whose board she joined in 1972, and United Way (then United Good Neighbors), for which her father, Willard Maxwell, had served as treasurer in the late 1950s while vice president of Pacific National Bank (today First Interstate).

"When I first met her in 1958 as a new Junior League member, I remember saying afterward, `There's a real comer. She's going to go far in the community,' " said Kate Webster, who later was on the Children's board with Gates. "She wouldn't say, `This is a good idea' and leave it at that. She had great follow-through."

Gates has exercised countless deft, behind-the-scenes interlinkages of power over the years:

-- Nudging her fiercely apolitical son into outspoken opposition to state budget Initiatives 601 and 602 last fall.

-- Helping launch Leadership Tomorrow, responsible for seeding the area with hundreds of budding entrepreneurs and community leaders.

-- Helping get the Seattle Symphony and Children's Hospital on sound footing financially with smart, plugged-in fund-raising programs run by spun-off foundations.

-- Raising corporate community consciousness through Washington Gives, the 5-percent-a-year of income and 5-hours-a-week-of-time project she took over after Ned Skinner's death in 1988.

-- In 1991 the entire Gates clan was named philanthropic family of the year by Washington Gives.

-- And the mother-son connection, responsible for the latter's $12 million contribution to UW biotech research two years ago and luring of bioengineer Lee Hood from Caltech.

"Mary is the perfect example of being able to get a whole lot done if you don't worry about who gets the credit," said the Rev. Dale Turner, whose University Congregational Church the Gates family attended.

Gates decided to retire from the board of regents after she and her husband, a prominent attorney for years with Preston Thorgrimson, conducted a "trial retirement" last winter in Palm Springs, Calif., and found they enjoyed lighter duty.

But the Gates years were pivotal.

As chief of the fiscally strategic Metropolitan Tract Committee she helped oversee crucial leases of 11 downtown acres during a downtown construction era that, with construction of the Rainier Tower and renovation of the Four Seasons Olympic, brought Seattle to world-class status. The university kept the lucrative downtown property after moving north of the Ship Canal in 1895.

When the issue of South African investments tore apart the campus in the early 1980s, Gates pushed first for adoption of the Sullivan principles - written by a General Motors director in support of human-rights standards on investment - and later for divestiture, more as a means of keeping the campus from tearing itself apart than as a path clearly beneficial to the country itself.

"We grappled with the question, what was going to happen to the black people of South Africa if there were no employment?" Gates said. "There were sound arguments on both sides."

Gates is keeping busy. Just last month she was elected to the board of Independent Sector, a Washington, D.C.-based coalition for volunteerism and philanthropy, two Mary Gates touchstones.

Not all has gone smoothly for Gates in her community-service career. She got caught in the crossfire in 1984 when Children's Hospital began its own telethon fund-raiser on KOMO-TV, shifting from its traditional beneficiary, the annual Variety Club event on KIRO-TV, where Gates is a board member.

"The numbers were night and day," said Doug Picha, foundation director. "Mary did what was appropriate," even though it temporarily cost her support from KIRO President Ken Hatch.

"The decision to go to KOMO made me very unhappy, but Mary was caught in the middle," said Hatch, who calls the matter water under the bridge today.

The incident showed Gates' steeliness under fire, a characteristic those close to her say is consistently, albeit, sparingly deployed. As a freshman president of United Way in 1975, Gates had to face the moral indignation of community activists when the agency cut off funding for the Central Seattle Community Council Federation. Among other things, the Council lobbied against construction of the new I-90 tunnel and bridge.

To Mary, the action in retrospect seems as right as it did then. "They were more interested in social issues than they were in providing services," she said. Her mettle in an unexpected baptism of fire caught the attention of community and business leaders.

As a member of KIRO's editorial board, Gates lets her opinions be known, including her opposition to tax-limiting Initiatives 601 and 602. She's taken an active interest in the news side of KIRO, getting to know the staff and observing the news-gathering process.

Some KIRO staffers privately grumble that Gates goes so far as to interfere, as in two years ago when her name came up after Hatch killed a Channel 7 report concerning UW football players with arrest warrants for minor violations.

Hatch said Gates had nothing to do with his action: "Mary believes in separation of church and state and is sophisticated enough to know it comes at great penalty to fool around in the (news) arena."

Gates adamantly denies she played any role in the flap: "It was a clear conflict of interest."

Nonintervention has its drawbacks, too, as Channel 7 staffers discovered in trying to cover the Gates wedding on the island of Lanai. In that contest between mom and board executive, the mom side won. KIRO got no better access than the rest of the news media, which were kicked off the island.

Despite her contributions, Gates is disappointed women haven't cracked more glass ceilings.

"I'm surprised and disappointed that the progress that started in the mid-'70s hasn't continued at the same rate," she said. At the CEO level, she mentions Edmark's Sally Narodick "and then who else? I'm mystified. Whether it's because there isn't as much pressure now from women's groups, or whether it's because change takes a longer time than some of us want it to take, I don't know."

Microsoft hasn't done much better, she acknowledged, "although that kind of business probably isn't as conducive to including women, just because it has been a male-dominated field."

And Gates worries that United Way, which has had trouble meeting its goals despite offering more flexibility in giving, is losing its charter.

"The whole theory of United Way is that there's this citizen group that looks at the needs of the community, undertakes studies, and then allocates the money based on their expertise that none of the rest of us could have as individual citizens," she said. "And when the money starts getting 20 or 25 percent or more designated, the whole planning-allocations process really is invalidated. If you don't have that, what happens to United Way?"

Close observers bet that mother's influence eventually will emerge not only with Microsoft's maturation but with her son's closer community involvement.

"Mary was very instrumental in originally softening Microsoft's posture vis-a-vis being a good corporate citizen," said Scott Oki, ex-Microsoft vice president who has followed the Gates tradition in joining the board of regents and Children's Hospital Foundation. He attributes Microsoft's strong matching-funds program to the mother-son connection.

Her maternal charter fulfilled, Gates can watch as her son and bride finish their estate on the Lake Washington shoreline in Medina - the goal is by his 40th birthday late next year - and start, judging from floor plans, a large family of their own. Perhaps the highest tribute to Gates' parenting is that two of her three children - Bill and Libby, expecting her second child this month - have homes within a stone's throw of Mom and Dad's Laurelhurst place, and the third, Kristi, with two children of her own, visits frequently from out of town.

Gates thinks her son, who recently completed a term on the national United Way board, "is looking forward to more community involvement, once he's completed his role of building his company." One potential target: a local research institute in science or technology.

If so, it will mark yet another coming of full circle for Mary Gates.

Name: Adelle Thompson

Event Type: Birth

Event Date: 01 Dec 1903

Event Place: Enumclaw, King, Washington, United States

Gender: Female

Father's Name: William James Thompson

Father's Birth Place: LIVERPOOL, ENGLAND

Mother's Name: Ida Medcalf

Mother's Birth Place: Montesano, Grays Harbor County, Washington

Physician who attended to Birth: DR. H. H. Rust

Signed and Dated: Mrs. Adelle T. Maxwell 08April1942

Seattle Post-Intelligencer (WA) - October 31, 1987

Deceased Name: UW REGENT MARY GATES' MOTHER DIES AT 85

Adelle Thompson Maxwell , mother of University of Washington Regent Mary Gates , died yesterday. She was 85.

Mrs. Maxwell was born Jan. 12, 1902, in Enumclaw. She attended Enumclaw High School where she was a star forward on the women's basketball team and class valedictorian.

She graduated from the UW where she was a member of Gamma Phi Beta sorority. Active in community affairs, she was president of the Women's University Club and chairman of the Community Chest Neighborhood Drive.

Mrs. Maxwell was also an avid UW football fan and attended nearly every Husky home game for the past 40 years. Her husband, J. Willard Maxwell , preceded her in death in 1959.

In addition to her daughter, she is survived by her son-in-law, William H. Gates, a Seattle attorney and president of the Washington State Bar Association, and her grandchildren, Kristi, Libby and William Jr., co-founder of Microsoft Corp.

At her request, there will be no funeral services. Remembrances may be sent to the United Way of King County for the Willard and Adelle Maxwell Memorial Fund for Children.

Oct. 30, 1987. Dearly loved by her daughter, Mary Gates, her son-in-law, Bill, and her grandchildren, Kristi, Bill and Libby. She had many friends of all ages by whom she was affectionately know as "Gam". She was born in Enumclaw and attended Enumclaw High School where she was a star forward on the women's basketball team and her class valedictorian. She graduated from the University of Washington where she was a member of Gamma Phi Beta sorority. At the University, she met her husband, J. Willard Maxwell , with whom she shared a happy married life until his death in 1959. In addition to her devotion to her husband and family, she was active in community life, having been president of the Women's University Club and chairman of the Community Chest Neighborhood Drive. She was an avid sports fan, particularly of University of Washington football. She attended almost every Husky home game over the last 40 years. One of her great pleasures was her time on Hood Canal. The Maxwells vacationed there each summer for 50 years. In more recent years, she spent the entire summer in the family beach home and swam almost every day. At her request, there will be no services. Remembrances are suggested to the United Way of King County designated for the Willard and Adelle Maxwell Memorial Fund for Children.

Bill Gates' on his parents / family

Source - 2015 (December) Geekwire INTERVIEW: BILL GATES TALKS ABOUT HIS DAD'S INFLUENCE ON HIS LIFE, THE TECH COMMUNITY AND THE WORLD / Source - [HM000H][GDrive]

[...]

GeekWire: Your dad [...] helped take public Physio-Control [in 1971]. He seemed to evolve into being involved with the Washington Research Foundation, Tech Alliance. How would you characterize his role in promoting and fostering the development of the tech industry in the Northwest — aside from yourself?

Bill Gates: He got into a lot of those things primarily through his connection with the University of Washington, and wanting the university to be strong and help drive the success of the community. He realized the university played an absolutely central role in whether the jobs coming in related to the new sciences, including biology and IT-type stuff. It was really through the UW that he got involved in the Tech Alliance. They went down and toured Silicon Valley, went to Boston, went to North Carolina, tried to figure out what state policies, including the role of the university, was in doing those things. Can you attribute it to the Tech Alliance or Microsoft being here or a variety of factors? Seattle is certainly doing well at tech jobs at the moment. Some people think too well.

GeekWire: How important do you think his role was in all of it? He seems like someone who really connects dots, connects people, has this longer vision and orchestrates moving people together to facilitate.

Bill Gates: Yes, in a broad sense, yes. But my dad's not a technology person. … He was about, "How was this a great community to live in? How is it educating students really well?" He was involved in the **Municipal League**. He put more time into bar stuff [for the Seattle-King County Bar Association and the Washington State Bar Association]. He did so many different volunteer things, it's hard to categorize. The bar was certainly the biggest single thing he did. He had a lot of stuff about judicial reform and malpractice insurance for lawyers.

[...]

He came from Bremerton. Unlike my mother's parents, who were quite well off — that grandfather was a banker who had done quite well — that grandfather had only gone to sixth grade, and owned a small furniture store. He sold it before [World War II], so that when it actually did well he was just working there. His parents, although his mom was very sharp, weren't all that highly educated. In Bremerton, he met Dorm Braman [Gates Sr.'s Boy Scout Troop leader] and a bunch of people who activated his ambition and capability.

He came to the UW, went to war and came back to law school. There is a whole group of friends, of which [former three-time governor and U.S. Senator for Washington] Dan Evans was part… Various people who out of this small group of friends would go on to all do pretty high-visibility and high-impact stuff. Those were the friends who were coming to our house when I was young, a great group of people.

My dad expanded his horizons way beyond what he grew up with. That grandfather liked to watch the boxing matches. That was the main TV show he was interested in. And all my grandparents were strict Christian Scientists [a religious movement founded by Mary Baker Eddy in the 19th Century that believes in the power of prayer over medicine for healing the sick]. [...] Both my parents choose not to follow the strict, like no doctors, approach to things. In fact, my mom's father died of cancer in incredible pain and never saw a doctor. Ever. It's unusual that they were both Christian Scientists, they were from very different parts, very different backgrounds.

GeekWire: Does your dad have any traits that you would like to develop more in yourself?

Bill Gates: Yeah, I say in his book ["Showing Up for Life: Thoughts on the Gifts of a Lifetime"] "My dad is a little more cautious, wise." Not as over-the-top quite so quickly. There's a lot about my dad that I and others would love to have come more naturally. My dad is very good about how he makes things about the success of the activity, and not putting himself at the center of it… **He chose not to run for political office. There was a time he considered being a federal judge. Actually, when that opportunity came along, his law firm was in a situation where he decided he wouldn't do it**. He really couldn't leave the law firm at that point. I always thought he would be such a great judge. He shows no signs of regret because he passed that opportunity…. His law firm career went extremely well. But I think of him like a judge.

GeekWire: Talking to people for the profile of your dad, the accolades are just boundless. Is there any weakness that he has? Or anything he did where he might have said, "I wished I would have done that differently or better, or I could have been more effective somehow?"

Bill Gates: Well, my dad worked very hard when I was young. There was a pretty strong imbalance between the level of engagement that we had with my mother, who was also very successful and active. Libby, my younger sister, is nine years younger than I am. That is when women were being put on boards. So mom ended up on the board of the insurance company, the phone company, the university, and the bank. All these boards.

When I was young, my mom was busy, but not super busy. So my dad has shown some regret that he was so engaged in his work, that he let her do a lot of the communication. In fact, if dad was unhappy about something that was really unusual. Therefore, it was unquestionably something you better pay attention to…. [At the dinner table, my parents] were very good about talking about the work they were doing, which you can say that was centered on them. [...]

My two grandmothers, not to insult my grandfathers, were significantly more talented than my grandfathers… My two grandmothers were both very smart. His mother hadn't much education; I think she went to eighth grade or something. His father only went to sixth grade. She was smart. She was the one who would read the Christian Science lesson daily. Every morning, you would read this Mary Baker Eddy lesson. I don't know if my grandfather could have read it. She would always be the one who sat there and made a coffee and read the lesson. **That was the first thing they did when I would go over and stay at their house in downtown Bremerton. He had his mother who was very sharp. He had a sister who didn't get to go to college, which he felt kind of bad about because she actually helped support him.**

Then my mom was very capable. It is hard to compare my mom and dad, because they were both ambitious and both very smart. My mom was even more sociable, even more of a people-person than my dad. She was a very energetic person. So he had that experience… Certainly, the expectations were for my sisters to go to college or to be good at anything. My older sister worked as much as I did. Libby chose a little less, but she had a great college education. Did a lot of serious work for a period of time. Dad is pretty even-handed about those things….

In 2010, Gates Sr. helped lead the campaign for Initiative 1098, a ballot measure to create a state income tax for Washington, which is recognized as having one of the least fair tax systems in the country because it puts a heavier burden on low-income residents than the affluent. I-1098 would have brought more balance to the system. Despite the efforts of Gates and others — including a TV ad in which Gates Sr. gets dumped in a dunk tank — the measure failed. Among the opposition were some of Gates Sr.'s friends, including Steve Ballmer, who replaced Gates Jr. as CEO of Microsoft, venture capitalist Tom Alberg and former governor Dan Evans.

[...]

Bill Gates: My dad has a well-developed sense of justice. He decided there should be an income tax. Based on the voters, not that many people agreed with him. But he had a firm conviction about that and he thought a lot of people would come along and support him. Even as that coalition ended up being quite small compared to what he hoped for, he stuck with it. Next thing you know, my dad is in these ads where he is being dunked in the tank. What was my dad at the time, 78 or something like that? I was like, "Come on, dad."

It was like when he took the UW [Creating Futures] Campaign. First, he was reluctant, then he decided to do it. I said to him, "How come you don't have a co-chair?" I don't think anyone's been a single head of a campaign before or since my dad did it that way. It's not to say he didn't get lots of help. He has a network of people who help him with things. But he chose to at least have that top spot by himself, which ended up being a massive amount of work. And thank goodness, unlike the income-tax thing, that one was, in the end, quite successful. [The eight-year effort led by Gates Sr. raised nearly $2.7 billion.]

GeekWire: Do you ask your dad for advice with business?

Bill Gates: Sure. He has been helpful many times. Not about the specifics of Microsoft, because we have a lot of technology things. We had a legal dispute early in Microsoft [in which the government alleged the company was engaged in noncompetitive practices] where I felt sure we were right and we ought to stay the course. He helped reinforced that. That was good. My dad is wise, and so I have run things by him. Not software strategy, but decisions.

My parents created a really strong social environment. When new people would come in to work for Microsoft, my mom and dad would often have them over. I figured if they were well older than me, they did a better job at connecting them into the community and who they might want to get to know or what groups they might want to be a part of. I was mono-maniacally focused on Microsoft and quite a bit younger than some of these experienced people we were bringing in.

Even when I wanted to hire Steve Ballmer, to drop out of business school, he was a year in, my parents had him over and were helpful. They knew when I was trying to hire somebody and thought about how they could help. When somebody new was starting, that they could help embrace them.

GeekWire: So was it hard when Steve came out against the income tax, after your dad brings him into the fold?

Bill Gates: It is now just a friendly joke. When Dan Evans came out against it, I was like, "Oh, dad" because **Dan is a super liberal Republican.** He didn't like that particular form of the income tax. It is an interesting thing [how to implement an income tax]. Do you start [taxing] at the high end, and that's a Trojan Horse for doing it broadly, or do you just do it for the high-end [income earners]? Anyway, lots of people have different opinions.

People who pay high incomes in this state, their employees pay less in taxes than in other states. When you are trying to hire somebody who is thinking about going to California or Washington, it is a benefit to this state. When a company has to balance the benefit they get from that versus what it means for

the state not having enough revenue to do its job, it's a tough decision. Steve came down one way on that. I am super close friends with Steve. That was fine, that was his judgment, that is what he chose to do. If [the measure had lost] 51 percent to 49 percent, I could say, "That was it, Steve." [Given that I-1098 failed 64 to 36 percent] it's not like that was some definitive moment in my dad's quest for the truly-just income tax.

Evidence Timeline

Early Life -

Source - Wikipedia - Saved Aug 10 2020 [HK002A][GDrive]

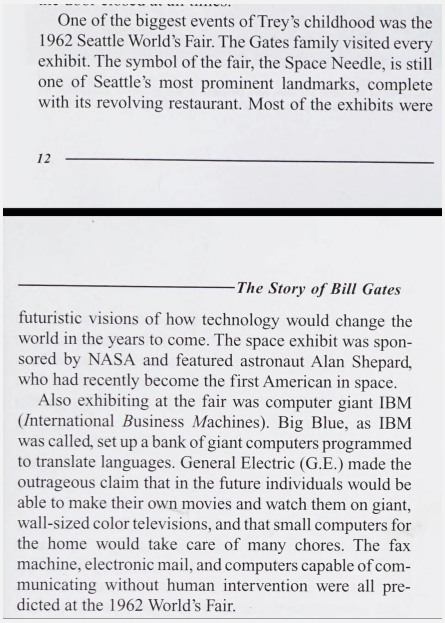
Gates was born in Seattle, Washington, on October 28, 1955. [...] His ancestry includes English, German, and Irish/Scots-Irish.[20] His father was a prominent lawyer, and his mother served on the board of directors for First Interstate BancSystem and the United Way of America. Gates's maternal grandfather was J. W. Maxwell, a national bank president. Gates has an older sister Kristi (Kristianne) and a younger sister Libby. He is the fourth of his name in his family but is known as William Gates III or "Trey" (i.e., three) because his father had the "II" suffix.[21][22] The family lived in the Sand Point area of Seattle in a home that was damaged by a rare tornado when Gates was seven years old.[23]

Early in his life, Gates observed that his parents wanted him to pursue a law career.[24] When he was young, his family regularly attended a church of the Congregational Christian Churches, a Protestant Reformed denomination.[25][26][27] Gates was small for his age and was bullied as a child.[22] [...]

1962 -Seattle World's Fair

Note that a key organizer was the finance chairman on the Seattle chamber of commerce - James d'Orma Braman (born 1901) :

1. James d'Orma Braman (born 1901) went on to become the mayor of Seattle, and serve in President Nixon's white house cabinet
2. James Braman was also the boy scout master of William Henry Gates II (born 1925) , Bill Gate' father
3. James Braman was a Navy admiral in WW2, and neighbor of William Henry Gates (born 1891) , Bill Gate's paternal grandfather



One of the biggest events of Trey's childhood was the 1962 Seattle World's Fair. The Gates family visited every exhibit. The symbol of the fair, the Space Needle, is still one of Seattle's most prominent landmarks, complete with its revolving restaurant. Most of the exhibits were

12

The Story of Bill Gates

futuristic visions of how technology would change the world in the years to come. The space exhibit was sponsored by NASA and featured astronaut Alan Shepard, who had recently become the first American in space.

Also exhibiting at the fair was computer giant IBM (*I*nternational *B*usiness *M*achines). Big Blue, as IBM was called, set up a bank of giant computers programmed to translate languages. General Electric (G.E.) made the outrageous claim that in the future individuals would be able to make their own movies and watch them on giant, wall-sized color televisions, and that small computers for the home would take care of many chores. The fax machine, electronic mail, and computers capable of communicating without human intervention were all predicted at the 1962 World's Fair.

1960s - Bill Gates' fatherwas involved in a variety of tech compnies in the Puget sound area

Source - 2015 (December) Geekwire INTERVIEW: BILL GATES TALKS ABOUT HIS DAD'S INFLUENCE ON HIS LIFE, THE TECH COMMUNITY AND THE WORLD Source - [HM000H][GDrive]

GeekWire: Your dad was involved with early tech businesses like Physio-Control, Intermec and SeaMED. What interested him? Where did he find his fascination with innovation and technology?

Bill Gates: Well, his law firm got involved in those. **Actually, as a sixth grader he had me go down and meet with Dr. Edmark and Hunter Simpson**. I wrote a long report about Physio-Control. Intermec, they did a tape reader. The original Traf-O-Data tape reader I got some guys at Intermec to build. My dad had a mix... He had quite a variety of clients including those. I wouldn't say it was all heavy science or engineering.

1967 [est] - As sixth grader, Bill Gates getting jobs from father to write reports for tech companies that his father is a board member of [in this case, Physio-Control] @

Article reference : [HM000F][GDrive] - BY LISA STIFFLER on November 25, 2015

Actually, Bill Gates Sr. was on the board of **Physio-Control** since 1957

[Bill Gates Sr.'] early legal clients included Redmond's Physio-Control Co., a pioneer in heart defibrillators led by Dr. Karl William Edmark, and Intermec Corp., an Everett-based business and creator of the most widely used barcode symbols and the hand-held barcode scanner. Gates was on the board of directors for both companies.

Gates helped take Physio-Control public in 1971 — the same year that drivers on SeaTac's stretch of Highway 99 were confronted by an infamous billboard asking "Will the last person leaving SEATTLE — Turn out the lights" erected in response to a spate of layoffs at Boeing, then the region's largest employer. It was also four years before Gates Jr. and Paul Allen co-founded Microsoft, a company that would eventually reshape the Seattle region and the larger tech ecosystem.

The success of Physio-Control was "the beginning of that positive feedback of people starting a technology company and doing well and going on to found new companies, and to serve as an angel investor to others," said Malarkey, of the Technology Alliance.

The angel investing of Gates Sr. and his peers, she said, had "a spirit of community building."

And his dad's engagement in tech ventures helped fan his son's curiosity about the field.

"As a sixth grader [meaning.. Bill Gates is about age 11, and this is about 1967...], he had me go down and meet with Dr. Edmark and [Physio's president and CEO] Hunter Simpson, and I wrote a long report about Physio-Control," Gates Jr. said. Gates later worked with some employees at Intermec to develop the tape reader that he and Allen used at Traf-O-Data, their pre-Microsoft venture created to analyze traffic-counting data.

1960s (date) - Bill Gates as a Student got inspired by philanthropic work of John D. Rockefeller and Andrew Carnegie.

Source - AstrumPeople article - Source PDF - [HW003M][GDrive]

Note : Daniel Jackson Evans (born 1925) was friend of the family, and competing against **John D Rockefeller** for the US VP nomination

[...] : Also while being a student, Gates got inspired of the philanthropic work of John D. Rockefeller and Andrew Carnegie. In 2000, Gates together with his wife Melinda founded Bill & Melinda Gates Foundation to support low-income countries.

Interview: Bill Gates, Co-Founder and Chairman, Microsoft Corporation - March 17, 2010, Seattle, Washington

Source - [HW003P][GDrive]

Could you tell us about the role of the Lakeside School Mother's Club in introducing you to computers?

Bill Gates: The Lakeside's Mother's Club had a rummage sale every year to raise money for the school. And instead of just funding the budget, they always would fund something kind of new and interesting in addition. **And without too much understanding, they decided having a computer terminal at the school would be a novel thing. It was a teletype -- upper case only, ten characters a second -- and you had to share a phone line to call into a big time-sharing computer that was very expensive. When you were connected up it would charge, and then when you actually had a program running it would charge a lot more.** So they set up this teletype, and some of the math and science teachers played around with it. One of them accidentally spent a lot of money with an infinite loop program. They spent like $200 by surprise. So they were a bit intimidated, and a bunch of us kind of hung out there and tried out different things. **The programming language was BASIC, which was quite novel at the time. It had been invented by some Dartmouth professors.** So that was the first computer language I learned, and I wrote increasingly complex programs. So that eighth grade exposure was a pretty neat thing, even though the machine we were working on was quite limited.

Even most colleges didn't have one of those at that time.

Bill Gates: No, the idea of students playing around with a computer was very unusual at the time. In fact, that computer -- eventually the costs were high enough they took it away. But then some other computer companies had come around, including one in Seattle, that a bunch of us went down and volunteered to help out and do some work for. So from that point on we always managed -- although it was dicey at times -- to find access to computers. That was very unusual in high school. But it took a lot of initiative on our part to get those experiences, but we wouldn't have done it if we hadn't had that early eighth grade exposure.

[...]

To someone who's never done any programming, can you describe what made it so exciting to you at the beginning?

Bill Gates: Well, programming is where you're describing to the machine how to do something-- telling it how to play tic-tac-toe, telling it how to play the board game Monopoly, telling it how to convert numbers from one base to another. There are these simple instructions, but if you put them together you can synthesize something quite complex. It's a fascinating kind of mathematical thing. How can you make it fast? How can you make it small?

I went through several phases of doing more complex programs where people who were great programmers would look at my work, give me feedback on it, and you get so you can be quite a good programmer. It was kind such an intense activity, between the age of 13 and 17, that we learned a lot. Eventually one of the programs we took on was the idea of the scheduling of our school. When should the classes meet? Who should be in what section? You have all these requests for people who want different classes, and keeping them small, and not having the teachers teach too many classes in a row -- very complex kind of software problem. And actually, when the school first asked me to do it when I was 15, I said that I didn't know how and they asked some adults to do it, and that didn't work. Then, about a year later, I'd figured out how to do it, and so my friends and I actually did the software that did all this high school scheduling. It had some fantastic benefits to us, and we got paid for doing it. It was exactly the kind of complex problem that developed my skills very well. And we got some degree of control over who was in our classes, so it combined the best of everything!

We've read that at one point your fellow members of the computer club at Lakeside kicked you out. Is that true?

Bill Gates: Yeah. Initially, when that teletype showed up, there were probably 20 kids who showed an interest. It was confusing enough that it got whittled down to about eight or nine fairly quickly who were quite serious about it. Then there were about four of us who were hyper-serious, doing it day and night. Two of them were two years older than I was, and one was my same age. Now in a high school, people that are two years ahead of you, they don't socialize with the young kids all that much. So the idea that we had this group, the four of us, was kind of unusual. We called it the Lakeside Programming Group. One of the companies we had been doing work for went bankrupt, the one in Seattle, and so we went to one in Portland, Oregon.

Was that C Cubed?

Bill Gates: Yes, Computer Center Corporation -- C Cubed -- which had been in the University District in Seattle. We'd spent a lot of time there, and they were wonderful to us, but they weren't a well run business, so they went bankrupt. **This company down in Portland, Oregon said, "Hey, we're not just going to give you computer time, you have to do something." So we agreed to write this payroll program. And a payroll program is surprisingly complicated. There's all these taxes and reports and things at the state level and federal level. Anyway, they said, "Well, if you could write one of those, we'd at least give you free computer time." So I negotiated that deal, and the two older members -- Paul Allen and Rick -- said, "There's not enough work to go around, so we're going to take charge of this." And I said, "Okay, I'm not that interested," because I had in mind how I wanted to do the payroll program. So they messed around for about three months, didn't get much done, and then said, "Will you join back up?" And I said, "Okay, but if so, I'm in charge of this," and it's going to kind of set a precedent for future activities. But they said, "No, no. That's fine." And so we worked. We actually finished this payroll program. It was a lot of work. The friend who was my age, Kent Evans, and I ended up doing the lion's share of the work. Now tragically, right as he and I finished that he was killed in a mountain climbing accident.** So then there were just three of us left who'd been extremely involved, including Paul Allen, who was the one who was reading the magazines even more than I was. He was the one who actually saw this computer on a chip -- a so-called "microprocessor" -- in a very small obscure article. He saw that it would be deeply important and brought that to me in 1971. So we were still 15 -- I was 15, and he was 17 at the time.

Was it during your work with C Cubed that you got into some trouble for hacking into a system?

Bill Gates: These C Cubed people have this computer, which is a time-sharing computer, and they're letting us come in at night. **And they had this deal with the company who made the computer, Digital Equipment Corporation, that they had this acceptance period.** If they could find problems with it, they could delay their rental payments. So they thought of us as kind of monkeys that might find some problems and help them delay their rental payments. Well, that was a fair analysis, because at first we were just completely goofing around. Like, we'd try to run hundreds of jobs at the same time, or have all the jobs

try and grab the same resources, to see if we could get the system to fail. And we did, in kind of this brute force approach. So they would report that as a problem and delay their rental payment. Well, a few months went by, actually about four months by the end of it. We had gotten very sophisticated. **In fact, we'd gotten the source code of the operating system out of the garbage can, and were reading it, and the kind of problems we were finding were far more subtle. In fact, we would not only find the problem, we'd look and we'd suggest how they might fix it.** Anyway, Digital Equipment got so tired of this they said, "Look, you've got to pay. You're going to be able to find these kinds of problems forever, but we need to get paid." So then there was a question whether they would let us stay there or not, and it was pretty tenuous. So Paul and I, we understood the system well enough that we could look at all the passwords of the various accounts, so we would use literally any account. And then, people -- when they found out we had done that, they got kind of mad about that. They weren't sure how mad they should be about it, because we hadn't really caused any damage, but it wasn't a good thing. Computer hacking was literally just being invented at the time, and so fortunately we got off with a bit of a warning. But there actually was a period that, because of that, they said we weren't supposed to use the computer. It was over a summer, and Paul actually went up to the University of Washington and found ways to use the computer and get connected up. He took a while before he told me and then eventually he told me about that and we got back on.

1966 (Sep - est.) - Bill Gates moves from public to private school / Starts at Lakeside in 6th grade @

Source : Interview: Bill Gates, Co-Founder and Chairman, Microsoft Corporation - March 17, 2010, Seattle, Washington Source - [HW003P][GDrive]

[...] What about school in general? You were a great reader. Otherwise, what kind of a student were you?

Bill Gates: Well, through eighth grade I was sort of enjoying the fact that I could do reasonably well without any effort. They had this thing where you'd get an "effort: which would be one, two or three, and then a grade. And so the ideal I always wanted was an A3, where you had the least effort, but the greatest grade. So my grades weren't all that great. **And then in eighth grade I had been at a private school for a couple of years *[suggests Gates started at Lakeside during his 6th grade]*** and decided that I better start getting good grades, both in terms of having some freedom, the way I'd be treated, and thinking about college. So from ninth grade on, I had a reasonably spotless grade record. I got quite serious about grades at that point.

Were you always good at math?

Bill Gates: Math was the thing that came most natural to me. And you know you'd take these exams, some of which were sort of nationwide exams, and I did quite well on those. That gave me some confidence, and I had some teachers who were very encouraging. They let me read textbooks, they encouraged me to take a college course on symbolic math, which is actually called algebra. So I felt pretty confident in my math skills, which is a nice thing, because not only the sciences, but economics, a lot of things if you're comfortable with math and statistics and ways of looking at cause and effect, that's extremely helpful.

Do any particular math teachers come to mind from that era?

Bill Gates: I had one named Paul Stockland at the school who challenged me. Later one named Fred Wright who challenged me. I actually majored in math for the time I was at college, because it's a very interesting topic. [...] 🌍

Early 1968 (for 1967/68 School year) - LakeSide school begins acquisition of computer facilities.

Source - Personal Computer Book Paperback – April 1, 1990 - by Peter McWilliams (Author) / Chapter 6 - At [HB004B][GDrive]

During the 1967/68 school year , the [Lakeside School] teaching staff recommended acquisition of computer facilities to expose the students to the technology . The school could not afford to purchase a computer . However the Lakeside Mothers Club agreed to finance the use of a time sharing service . In 1968 the school obtained an ASR-33 Teletype terminal and used a local access line to dial into a General Electric Mark II time sharing system .

NOTE - General Electric Mark II

See https://en.wikipedia.org/wiki/Dartmouth_Time_Sharing_System

2020-08-28-wikipedia-dartmouth-time-sharing-system.pdf

I mean... so Lakeside basically had access to the start of the art GE-635 using the very same DTSS/BASIC developed by Dartmouth

And they got it almost immediately when it was available (request made in late 1967 ... access in 1968...)

Dartmouth Time Sharing System, version 2

Honeywell GE 635 Computer Hardware at Kiewit, early 1971

From 1966-1968, DTSS was reimplemented on the GE 635,[4] still using the DATANET-30 for terminal control. The GE 635 system was delivered in November 1966. By October 1967, it was providing a service based on Phase I software, jointly developed by Dartmouth and GE, which GE subsequently marketed as the GE Mark II system[23]. In parallel with this work, Dartmouth embarked in 1967 on the development of Phase II under the direction of Professor John Kemeny, with programming carried out by students and faculty. Phase II of the Dartmouth Time-Sharing System replaced Phase I on 1st April 1969 at Dartmouth[24].

As described in 1969, the new DTSS architecture was influenced by three criteria[25]:

- The experiences with the 265 system.
- The published concepts of the Multics system.
- A realization of the limitations of the capabilities of a part-time staff of Dartmouth students and faculty members.

1968 - CCC / Lakeside

Source : **AstrumPeople** article - Source PDF - [HW003M][GDrive]

Note below ... they say "**At that time, the system based on DEC PDP-10 micro-architecture was a basis on the market**" .. but they were using the GE system, not the PDP at Lakeside ..

[...] In 1968, [the Lakeside] school administration decided to buy a computer time from the General Electric Company. **At that time, the system based on DEC PDP-10 micro-architecture was a basis on the market.** Later, he said: *"When I was thirteen, my school (Lakeside School) installed a teletype machine. From that point on, my friends and I spent most of our free time writing programs and figuring out how to make the computer to do interesting things."* **The school administration had underestimated its students – the whole year of the computer time was used in a few weeks. Fortunately, a new student arrived in Lakeside, whose father worked as a senior programmer in Computer Center Corporation (CCC).** The new contract allowed Gates and his friends to continue their experiments.

Young hackers quickly figured out the intricacies of the machine, found the weaknesses and started causing trouble – they broke the defense, which on several occasions led to a system failure and changed the files that contained records of computer time. CCC noticed that breach, and set them aside from working with computers for a few weeks.

Meanwhile, the company's business began to suffer from constant failures and poor protection. Remembering the destructive activities of computer users from Lakeside, CCC invited Bill Gates and his friends to identify flaws and security holes. As a payment, the company offered endless computer time for young hackers. Sure thing, Bill and his friends could not refuse. Since that day boys couldn't say if it was a day or night outside – they were hanging out in the lab all the time. For instance, one project of Gates was a program for scheduling classes. 'Somehow', it constantly redefined Bill to the classes with the prettiest girls. In addition to troubleshooting, they studied each material on automated calculations and improved their skills. [...]

1968 - Paul Allen's first access to a computer; it was at Lakeside

Source : MAY 2011 article in Vanity Fair - By Paul Allen - MICROSOFT'S ODD COUPLE / THE TECH REVOLUTION : [HP0030][GDrive]

In the words of narrator Paul Allen:

*[...] My honors-geometry teacher [at my high school in Seattle ... Lakeside...] was **Bill Dougall**, the head of Lakeside's science and math departments. A navy pilot in World War II, Mr. Dougall had an advanced degree in aeronautical engineering, and another in French literature from the Sorbonne. In our school's best tradition, he believed that book study wasn't enough without real-world experience. He also realized that we'd need to know something about computers when we got to college. A few high schools were beginning to train students on traditional mainframes, but Mr. Dougall wanted something more engaging for us. **In 1968 he approached the Lakeside Mothers Club, which agreed to use the proceeds from its annual rummage sale to lease a teleprinter terminal for computer time-sharing, a brand-new business at the time.***

*On my way to math class in McAllister Hall, I stopped by for a look. As I approached the small room, the faint clacking got louder. I opened the door and found three boys squeezed inside. There was a bookcase and a worktable with piles of manuals, scraps from notebooks, and rolled-up fragments of yellow paper tape. The students were clustered around an overgrown electric typewriter, mounted on an aluminum-footed pedestal base: a Teletype Model ASR-33 (for Automatic Send and Receive). **It was linked to a GE-635, a General Electric mainframe computer in a distant, unknown office.***

The Teletype made a terrific racket, a mix of low humming, the Gatling gun of the paper-tape punch, and the ka-chacko-whack of the printer keys. The room's walls and ceiling were lined with white corkboard for soundproofing. But though it was noisy and slow, a dumb remote terminal with no display screen or lowercase letters, the ASR-33 was also state-of- the-art. I was transfixed. I sensed that you could do things with this machine.

*That year, 1968, would be a watershed in matters digital. In March, Hewlett-Packard introduced the first programmable desktop calculator. In June, Robert Dennard won a patent for a one-transistor cell of dynamic random-access memory, or DRAM, a new and cheaper method of temporary data storage. In July, Robert Noyce and Gordon Moore co-founded Intel Corporation. In December, at the legendary "mother of all demos" in San Francisco, the Stanford Research Institute's **Douglas Engelbart** showed off his original versions of a mouse, a word processor, e-mail, and hypertext. Of all the epochal changes in store over the next two decades, a remarkable number were seeded over those 10 months: cheap and reliable memory, a graphical user interface, a "killer" application, and more.*

It's hard to convey the excitement I felt when I sat down at the Teletype. With my program written out on notebook paper, I'd type it in on the keyboard with the paper-tape punch turned on. Then I'd dial into the G.E. computer, wait for a beep, log on with the school's password, and hit the Start button to feed the paper tape through the reader, which took several minutes.

At last came the big moment. I'd type "RUN," and soon my results printed out at 10 characters per second—a glacial pace next to today's laser printers, but exhilarating at the time. It would be quickly apparent whether my program worked; if not, I'd get an error message. In either case, I'd quickly log off to save money. Then I'd fix any mistakes by advancing the paper tape to the error and correcting it on the keyboard while simultaneously punching a new tape—a delicate maneuver nowadays handled by a simple click of a mouse and a keystroke. When I achieved a working program, I'd secure it with a rubber band and stow it on a shelf.

Soon I was spending every lunchtime and free period around the Teletype with my fellow aficionados. Others might have found us eccentric, but I didn't care. I had discovered my calling. I was a programmer.

Notes - who is "William Stewart DOUGALL" ?

William Stewart Dougall, born on August 1, 1921, in Buffalo, New York, died peacefully on Saturday, November 21, 2009, surrounded by family. Bill was a pilot, aeronautical engineer, mountain climber and explorer, and math and physics teacher. After serving as a Navy pilot in World War II, he earned two undergraduate degrees from the University of Michigan in Math and Aeronautical Engineer ing, a Master of Education from Temple University and **a Master of Science and Aeronautical Engineering from the University of Washington**. He also received a degree in Contemporary French Literature from the Sorbonne in Paris, France. After working as an engineer at Boeing, Bill dis covered teaching, which became the joy of his life. He taught math and science at Lakeside School in Seattle from 1957 to 1995, and served as Socratic Mentor to Lakeside faculty from 1996 until the present, faithfully attending assembly every Wednesday. Dur ing his career he was a mentor to thousands of students who attend ed Lakeside School. He set up the school's first com puter terminal in 1969, which helped launch the careers of two of his students, Bill Gates and Paul Allen. He also established the school's Outdoor Education program. Bill took numerous sab baticals with his family to teach in Australia, Chile, Kenya and Scotland, and to build a windmill in Kathmandu, Nepal. Bill, along with his wife Lucy, was honored in 2006 by Lakeside School's es tablishment of The Bill and Lucy Dougall Fund for Inspirational Teaching. Bill was an avid traveler and out doorsman who led groups on ad ventures throughout the Pacific Northwest. He climbed moun tains on every continent including Aconcagua, Kilimanjaro, Blanc, Ararat, and McKinley. He volun teered for many years with the Mountain Rescue Council of Seat tle, and served on the Board of REI. Bill was an inspirational leader, best known for his intellectual cu riosity, his adventurous spirit, for insisting that we all get out, get muddy, and in spite of the perils, real or perceived, venture to places we never imagined we could go. After surviving a heart attack while running the Bay to Breakers Race in San Francisco at age 73, Bill devoted his later years to family and his farm in Woodinville, while continuing to substitute teach at Lakeside. On his eighty-eight birthday, he danced on the table with his grandchildren. Three weeks be fore his death, Bill Dougall spent the day bailing water from a leaky boat and mowing the lawn. He will be deeply missed. Bill is survived by his wife of 62 years, Lucy, their children: Lucy, Rob, Jonathan, Jill, and Sorrel; seven grandchildren , Jessica, Nick, Brighton, Linnet, Rowan, Callie and Nate, one great-grandchild, William and another on the way.

Notes - The GE-600 series

The **GE-600 series** was a family of 36-bit mainframe computers originating in the 1960s, built by General Electric (GE). When GE left the mainframe business the line was sold to Honeywell, which built similar systems into the 1990s as the division moved to Groupe Bull and then NEC.

The system is perhaps best known as the platform on which the Dartmouth Time Sharing System (DTSS) spent most of its life, and the base machine for the Multics operating system as well. Multics was supported by virtual memory additions made to later versions of the series.

1967/68 - Bill Gates first access to a computer is at age 12

Source - Interview: Bill Gates, Co-Founder and Chairman, Microsoft Corporation - March 17, 2010, Seattle, Washington - Source - [HW003P][GDrive]

When you were growing up, did you have any vision of what you wanted to accomplish?

Bill Gates: When I was very young I hadn't been exposed to computers so I was mostly just reading, doing math, learning about science, and I wasn't sure what my career would be. I knew I loved learning about things. I was an avid reader, but it was when I was 12 years old that I first got to use a computer, actually a very limited machine by today's standards. But that definitely fascinated me when I was first exposed.

Love at first sight?

Bill Gates: I was intrigued by figuring out what it could do and what it couldn't do. And some friends and I spent lots of time. The teachers got intimidated so we were on our own trying to figure it out. Actually, we gave a course on computers to the other students, and it became a fascination, where we got paid for doing computer work and talked about forming a company. But there was kind of a magical breakthrough when the computer became cheap, and we could see that everyone could afford a computer. That was much later, but that's what got us to really get together and create a company for software.

1968 (Fall) - Paul Allen meets Bill Gates

Source - MAY 2011 article in Vanity Fair - By Paul Allen - MICROSOFT'S ODD COUPLE / THE TECH REVOLUTION - [HP0030][GDrive]

In the words of narrator Paul Allen:

> *[...] One day early that fall [of 1968], I saw a gangly, freckle-faced eighth-grader edging his way into the crowd around the Teletype, all arms and legs and nervous energy. He had a scruffy-preppy look: pullover sweater, tan slacks, enormous saddle shoes. His blond hair went all over the place. You could tell three things about Bill Gates pretty quickly. He was really smart. He was really competitive; he wanted to show you how smart he was. And he was really, really persistent. After that first time, he kept coming back. Many times he and I would be the only ones there.*
>
> *Bill came from a family that was prominent even by Lakeside standards; his father later served as president of the state bar association. I remember the first time I went to Bill's big house, a block or so above Lake Washington, feeling a little awed. His parents subscribed to Fortune, and Bill read it religiously. One day he showed me the magazine's special annual issue and asked me, "What do you think it's like to run a Fortune 500 company?" I said I had no idea. And Bill said, "Maybe we'll have our own company someday." He was 13 years old and already a budding entrepreneur.*
>
> *Where I was curious to study everything in sight, Bill would focus on one task at a time with total discipline. You could see it when he programmed—he'd sit with a marker clenched in his mouth, tapping his feet and rocking, impervious to distraction. He had a unique way of typing, sort of a six-finger, sideways scrabble. There's a famous photograph of Bill and me in the computer room not long after we first met. I'm seated on a hard-back chair at the teleprinter in my dapper green corduroy jacket and turtleneck. Bill is standing to my side in a plaid shirt, his head cocked attentively, eyes trained on the printer as I type. He looks even younger than he actually was. I look like an older brother, which was something Bill didn't have.*

1968/69 School year - "at the age of thirteen , Bill Gates started programming ."

Source - Personal Computer Book Paperback – April 1, 1990 - by Peter McWilliams (Author) / Chatper 6 - At [HB004B][GDrive]

1969 - 1970 - CCC / Lakeside

Source : **AstrumPeople** article - Source PDF - [HW003M][GDrive]

[...] In 1969, at the Computer Center Corporation experienced difficulties once again, and in 1970, it declared itself a bankrupt. The Lakeside's students lost their job and access to computer time. **Paul Allen's father was working at the University of Washington and had an access to the computer center.** Young programmers got down to business looking for an area where to apply their knowledge. In 1971, the Information Sciences hired Bill Gates and Paul Allen to create software that would be make-up payroll sheet. In addition to unlimited computer time employers have agreed to pay the developers every time their software will bring the company profit.

Traf-o-Data - The young programmers regularly received orders. Bill Gates was the initiator who said: *"Let's call the real world, and sell it something."* And the most interesting thing that he did find clients and sold them his software. For example, once he developed software to optimize road traffic and sold it for $20,000 dollars. He was only 15 years old!

1970 (Sep) - Senior year at Lakeside for Paul Allen - In November, jobs at "ISI" for a payroll project start

Source: "The Idea man" by Paul Allen - [HB0049][GDrive]

OK - What kind of a company callus up

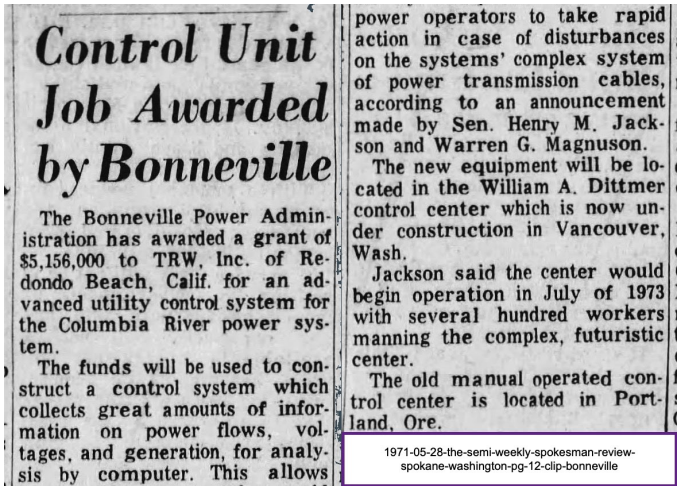
In the words of narrator Paul Allen:

> *One evening after school, early in my senior year at Lakeside, [which would be the fall of 1970,] I brazenly walked through a door and into UW's graduate computer science lab. I picked up a manual and took my seat at a Teletype linked to a Xerox Data Systems Sigma- 5, which I soon had figured out. Then a grad student approached to ask a question, and word got around that I seemed to know what I was doing. I was rolling along until an assistant professor called me into his office and said, "You don't look familiar. Are you in any of my classes?"*
>
> *And I said, "No, sir, I'm not."*
>
> *"As matter of fact, you're not even enrolled here, are you?" I confessed that I wasn't. The professor smiled and said, "All right,*
>
> *I'll tell you what. If you keep helping my students, you can stick around."*
>
> *There was no turning back after that. I moved on to the Burroughs B5500 and a powerful language called ALGOL— my first brush with batch processing, a step backward in time that only deepened my appreciation of the PDP-10. I tried my hand at a Control Data CDC- 6400 and an Imlac PDS- 1, the pioneering graphical minicomputer, where I found a version of Steve Russell's Spacewar. I was a sponge, soaking up knowledge wherever I could. All of us were sponges then.*
>
> *That November [of 1970], a Portland time- sharing company called Information Services Inc. invited me and my three "colleagues" to meet to discuss a contract, a big step for us. Before driving to Oregon, we reconstituted ourselves as the Lakeside Programming Group, which sounded grown- up and official.* ***ISI wanted a payroll program that had to be written in COBOL, a high- level language used in business applications.*** *In return,* ***they would credit us with free time on their PDP- 10****. We outlined our experience and submitted our résumés; Bill, just turned sixteen, had written his in pencil on lined notebook paper. We got the job.*

1971 (June) - Paul Allen graduates from Lakeside @

1971 (May 28) - TRW awarded contract for Bonneville Dam / Power @

- Ultimately, this is the project that Bill Gates will work on with Paul Allen in 1973.
- Bill Gates' Father William Henry Gates II (born 1925). is friends with all of the senators involved, as well as the Washington State governor Daniel Jackson Evans (born 1925) .
- Full page - [HN00Z2][GDrive]



Control Unit Job Awarded by Bonneville

The Bonneville Power Administration has awarded a grant of $5,156,000 to TRW, Inc. of Redondo Beach, Calif. for an advanced utility control system for the Columbia River power system.

The funds will be used to construct a control system which collects great amounts of information on power flows, voltages, and generation, for analysis by computer. This allows power operators to take rapid action in case of disturbances on the systems' complex system of power transmission cables, according to an announcement made by Sen. Henry M. Jackson and Warren G. Magnuson.

The new equipment will be located in the William A. Dittmer control center which is now under construction in Vancouver, Wash.

Jackson said the center would begin operation in July of 1973 with several hundred workers manning the complex, futuristic center.

The old manual operated control center is located in Portland, Ore.

1971 (Sep) - Paul Allen starts as freshman at Washington State, studying Computer Science

1971 (est)- For a period of about a year, Bill Gates Does NOT work with computers

We dont know exactly when this period was ...

Source : See [HW003M][GDrive] :

"Bill Gates' parents were extremely frightened of the enthusiasm of their son and by a willful decision they banned him from computer projects. For a year, Bill did not approach the object of his passion, reading the biographies of famous people from Napoleon to Roosevelt. "

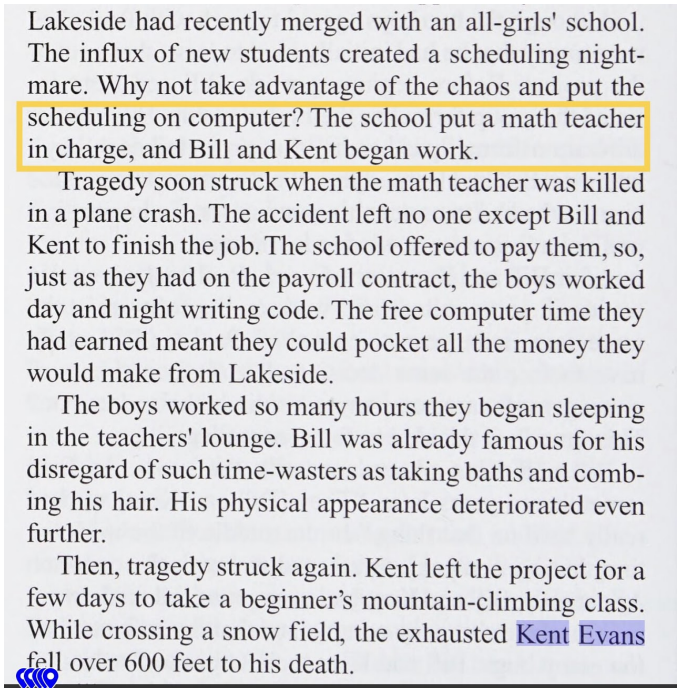
1972 (Jan) - School schedule programming project begins at Lakeside School (with Kent Evans)

Source : Wikipedia - Saved Aug 10 2020 / [HK002A][GDrive]

Note that the 1971-1972 school year is the junior year for Bill Gates; he and Kent Evants wanted the project done for Bill Gate's senior year - 1972-1973

Note below that the math teacher who was initially put in charge of this project died in a small plane crash.

The following year[, which would be 1971], a Lakeside teacher enlisted Gates and Evans to automate the school's class-scheduling system, providing them computer time and royalties in return. **The duo worked diligently in order to have the program ready for their senior year.** Towards the end of their junior year, Evans was killed in a mountain climbing accident, which Gates has described as one of the saddest days of his life. Gates then turned to Allen who helped him finish the system for Lakeside.



Lakeside had recently merged with an all-girls' school. The influx of new students created a scheduling nightmare. Why not take advantage of the chaos and put the scheduling on computer? The school put a math teacher in charge, and Bill and Kent began work.

Tragedy soon struck when the math teacher was killed in a plane crash. The accident left no one except Bill and Kent to finish the job. The school offered to pay them, so, just as they had on the payroll contract, the boys worked day and night writing code. The free computer time they had earned meant they could pocket all the money they would make from Lakeside.

The boys worked so many hours they began sleeping in the teachers' lounge. Bill was already famous for his disregard of such time-wasters as taking baths and combing his hair. His physical appearance deteriorated even further.

Then, tragedy struck again. Kent left the project for a few days to take a beginner's mountain-climbing class. While crossing a snow field, the exhausted Kent Evans fell over 600 feet to his death.

1972 (Sep) - Bill Gates begins senior year at Lakeside

1972 (Dec / Christmas) - Offer received to work with TRW / Bonneville @

Source: "The Idea man" by Paul Allen - [HB0049][GDrive]

In the words of narrator Paul Allen:

*"OVER CHRISTMAS, Bill [Gates] got a call from **Bud Pembroke**, the guy who'd hired us to do the ISI payroll program. A massive software project for the Bonneville Power Administration's electrical grid was behind schedule, and Bud was scouring the region for programmers who knew their way around a PDP- 10. I was not quite twenty and Bill was only seventeen, but age was not a criterion. "And you're going to be on salary," Bud said.*

Bill said, "How much?"

And Bud said, "One hundred sixty- five dollars a week."

Four dollars an hour was a pittance for an experienced programmer, even then, but Bill and I couldn't believe our good fortune. Here was a chance to work together again on a PDP- 10, and for pay! I was glad to take a leave of absence from Washington State. Bill had completed his required courses at Lakeside and got approval to pursue an off-campus senior project for his final semester. We told Bud to count us in.

Bill and I piled into his orange 1967 Mustang convertible and drove south to Vancouver, Washington, a land of strip malls, car washes, and a vintage A&W Root Beer drive- in stand where we'd become regulars. We found a cheap two- bedroom apartment and showed up for work on a Monday in January 1973.

1973 (Jan) - Bill Gates starts project with TRW / electric grid / Bonneville Power @

Good money! See [HW003M][GDrive] :

"By the age of seventeen Gates received a proposal for writing a software package for Bonneville Dam, which his parents didn't reject. For a one-year work on this project Gates received $30,000 dollars."

Source - Interview: Bill Gates, Co-Founder and Chairman, Microsoft Corporation - March 17, 2010, Seattle, Washington Source - [HW003P][GDrive]

Bill Gates: *My parents had been fantastic throughout my whole student career.* ***[...] That my senior year at Lakeside, where I had wanted to take time off and do this job at TRW, they'd been very supportive of that, letting me live down in Vancouver, Washington. I challenged them a little bit when some of my coworkers at TRW said I should skip undergraduate and just go to graduate school, and they were not enthused about that. It looked like I would have an opportunity to do that, but I didn't, I just went to Harvard.***

1973 (September) - Bill Gates starts starts at Harvard @

In the fall of 1973 Allen returned to University [, that being Washington State,] and Gates entered Harvard University .

" enrolled at Harvard College in the autumn of 1973. He chose a pre-law major but took mathematics and graduate level computer science courses. While at Harvard, he met fellow student Steve Ballmer. [Ballmer] graduated magna cum laude. Years later, Ballmer succeeded Gates as Microsoft's CEO and maintained that position from 2000 until his resignation in 2014." (Wikipedia - Saved Aug 10 2020 : [HK002A][GDrive])

1974 (mid or late year) - Bill Gates as sophomore at Harvard - Gates solves "pancake problem" in his sophomore year at Harvard

Wikipedia - Saved Aug 10 2020 [HK002A][GDrive]

(note - I think it involved the help of Harvard professior https://en.wikipedia.org/wiki/Harry_R._Lewis)

Gates devised an algorithm for pancake sorting as a solution to one of a series of unsolved problems [see https://www.npr.org/templates/story/story.php?storyId=92236781]) presented in a combinatorics class by professor Harry Lewis. His solution held the record as the fastest version for over 30 years, and its successor is faster by only 2%.[44][45] His solution was formalized and published in collaboration with Harvard computer scientist Christos Papadimitriou.[46]

1973/1974 - Bill Gates as sophomore at Harvard - Meets Ballmer

Source - 2000 (Dec 31) - Washington Post - "Alter Egos" By Mark Leibovich (Fourth in a series) Source - [HN00Z4][GDrive]

[Bill Gates] lived in Currier House, an outpost full of math and science whizzes removed from the more centrally located dorms along the Charles River. In his sophomore year, dormmate Jeff Clark introduced him to Ballmer, who was also living in Currier House. "Jeff liked Steve because Steve had this very energetic approach to being involved in everything," Gates says. "And he kind of liked me because I had this very energetic approach to not being involved in things."

Ballmer compensated for his shyness by becoming hyperactive on campus. He would become manager of the Harvard football team, business manager of the Harvard Crimson and publisher of a campus literary magazine. He made a point of memorizing faces and names from the Harvard directory.

He and Gates became friends, attending a double feature of "Singin' in the Rain" and "A Clockwork Orange" that November. The next month, Gates left the door to his dorm room wide open after he returned to Seattle for the holidays; because dormmates hung out in Gates's room, he never locked the door. Ballmer, seeing his friend's wallet sitting in full view on his dresser, locked up after him.

Both got perfect scores on their math SATs and shared an interest in Napoleon. They were both slobs, dormmates recall. Gates eschewed sheets, opting to sleep directly on his mattress because it was too much trouble to make his bed. Gary Kollin, who briefly shared an apartment with Ballmer one summer, says Ballmer did the same -- his sheets were the wrong size for his mattress, and he thought it would be a waste of money to buy new ones for the summer.

Ballmer helped nudge Gates into doing social things, persuading him to join Harvard's all-male Fox Club. But each had his own interests and circles: Ballmer had his extracurriculars; Gates spent hours playing poker with dormmates. The poker games went all night, and often badly for Gates.

"We used to rub our hands together when he'd sit down," poker player Scott Drill says. "We'd say, 'Here comes the Bill Gates Gravy Train.' " Gates had an obsessive willingness to keep playing, even after his losses reached into the hundreds. One night, he walked into Ballmer's room and handed him his checkbook. "Hide this," he said to Ballmer, one poker player recalls. "I don't want to lose anymore."

Neither required much sleep, and friends recall them engaging in animated debates late into the night. Ballmer even adopted Gates's rocking habit, seemingly unconsciously. Together they studied until dawn several days in a row for an economics final. "We're screwed in this class . . . no, we're golden," Ballmer would yell late at night, according to other students. Gates scored a 99 on the test, Ballmer a 97.

1974 (Summer?) - Paul Allen leaves Washington State, moves to Massachusetts to work at Honeywell, and spend time with Bill Gates on the weekends - Bill Gates claims he helped Paul Allen get that job

In the words of Paul Allen - from [HP0030][GDrive]

- He got a job offer just from a resume? What about going in for an interview?

Through the spring semester of 1974, Bill kept urging me to move to Boston. *We could find work together as programmers, he said; some local firms sounded interested. We'd come up with some exciting project. In any case, we'd have fun. Why not give it a try?*

Drifting at Washington State, I was ready to take a flier. I mailed my résumé to a dozen computer companies in the Boston area and got a $12,500 job offer from Honeywell. If Boston didn't work out, I could always return to school. In the meantime, I'd sample a new part of the country, and my girlfriend, Rita, had agreed to join me. We had grown more serious and wanted to live together as a trial run for marriage. Plus, Bill would be there. At a minimum, we could put our heads together on the weekends.

Source - Interview: Bill Gates, Co-Founder and Chairman, Microsoft Corporation - March 17, 2010, Seattle, Washington - Source - [HW003P][GDrive]

Bill Gates : *"In the meantime[, upon graduating High school and then starting at college,] I start at Harvard University back in Cambridge, Massachusetts. Paul's at Washington State, another place, s**o I help him get a job out there in the Boston area,** and we're just brainstorming, you know, "What's going to happen with the microprocessor?""*

Education

Currently enrolled for first year at Harvard College. Courses taken include: Operating Systems Structure, Data Base Management, Compiler Construction and Computer Graphics. Honors student and received A's in all of the above.

Experience: PDP-10, PDP-8, PDP-11, PDP-1, CDC-6400, Burroughs B-5500, Nova 1200, MCS-8008. Languages used include FORTRAN, COBOL, ALGOL, BASIC, LISP, JOSS and machine languages for most of the above computers.

TRW Systems Group, Vancouver, Washington 1/8/73-9/3/73

Systems programmer incolved with file design and modifications to Operating System, System library, and Utilities (flow-charting, coding, dubugging and documentation). The project involved setting up a real-time system for power control around two large PDP-10's and three PDP-11's.

In partnership with Paul G. Allen 6/2/72 - present

Designed and put together a system for traffic engineers to study traffic flow. The system is built around Intel's MCS-8008 microcomputer. The software and hardware setup has

5' 11" 185 lbs Age: 21
Unmarried
U.S. Citizen
Salary: $15,000
Desired Salary: open
Location: anywhere
Available: 6/1/74

Objective: Systems Analyst or Systems Programmer

Education

Currently a Junior at Washington State University in computer science. Courses taken include: Data Structures, Survey of Programming languages, Numerical Analysis, etc. Special projects on an APL interpreter and on the development of a Microcomputer Microprogrammed Multiprocessor.

Experience:

Working familiarity with the following machines: PDP-10, -11, -8, CDC-6400, Burroughs B-5500, XDS Sigma 5, IBM 360/67, Nova 1200, and Interdata models 3,4. Languages used include: FORTRAN, COBOL, ALGOL, BASIC, PL/I, SNOBOL, LISP, GPSS, APL, JOSS. Machine language programming on all of above computers with exception of B-5500. Extensive operating system experience with PDP-10 monitor, OS/MVT, and XDS RBM/BPM.

TRW Systems Group, Vancouver, Washington 1/22/73-8/15/73

Systems programmer responsible for design, coding test and modification of Recovery module of operating system. This involved supervision of two other systems programmers. The project was a real-time power control system for Bonneville Power. Hardware was Two large PDP-10's and three PDP-11's.

In partnership with William H. Gates 6/2/72 - present

Designed and managed development of a system for traffic engineers to use in the study of traffic flow. The system is built around Intel's MCS-8008 microcomputer. Developed a simulator on a PDP-10 which allowed simultaneous work on hardware and software. System now complete and tested. Demonstrations to customers planned for May 1974.

On contract to Lakeside School, Seattle, Washington 6/1/71-9/10/71 & 6/1/72-9/10/73

[HM000K][GDrive]

[...] A glimpse of his resume from 1974, when he was 18, reveals that during his first year at Harvard, Gates was already making $15,000.

In today's dollars, that's almost $75,000, according to the U.S. Bureau of Labor Statistics' inflation calculator. Impressive for a college freshman.

Though it's not clear from where that income came, the resume says that he and future Microsoft co-founder Paul Allen (today worth more than $20 billion) were working "in partnership" and had designed a program for an early Intel computer.

The CV also shows Gates worked as a programmer at TRW Systems Group in Vancouver, a developer of military and civil space systems (which was acquired by Northrop Grumman in 2002).

Both Gates and Allen structured their early resumes similarly. First, they listed computer-related coursework — where Gates points out he received all As in the courses mentioned, like Operating Systems Structure, Data Base Management and Computer Graphics. Next came the computer programming languages in which they were proficient. Finally, came work experience. [...]

1974 (October) - MITS completes the prototype of Altair - It is sent in the mail to New York City, but is lost in transit due to a strike

Source - Aug 14 2020 saved wikipedia - [HK002F][GDrive]

Art Salsberg, editorial director of *Popular Electronics*, was looking for a computer construction project, and his technical editor Les Solomon knew that MITS was working on an Intel 8080-based computer kit. Roberts assured Solomon that the project would be complete by November to meet the press deadline for the January 1975 issue. The first prototype was finished in October and shipped to *Popular Electronics* in New York for the cover photograph, but it was lost in transit. Solomon already had a number of pictures of the machine, and the article was based on them. Roberts and Yates got to work on building a replacement. The computer on the magazine cover was an empty box with just switches and LEDs on the front panel. The finished Altair computer had a completely different circuit board layout than the prototype shown in the magazine.[26]

1974 (December) - The January 1975 issue of Popular Electronics is now available, featuring the MITS Altair 8800 on the cover - and Paul Allen gets a copy at a news stand

Also see - MITS Inc. Altair 8800 .

Source : Interview: Bill Gates, Co-Founder and Chairman, Microsoft Corporation - March 17, 2010, Seattle, Washington (Source - [HW003P][GDrive])

Bill Gates: In 1971, there's this obscure article on the microprocessor that Intel has done -- what was called the 4004 -- that Paul said, "Look, this thing's going to keep getting better and it's going to be better than these mini-computers." Mini-computers were like $10,000 to $200,000. Paul and I had borrowed some of those and messed around with those. And Paul said, "No, no. They're going to have something better than the mini-computer that costs like $1,000." [...]

Finally, somebody takes the 8080 chip and creates a kit computer, and [the cover **story in Popular Electronics in January 1975 is theAltair 8800?]** that comes out in December 1974. So we get that, and that's both exciting -- because finally this thing that we've expected has happened -- but the question is, "Is it happening without us?" And so this company, which is in Albuquerque, New Mexico, we call them up and say, "Hey, we can do software for this machine." And they say, "Oh yeah, sure." So we very quickly work on a BASIC for this computer, which I'm well equipped to do, and Paul had some brilliant ideas about how we'd simulate this machine, because we didn't have one, and that was amazing. So we write this thing and we call them up and we say, "Hey, when you connect a teletype up, what's the software programming to get the characters in to print them? How do you do that?" The so-called "input output." **And they thought, "Well, that's interesting. You guys may not be flaky, because actually you're the first one who asked that question,"** which is, if you're going to really write the software, you eventually have to ask that question.

1974 (end of December) or 1975 (Jan 2) - "writing" from Bill Gates to MITS, offering MITS BASIC; then follow-up phone calls

Saved wikipedia (Aug 2020) - [HK002D][GDrive]

Ed Roberts (founder of MITS, Inc.) **received a letter** from Traf-O-Data (see https://en.wikipedia.org/wiki/Traf-O-Data) asking if he would be interested in buying its BASIC programming language for the machine. **He called the company and reached a private home, where no one had heard of anything like BASIC. In fact the letter had been sent by Bill Gates and Paul Allen from the Boston area, and they had no BASIC yet to offer.** When they **called Roberts to follow up** on the letter he expressed his interest, and the two started work on their **BASIC interpreter using a self-made simulator for the 8080 on a PDP-10 minicomputer.** They figured they had 30 days before someone else beat them to the punch, [...]

1974 (Jan / Feb) - Developing Altair BASIC demo, In Paul Allen's words

Source : MAY 2011 article in Vanity Fair - By Paul Allen - MICROSOFT'S ODD COUPLE / THE TECH REVOLUTION - [HP0030][GDrive]

In the words of narrator Paul Allen:

> ***So when the right opportunity surfaced, as it did that December, it got my full attention: an open invitation by the MITS company, in Albuquerque, to build a programming language for their new Altair microcomputer, intended for the hobbyist market.***
>
> ***Some have suggested that our Altair basic was remarkable because we created it without ever seeing an Altair or even a sample Intel 8080, the microprocessor it would run on. What we did was unprecedented, but what is less well understood is that we had no choice. The Altair was little more than a bare-bones box with a C.P.U.-on-a-chip inside. It had no hard drive, no floppy disk, no place to edit or store programs.***
>
> ***We moved into Harvard's Aiken Computation Lab, on Oxford Street, a one-story concrete building with an under-utilized time-sharing system. The clock was ticking on us from the start. Bill had told Ed Roberts, MITS'S co-founder and C.E.O., that our BASIC was nearly complete, and Ed said he'd like to see it in a month or so, when in point of fact we didn't even have an 8080 instruction manual.***
>
> ***In building our homegrown basic, we borrowed bits and pieces of our design from previous versions, a long-standing software tradition****. Languages evolve; ideas blend together; in computer technology, we all stand on others' shoulders. As the weeks passed, we got immersed in the mission—as far as we knew, we were building the first native high-level programming language for a microprocessor. Occasionally we wondered if some group at M.I.T. or Stanford might beat us, but we'd quickly regain focus. Could we pull it off? Could we finish this thing and close the deal in Albuquerque? Yeah, we could! We had the energy and the skill, and we were hell-bent on seizing the opportunity.*
>
> *We worked till all hours, with double shifts on weekends. Bill basically stopped going to class. Monte Davidoff, a Harvard freshman studying advanced math who had joined us, overslept his one-o'clock French section.* ***I neglected my job at Honeywell, dragging into the office at noon. I'd stay until 5:30, and then it was back to Aiken until three or so in the morning.*** *I'd save my files, crash for five or six hours, and start over. We'd break for dinner at Harvard House of Pizza or get the pupu platter at Aku Aku, a local version of Trader Vic's. I had a weakness for their egg rolls and butterflied shrimp.*
>
> *I'd occasionally catch Bill grabbing naps at his terminal during our late-nighters. He'd be in the middle of a line of code when he'd gradually tilt forward until his nose touched the keyboard. After dozing for an hour or two, he'd open his eyes, squint at the screen, blink twice, and resume precisely where he'd left off—a prodigious feat of concentration.*
>
> *Working so closely together, the three of us developed a strong camaraderie. Because our program ran on top of the multi-user TOPS-10 operating system, we could all work simultaneously. We staged nightly competitions to squeeze a sub-routine—a small portion of code within a program that performs a specific task—into the fewest instructions, taking notepads to separate corners of the room and scrawling away. Then someone would say, "I can do it in nine." And someone else would call out, "Well, I can do it in five!"*
>
> *A few years ago, when I reminisced with Monte about those days, he compared programming to writing a novel—a good analogy, I thought, for our approach to Altair BASIC. At the beginning we outlined our plot, the conceptual phase of the coding. Then we took the big problem and carved it into its component chapters, from the hundreds of sub-routines to their related data structures, before putting all the parts back together.*

1975 (Jan, early) - Recruited Monte Davidoff

Source - 2000, Washington Post - "Alter Egos" By Mark Leibovich (Fourth in a series) ; Source - [HN00Z4][GDrive]

In their rush to write BASIC for the Altair, Gates and Allen enlisted a quiet dormmate named Monte Davidoff to write an intricate but crucial part of the software. Davidoff was a shy, middle-class kid from Glendale, Wis. "Sweet, unassuming, really quiet guy," recalls Gary Kollin. By character and circumstance, an unequal partner with Gates.

Davidoff's job was to write a portion of the software that would allow the Altair to perform a greater range of calculations. In Albuquerque, he lived with Gates and Allen in a two-bedroom apartment, sleeping on the living room floor. They became friends, Davidoff says, but Gates rode him hard. "There was definitely a supervisory dynamic," Davidoff says. **"Bill could get very loud. If he felt you weren't getting something, he would say the same thing, louder. . . . He liked strong interchanges. I preferred not to work in that way."**

Davidoff spent the summers of 1975 and 1977 working for Gates and Allen. They offered him a permanent job with Micro-Soft. Davidoff, whose father co-owned a small Milwaukee hardware store, said no, chiefly because he didn't want to drop out of Harvard. Gates, with family money in reserve, could afford to.

"The way Bill and I thought about money was very different," Davidoff says. "He would tell all of his friends, 'Just call me collect.' He knew he wasn't going to have to support himself coming out of college."

Davidoff graduated from Harvard and went on to a career as a programmer. Now 44, he lives in Cupertino, Calif., where he works as an independent software consultant and pays the astronomical rents of Silicon Valley. He often wonders "what if," but says he's comfortable with his limited role in Microsoft's pre-corporate history.

He has not seen Gates for 23 years, except for two random encounters at industry events in San Jose.

1975 (February - late) - Interpreter development for demo is completed !

Initial work may have completed in mid-february .... "By mid-February 1975 the BASIC was running on the 8080 simulator. They arranged to take the BASIC to New Mexico for a demonstration. It had never run on the Altair or any 8080 chip yet - just on the simulator running on Harvard's PDP-10!" (https://legacy.voteview.com/gates.htm)

Below - MAY 2011 article in Vanity Fair - By Paul Allen - MICROSOFT'S ODD COUPLE / THE TECH REVOLUTION (see [HP0030][GDrive])

In the words of narrator Paul Allen:

> ***By late February [of 1975], eight weeks after our first contact with MITS, the interpreter (which would save space by executing one snippet of code at a time) was done. Shoehorned into about 3,200 bytes, roughly 2,000 lines of code, it was one tight little BASIC—stripped down, for sure, but robust for its size. No one could have beaten the functionality and speed crammed into that tiny footprint of memory: "The best piece of work we ever did," as Bill told me recently. And it was a true collaboration. I'd estimate that 45 percent of the code was Bill's, 30 percent Monte's, and 25 percent mine, excluding my development tools.***

1991 (July 5) - Bill Gates meets Warren Buffett, introduced by parents

Bill Gates didn't want to attend the dinner where he met Warren Buffett—but his mom convinced him to go

CNBC : Published Fri, Oct 6 201712:37 PM EDTUpdated Fri, Oct 6 20174:42 PM EDT / Source - [HM000E][GDrive]

[...]

On July 5, 1991, Buffett was visiting Washington state when he was invited to dinner with Gates' parents via a mutual friend. The friend teased the possibility that Gates himself might show up, according to Buffett, who told students the story during an event with Gates at the University of Nebraska at Lincoln's College of Business Administration in 2005.

Meanwhile, Gates protested his invitation.

"It was a funny event because my mom's very sociable, always getting people together," Gates tells the students. "I at this time didn't believe in vacations, was totally focused on my job. So when she said to me, 'You've got to come out and meet Warren...,' I said, 'Mom, I'm busy!'"

Gates' mother pushed back, however, insisting that Buffett would be interesting and worth her son's time.

"I wasn't convinced," Gates writes in a blog post reflecting on the pair's friendship 25 years later. "'Look, he just buys and sells pieces of paper. That's not real value added. I don't think we'd have much in common,' I told her."

Eventually his mom convinced him to go. "I agreed to stay for no more than two hours before getting back to work at Microsoft," he writes.

But once Gates and Buffett finally got a chance to talk, things just clicked. Buffett pressed the tech mogul with difficult questions about Microsoft, and Gates welcomed the challenge. "These were amazingly good questions that nobody had ever asked," he writes.

Gates abandoned his plan to fly back to work that night. "We were suddenly lost in conversation and hours and hours slipped by. He didn't come across as a big shot investor. He had this modest way of talking about what he does. He was funny, but what impressed me most was how clearly he thought about the world."

After that night, the pair quickly became close. "It began a really unbelievable friendship for me and I could tell that even though we came from different directions, the kinds of things that fascinated us and that we thought were important were very much the same," says Gates, speaking to UNL students. Clips on Bill Gates meeting Buffett...

http://content.time.com/time/magazine/article/0,9171,1120657-10,00.html

1997-01-15-content-time-com-article-in-search-of-bill-gates-10-of-17.pdf

In that regard he is the opposite of, say, Bill Clinton, who brackets the other end of the baby boom: Gates analytically rigorous and emotionally reserved, the President equally smart but intellectually undisciplined and readily intimate. They played golf on Martha's Vineyard once, and the President, as usual, worked hard at bonding emotionally and being personally charming and intimate. He expressed sorrow about the death of Gates' mother, shared the pain of the recent death of his own mother and gave golfing tips to Melinda. But Gates noticed that Clinton never bore in or showed rigorous curiosity about technological issues. Though he vaguely considers himself a Democrat, Gates stayed neutral in the presidential election.

Warren Buffett, the Omaha, Nebraska, investor whom Gates demoted to being merely the second richest American, seems an unlikely person to be among his closest pals. A jovial, outgoing 66-year-old grandfather, Buffett only recently learned to use a computer. But as multibillionaires go, both are unpretentious, and they enjoy taking vacations together. Buffett's secretary apologetically explains that Buffett isn't giving interviews these days and at the moment is traveling, but she promises to pass along the request. Less than three hours later, Buffett calls to say he happens to be in the Time & Life Building with some free time between meetings in Manhattan, and he would be happy to come by to be interviewed. He likes to talk about Gates.

His favorite story is about the 1995 excursion to China that Bill and Melinda organized for seven couples. "For part of the trip we stayed on a ship in the Yangtze with five decks that normally accommodates hundreds of people," he says with the glee of a kid describing Walt Disney World. "Each evening Melinda arranged different activities." There was karaoke singing in the ship's ballroom, performances of quickie versions of Shakespeare plays, "and a trivia quiz on such things as how many meals we'd eaten, with prizes that Melinda and Bill handed out." When relaxed, Buffett says, Gates has a fun sense of humor. In the Forbidden City they were given a show of huge ancient scrolls that were silently rolled and unrolled by women trained for the task. "There's a $2 fine," Gates whispered, "if you return a scroll not rewound."

When Gates decided to propose to Melinda in 1993, he secretly diverted the chartered plane they were taking home from Palm Springs one Sunday night to land in Omaha. There Buffett met them, arranged to open a jewelry store that he owned and helped them pick a ring. That year Gates made a movie for Buffett's birthday. It featured Gates pretending to wander the country in search of tales about Buffett and calling Melinda with them from pay phones. After each call, Gates is shown checking the coin slot for loose change. When she mentions that Buffett is only the country's second richest man, he informs her that on the new Forbes list Buffett had (at least that one year) regained the top spot. The phone suddenly goes dead. "Melinda, Melinda," Gates sputters, "you still there? Hello?"

http://content.time.com/time/magazine/article/0,9171,1120657-10,00.html

1997-01-15-content-time-com-article-in-search-of-bill-gates-11-of-17.pfd

11 of 17

Last October Gates brought Melinda and their new daughter to visit Buffett and his wife in San Francisco. They ended up playing bridge for nine hours straight. Another marathon session in Seattle started in the morning and lasted--with a break for Melinda to pick up lunch at Burger King--until guests started arriving for dinner. "He loves games that involve problem solving," Buffett says. "I showed him a set of four dice with numbers arranged in a complex way so that any one of them would on average beat one of the others. He was one of three people I ever showed them to who figured this out and saw the way to win was to make me choose first which one I'd roll." (For math buffs: the dice were nontransitive. One of the others who figured it out was the logician Saul Kripke.)

Their relationship is not financial. Buffett, who does not invest in technology stocks, bought 100 shares of Microsoft just as a curiosity back when he met Gates ("I wish I'd bought more," he laughs), and Gates describes his investment with Buffett as "only" about $10 million ("I wish I'd invested more," he likewise jokes). But Gates shares Buffett's interest in the media world and even likes to joke that he has created a digital encyclopedia called Encarta that now outsells World Book, which is controlled by Buffett. So far Microsoft has mainly treated content as something that its software managers can create from scratch. But given the relative cheapness of some media stocks compared with that of Microsoft, Gates may someday look for some big acquisitions (he was in serious talks about taking a $2 billion stake in CNN before Time Warner merged with Turner Communications), and Buffett would be a useful partner.

Another of Gates' vacation companions is Ann Winblad, the software entrepreneur and venture capitalist he dated during the 1980s. They met in 1984 at a Ben Rosen-Esther Dyson computer conference and started going on "virtual dates" by driving to the same movie at the same time in different cities and discussing it on their cell phones. For a few years she even persuaded him to stop eating meat, an experiment he has since resolutely abandoned.

They were kindred minds as well as spirits. On a vacation to Brazil, he took James Watson's 1,100-page textbook, Molecular Biology of the Gene, and they studied bioengineering together. On another vacation, to a Santa Barbara, California, ranch, she took tapes of Richard Feynman's lectures at Cornell, and they studied physics. And on a larger excursion with friends to central Africa, which ended at some beach cottages on an island off Zanzibar, among their companions was anthropologist Donald Johanson, known for his work on the human ancestor Lucy, who helped teach them about human evolution. In the evenings on each trip they would go to the beach with four or five other couples for bonfires, Hood Canal-style games and a tradition they called the sing-down, where each team is given a word and has to come up with songs that feature it. Winblad remembers Gates disappearing on a dark beach after his group had been given the word sea, and then slowly emerging from the mist singing a high-pitched solo of Puff, the Magic Dragon.

Early life

Gates was born in Seattle, Washington, on October 28, 1955.[3] He is the son of William H. Gates Sr.[5] (b. 1925) and Mary Maxwell Gates (1929–1994).[19] His ancestry includes English, German, and Irish/Scots-Irish.[20] His father was a prominent lawyer, and his mother served on the board of directors for First Interstate BancSystem and the United Way of America. Gates's maternal grandfather was J. W. Maxwell, a national bank president. Gates has an older sister Kristi (Kristianne) and a younger sister Libby. He is the fourth of his name in his family but is known as William Gates III or "Trey" (i.e., three) because his father had the "II" suffix.[21][22] The family lived in the Sand Point area of Seattle in a home that was damaged by a rare tornado when Gates was seven years old.[23]

Early in his life, Gates observed that his parents wanted him to pursue a law career.[24] When he was young, his family regularly attended a church of the Congregational Christian Churches, a Protestant Reformed denomination.[25][26][27] Gates was small for his age and was bullied as a child.[22] [...]

When he was in the eighth grade, the Mothers' Club at the school used proceeds from Lakeside School's rummage sale to buy a Teletype Model 33 ASR terminal and a block of computer time on a General Electric (GE) computer for the students.[32] Gates took an interest in programming the GE system in BASIC, and he was excused from math classes to pursue his interest. He wrote his first computer program on this machine, an implementation of tic-tac-toe that allowed users to play games against the computer. Gates was fascinated by the machine and how it would always execute software code perfectly.[33] After the Mothers Club donation was exhausted, Gates and other students sought time on systems including DEC PDP minicomputers. One of these systems was a PDP-10 belonging to Computer Center Corporation (CCC) which banned for the summer Gates, Paul Allen, Ric Weiland, and Gates's best friend and first business partner Kent Evans, after it caught them exploiting bugs in the operating system to obtain free computer time.[34][22]

The four students formed the Lakeside Programmers Club to make money.[22] At the end of the ban, they offered to find bugs in CCC's software in exchange for extra computer time. Rather than use the system remotely via Teletype, Gates went to CCC's offices and studied source code for various programs that ran on the system, including Fortran, Lisp, and machine language. The arrangement with CCC continued until 1970 when the company went out of business.

BASIC

Gates read the January 1975 issue of *Popular Electronics* which demonstrated the Altair 8800, and he contacted Micro Instrumentation and Telemetry Systems (MITS) to inform them that he and others were working on a BASIC interpreter for the platform.[51] In reality, Gates and Allen did not have an Altair and had not written code for it; they merely wanted to gauge MITS's interest. MITS president Ed Roberts agreed to meet them for a demonstration, and over the course of a few weeks they developed an Altair emulator that ran on a minicomputer, and then the BASIC interpreter. The demonstration was held at MITS's offices in Albuquerque, New Mexico; it was a success and resulted in a deal with MITS to distribute the interpreter as Altair BASIC. MITS hired Allen,[52] and Gates took a leave of absence from Harvard to work with him at MITS in November 1975. Allen named their partnership "Micro-Soft", a combination of "microcomputer" and "software", and their first office was in Albuquerque. The first employee Gates and Allen hired was their high school collaborator Ric Weiland.[52] They dropped the hyphen within a year and officially registered the trade name "Microsoft" with the Secretary of the State of New Mexico on November 26, 1976.[52] Gates never returned to Harvard to complete his studies.

Microsoft's Altair BASIC was popular with computer hobbyists, but Gates discovered that a pre-market copy had leaked out and was being widely copied and distributed. In February 1976, he wrote an Open Letter to Hobbyists in the MITS newsletter in which he asserted that more than 90% of the users of Microsoft Altair BASIC had not paid Microsoft for it and the Altair "hobby market" was in danger of eliminating the incentive for any professional developers to produce, distribute, and maintain high-quality software.[53] This letter was unpopular with many computer hobbyists, but Gates persisted in his belief that software developers should be able to demand payment. Microsoft became independent of MITS in late 1976, and it continued to develop programming language software for various systems.[52] The company moved from Albuquerque to Bellevue, Washington on January 1, 1979.[51]

Gates said he personally reviewed and often rewrote every line of code that the company produced in its first five years. As the company grew he transitioned into a manager role, then an executive.[54]

IBM partnership

IBM, the leading supplier of computer equipment to commercial enterprises at the time, approached Microsoft in July 1980 concerning software for its upcoming personal computer, the IBM PC.[55] IBM first proposed that Microsoft write the BASIC interpreter. IBM's representatives also mentioned that they needed an operating system, and Gates referred them to Digital Research (DRI), makers of the widely used CP/M operating system.[56] IBM's discussions with Digital Research went poorly, however, and they did not reach a licensing agreement. IBM representative Jack Sams mentioned the licensing difficulties during a subsequent meeting with Gates and asked if Microsoft could provide an operating system. A few weeks later, Gates and Allen proposed using 86-DOS, an operating system similar to CP/M, that Tim Paterson of Seattle Computer Products (SCP) had made for hardware similar to the PC.[57] Microsoft made a deal with SCP to be the exclusive licensing agent of 86-DOS, and later the full owner. Microsoft employed Paterson to adapt the operating system for the PC[58] and delivered it to IBM as PC DOS for a one-time fee of $50,000.[59]

The contract itself only earned Microsoft a relatively small fee. It was the prestige brought to Microsoft by IBM's adoption of their operating system that would be the origin of Microsoft's transformation from a small business to the leading software company in the world. Gates had not offered to transfer the copyright on the operating system to IBM because he believed that other personal computer makers would clone IBM's PC hardware.[59] They did, making

the IBM-compatible PC, running DOS, a de facto standard. The sales of MS-DOS (the version of DOS sold to customers other than IBM) made Microsoft a major player in the industry.[60] The press quickly identified Microsoft as being very influential on the IBM PC. *PC Magazine* asked if Gates was "the man behind the machine?".[55]

Gates oversaw Microsoft's company restructuring on June 25, 1981, which re-incorporated the company in Washington state and made Gates the president and chairman of the board, with Paul Allen as vice president and vice chairman. In early 1983, Allen left the company after receiving a Hodgkin lymphoma diagnosis, effectively ending the formal business partnership between Gates and Allen, which had been strained months prior due to a contentious dispute over Microsoft equity.[51][61] Later in the decade, Gates repaired his relationship with Allen and together the two donated millions to their childhood school Lakeside.[22] They remained friends until Allen's death in October 2018.[62]

Management style

Gates delivers a speech at the World Economic Forum in Switzerland, January 2008

Gates had primary responsibility for Microsoft's product strategy from the company's founding in 1975 until 2006. He gained a reputation for being distant from others; an industry executive complained in 1981 that "Gates is notorious for not being reachable by phone and for not returning phone calls."[64] An Atari executive recalled that he showed Gates a game and defeated him 35 of 37 times. When they met again a month later, Gates "won or tied every game. He had studied the game until he solved it. That is a competitor".[65]

Gates met regularly with Microsoft's senior managers and program managers, and the managers described him as being verbally combative. He also berated them for perceived holes in their business strategies or proposals that placed the company's long-term interests at risk.[66][67] He interrupted presentations with such comments as "that's the stupidest thing I've ever heard"[68] and "why don't you just give up your options and join the Peace Corps?"[69] The target of his outburst would then have to defend the proposal in detail until Gates was fully convinced.[68] When subordinates appeared to be procrastinating, he was known to remark sarcastically, "I'll do it over the weekend."[70][71][72]

During Microsoft's early years, Gates was an active software developer, particularly in the company's programming language products, but his primary role in most of the company's history was as a manager and executive. He has not officially been on a development team since working on the TRS-80 Model 100,[73] but he wrote code that shipped with the company's products as late as 1989.[71] Jerry Pournelle wrote in 1985 when Gates announced Microsoft Excel: "Bill Gates likes the program, not because it's going to make him a lot of money (although I'm sure it will do that), but because it's a neat hack."[74]

On June 15, 2006, Gates announced that he would transition out of his role at Microsoft to dedicate more time to philanthropy. He divided his responsibilities between two successors when he placed Ray Ozzie in charge of management and Craig Mundie in charge of long-term product strategy.[75]

Antitrust litigation

Further information: United States Microsoft antitrust case and European Union Microsoft competition case

Gates giving his deposition at Microsoft on August 27, 1998

Gates approved of many decisions that led to antitrust litigation over Microsoft's business practices. In the 1998 *United States v. Microsoft* case, Gates gave deposition testimony that several journalists characterized as evasive. He argued with examiner David Boies over the contextual meaning of words such as "compete", "concerned", and "we". Later in the year, when portions of the videotaped deposition were played back in court, the judge was seen laughing and shaking his head.[76] *BusinessWeek* reported:

Early rounds of his deposition show him offering obfuscatory answers and saying "I don't recall" so many times that even the presiding judge had to chuckle. Worse, many of the technology chief's denials and pleas of ignorance were directly refuted by prosecutors with snippets of e-mail that Gates both sent and received.[77]

Gates later said that he had simply resisted attempts by Boies to mischaracterize his words and actions. "Did I fence with Boies? ... I plead guilty... rudeness to Boies in the first degree."[78] Despite Gates's denials, the judge ruled that Microsoft had committed monopolization, tying and blocking competition, each in violation of the Sherman Antitrust Act.[78]

Post-Microsoft

Since leaving day-to-day operations at Microsoft, Gates has continued his philanthropy and works on other projects.

According to the Bloomberg Billionaires Index, Gates was the world's highest-earning billionaire in 2013, as his net worth increased by US$15.8 billion to US$78.5 billion. As of January 2014, most of Gates's assets are held in Cascade Investment LLC, an entity through which he owns stakes in numerous businesses, including Four Seasons Hotels and Resorts, and Corbis Corp.[79] On February 4, 2014, Gates stepped down as chairman of Microsoft to become "technology advisor" alongside CEO Satya Nadella.[11][80]

Gates provided his perspective on a range of issues in a substantial interview that was published in the March 27, 2014 issue of *Rolling Stone* magazine. In the interview, Gates provided his perspective on climate change, his charitable activities, various tech companies and people involved in them, and the state of America. In response to a question about his greatest fear when he looks 50 years into the future, Gates stated: "... there'll be some really bad things that'll happen in the next 50 or 100 years, but hopefully none of them on the scale of, say, a million people that you didn't expect to die from a pandemic, or nuclear or bioterrorism." Gates also identified innovation as the "real driver of progress" and pronounced that "America's way better today than it's ever been."[81]

Gates has expressed concern about the potential harms of superintelligence; in a Reddit "ask me anything", he stated that:

First the machines will do a lot of jobs for us and not be super intelligent. That should be positive if we manage it well. A few decades after that though the intelligence is strong enough to be a concern. I agree with Elon Musk and some others on this and don't understand why some people are not concerned.[82][83][84][85]

In an interview that was held at the TED conference in March 2015, with Baidu's CEO, Robin Li, Gates said he would "highly recommend" Nick Bostrom's recent work, *Superintelligence: Paths, Dangers, Strategies*.[86] During the conference, Gates warned that the world was not prepared for the next pandemic, a

situation that would come to pass in late 2019 when the COVID-19 pandemic began.[87] In March 2018, Gates met at his home in Seattle with Mohammed bin Salman, the reformist crown prince and de facto ruler of Saudi Arabia to discuss investment opportunities for Saudi Vision 2030.[88][89] In June 2019, Gates admitted that losing the mobile operating system race to Android was his biggest mistake. He stated that it was within their skill set of being the dominant player, but partially blames the antitrust litigation during the time.[90] That same year, Gates became an Advisory Board Member of the Bloomberg New Economy Forum.[91]

On March 13, 2020, Microsoft announced Gates would be leaving his board positions at Berkshire Hathaway and Microsoft to dedicate his efforts in philanthropic endeavors such as climate change, global health and development, and education.[92]

Recognition

Bill and Melinda Gates being awarded the Presidential Medal of Freedom by President Barack Obama in 2016.

- In 1987, Gates was listed as a billionaire in *Forbes* magazine's 400 Richest People in America issue. He was worth $1.25 billion and was the world's youngest self-made billionaire.[13] Since 1987, Gates has been included in the *Forbes* The World's Billionaires list and was the wealthiest from 1995 to 1996,[125] 1998 to 2007, 2009, and has been since 2014.[1] Gates was number one on the Forbes 400 list from 1993 through to 2007, 2009, and 2014 through 2017.[126][127]
- *Time* magazine named Gates one of the 100 people who most influenced the 20th century, as well as one of the 100 most influential people of 2004, 2005, and 2006.
- *Time* also collectively named Gates, his wife Melinda and U2's lead singer Bono as the 2005 Persons of the Year for their humanitarian efforts.[128] In 2006, he was voted eighth in the list of "Heroes of our time".[129]
- Gates was listed in the *Sunday Times* power list in 1999, named CEO of the year by *Chief Executive Officers magazine* in 1994, ranked number one in the "Top 50 Cyber Elite" by *Time* in 1998, ranked number two in the *Upside* Elite 100 in 1999, and was included in *The Guardian* as one of the "Top 100 influential people in media" in 2001.[130]
- Gates was elected Member of the US National Academy of Engineering in 1996 "for contributions to the founding and development of personal computing".[131]
- He was named Honorary Member of the American Library Association in 1998.[132]
- He was elected a foreign member of the Chinese Academy of Engineering in 2017.[133]
- According to *Forbes*, Gates was ranked as the fourth most powerful person in the world in 2012,[134] up from fifth in 2011.[135]
- In 1994, he was honored as the 20th Distinguished Fellow of the British Computer Society (DFBCS). In 1999, Gates received New York Institute of Technology's President's Medal.[136]
- Gates has received honorary doctorates from Nyenrode Business Universiteit (2003),[137] KTH Royal Institute of Technology (2002),[138] Waseda University (2005),[139] Tsinghua University (2007),[140] Harvard University (2007),[141] the Karolinska Institute (2007),[142] and Cambridge University (2009).[143]
- He was also made an honorary trustee of Peking University in 2007.[144]
- Gates was made an Honorary Knight Commander of the Order of the British Empire (KBE) by Queen Elizabeth II in 2005.[145]
- In November 2006, he was awarded the Placard of the Order of the Aztec Eagle, together with his wife Melinda who was awarded the Insignia of the same order, both for their philanthropic work around the world in the areas of health and education, particularly in Mexico, and specifically in the program "*Un país de lectores*".[146]
- Gates received the 2010 Bower Award for Business Leadership from The Franklin Institute for his achievements at Microsoft and his philanthropic work.[147]
- Also in 2010, he was honored with the Silver Buffalo Award by the Boy Scouts of America, its highest award for adults, for his service to youth.[148]
- In 2002, Bill and Melinda Gates received the Jefferson Award for Greatest Public Service Benefiting the Disadvantaged.[149]
- He was given the 2006 James C. Morgan Global Humanitarian Award from the Tech Awards.[150]
- In 2015 Gates, along with his wife Melinda, received the Padma Bhushan, India's third-highest civilian award for their social work in the country.[151][152]
- Barack Obama honored Bill and Melinda Gates with the Presidential Medal of Freedom for their philanthropic efforts in 2016,[153] and François Hollande awarded Bill and Melinda in the following year with France's highest national order – as Commander of the Legion of Honour for their charity efforts.[154]
- Entomologists named Bill Gates' flower fly, *Eristalis gatesi*, in his honor in 1997.[155]

Personal life

Gates and his wife, Melinda, 2009

Gates married Melinda French on a golf course on the Hawaiian island of Lanai on January 1, 1994. They have three children. The family resides in Xanadu 2.0, an earth-sheltered mansion in the side of a hill overlooking Lake Washington in Medina, Washington. In 2009, property taxes on the mansion were reported to be US$1.063 million, on a total assessed value of US$147.5 million.[156] The 66,000-square-foot (6,100 m^2) estate has a 60-foot (18 m) swimming pool with an underwater music system, as well as a 2,500-square-foot (230 m^2) gym and a 1,000-square-foot (93 m^2) dining room.[157]

In an interview with *Rolling Stone*, Gates stated in regard to his faith: "The moral systems of religion, I think, are super important. We've raised our kids in a religious way; they've gone to the Catholic church that Melinda goes to and I participate in. I've been very lucky, and therefore I owe it to try and reduce the inequity in the world. And that's kind of a religious belief. I mean, it's at least a moral belief."[158]

Gates also said: "I agree with people like Richard Dawkins that mankind felt the need for creation myths. Before we really began to understand disease and the weather and things like that, we sought false explanations for them. Now science has filled in some of the realm – not all – that religion used to fill. But the mystery and the beauty of the world is overwhelmingly amazing, and there's no scientific explanation of how it came about. To say that it was generated

by random numbers, that does seem, you know, sort of an uncharitable view [laughs]. I think it makes sense to believe in God, but exactly what decision in your life you make differently because of it, I don't know."[158]

Gates purchased the Codex Leicester, a collection of scientific writings by Leonardo da Vinci, for US$30.8 million at an auction in 1994.[159] Gates is an avid reader, and the ceiling of his large home library is engraved with a quotation from *The Great Gatsby*.[160] He also enjoys playing bridge, tennis, and golf.[161][162] Gates's days are planned for him on a minute-by-minute basis, similar to the U.S. President's schedule.[163] Despite his wealth and extensive business travel, Gates flew coach in commercial aircraft until 1997, when he bought a private jet.

In 1999, his wealth briefly surpassed US$101 billion.[164][165] Since 2000, the nominal value of his Microsoft holdings has declined due to a fall in Microsoft's stock price after the dot-com bubble burst and the multi-billion dollar donations he has made to his charitable foundations. In May 2006, Gates remarked that he wished that he were not the richest man in the world because he disliked the attention it brought.[166] In March 2010, Gates was the second wealthiest person behind Carlos Slim, but regained the top position in 2013, according to the Bloomberg Billionaires List.[167][168] Slim retook the position again in June 2014[169][170] (but then lost the top position back to Gates). Between 2009 and 2014, his wealth doubled from US$40 billion to more than US$82 billion.[171] In October 2017, Gates was surpassed by Amazon founder Jeff Bezos as the richest person in the world.[14] On November 15, 2019, he once again became the richest person in the world after a 48% increase in Microsoft shares, surpassing Bezos.[172] Gates told the BBC, "I've paid more tax than any individual ever, and gladly so ... I've paid over $6 billion in taxes."[173] He is a proponent of higher taxes, particularly for the rich.[174]

Gates has held the top spot on the list of *The World's Billionaires* for 18 out of the past 23 years.[175] Gates has several investments outside Microsoft, which in 2006 paid him a salary of US$616,667 and US$350,000 bonus totalling US$966,667.[176] In 1989, he founded Corbis, a digital imaging company. In 2004, he became a director of Berkshire Hathaway, the investment company headed by long-time friend Warren Buffett.[177]

In 2016, he revealed that he is color-blind.[178]

External business ventures and investments (partial list)

Gates has a multi-billion dollar investment portfolio with stake in various sectors[179] and has participated in several entrepreneurial ventures beyond Microsoft, including:

- AutoNation, automotive retailer that Gates has a 16% stake in trading on the NYSE.
- bgC3, a new think-tank company founded by Gates.
- Canadian National Railway (CN), a Canadian Class I freight railway. As of 2019, Bill Gates is the largest single shareholder of CN stock.[180]
- Cascade Investment LLC, a private investment and holding company incorporated in the United States, founded and controlled by Bill Gates and headquartered in Kirkland, Washington.
- Corbis (originally named Interactive Home Systems and now known as Branded Entertainment Network), a digital image licensing and rights services company founded by Gates.
- EarthNow, Seattle-based startup company aiming to blanket the Earth with live satellite video coverage. Gates is a large financial backer.
- Eclipse Aviation, a defunct manufacturer of very light jets. Gates was a major stake-holder early on in the project.
- Ecolab, global provider of water, hygiene and energy technologies and services to the food, energy, healthcare, industrial and hospitality markets. Gates increased his stake of 10.8% in Ecolab to 25% in 2012.
- ResearchGate, a social networking site for scientists. Gates participated in a $35 million round of financing along with other investors.[181]
- TerraPower, a nuclear reactor design company founded by Gates.

Book - Smart money : the Story of Bill Gates - Book clips sent via DM by "@AgentRevolt" to @HousatonicITS

Bill was never merely a hacker, though. His friendship with Kent Evans, and later with Paul Allen, had another common element besides their shared interest in computers. All three boys were also interested in making money.

By Bill's junior year at Lakeside, C-Cubed was out of business. The company's plans to make a fortune by

[HT008L][GDrive]

No one was quicker to learn new computer languages than Bill. Soon Bill and Kent were doing most of the work on the payroll project.

Although the two boys agreed to work with Paul, they were angry that he had initially tried to leave them out of the project. Before beginning work, Bill and Kent insisted the group formalize their relationship. Bill's father drew up a formal partnership that protected each boy's interests. Bill had learned from Paul's attempt to exclude him that he had to protect his own interests in business. It was not a lesson he needed to learn twice.

After Bill and Kent started work, Paul backed out. He could not go to college and work on the software at the same time. In the years to come both Paul and Bill would have to face the same decision: Pursue their dream of owning a software company or continue their education? This time Paul decided to focus on college.

[HT008N][GDrive]

Chapter Three

Teenage Programmer

After C-Cubed closed, Bill and his friends formed the Lakeside Programmers Group. The organization was dedicated to finding computer time and discovering a way for the teenagers to make some money. Paul Allen, who was by now in his freshman year at Washington State University, located a PDP-10 on campus. That was all it took to convince the boys to move their operations there. Although Paul was the only university student in the group, and Bill looked several years younger than his actual age, the professors responsible for the computers quickly learned that the boys were a valuable asset to have around.

Not long after the group was formed, another computer timesharing company, located in Portland, Oregon, asked Paul Allen to write a payroll program. Initially, Paul tried to write the program without the help of Bill and Kent Evans, but he was in over his head. A payroll program had many different modules, and demanded

[HT008M][GDrive]

machines reserved for graduate students. The director of the computer center remembered Gates well: "He was a helluva good programmer." "But," the professor continued, "he's an obnoxious human being." As had been the case at Lakeside, several people were offended by Bill's impatience and his tendency to put others down unnecessarily.

Establishment and Development of Microsoft

In June, 1975, Bill Gates creates a company for software development and names it Microsoft (the first version was Micro-Soft). Despite of the hard work of its employees, the company at first experienced some difficulties with distribution of any software products. **The company did not have enough money to hire a good sales manager, so this function was performed by Bill Gates' mother Mary Maxwell Gates.**

Early next year, Gates and Allen found out that the income of the company has dropped to the lowest affordable point. Its main reason was so called 'piracy' – illegal copying of software and the use of it without permission of the creator. Many people simply copied the MS-Basic and handed it to someone else. Realizing this, Bill Gates was furious, especially because 'piracy' was depriving him from the well-earned income. In addition, these copies contained some mistakes which he wanted to reduce before the formal release of MS-Basic. Gates wrote an open letter in February 1976, which was published in a newsletter for Altair users. In response, the Gates Foundation has received 300 letters, but only a few of them contained a check.

Bill Gates was the very first to state the need in a protection of the software. His actions have made an incredible contribution to the gradual introduction of a thought that a computer program is a product of creativity and therefore must be protected in the same way as a musical composition or a literary work.

[....]

In 1976, it became obvious that Bill Gates could not continue his studies and manage a growing company at the same time. In December, he left the university, despite of all the objections of his parents, and fully engaged with the business. At that time, he was only twenty one.

Then, the young businessmen got a lucky strike and the profit of Microsoft sales reached $500,000 dollars for the 1977 financial year. The company, based in Albuquerque, New Mexico, had a staff of 13 people. Paul Allen and Gates were engaged in organizational issues: Paul was responsible for the development of new software, and Bill communicated with the computer manufactures, and ran daily operations of the company

In 1979, Bill received an offer from IBM to create an operating system for the world's first personal computer. However, Bill Gates was forced to deny the proposal of IBM, as he did not have any drafts for creating OS at the moment. Therefore, the CEO of Microsoft was forced to recommend IBM to seek help from its competitor Digital Research, which later will be the developer of the OS for IBM personal computer.

Meanwhile, Microsoft buys a 'crude' operating system 86-DOS for $50,000 dollars from the Seattle Computer and hires Tim Paterson, the creator of 86-DOS. Bill Gates's company greatly refined 86-DOS, and soon the world saw MS-DOS, which Microsoft offered to use as the main OS for IBM personal computer, thus beating Digital Research. In September 1980, IBM signed a detailed contract with Microsoft. This contract was destined to change the history of the personal computer industry. Both IBM and Microsoft benefited from it. Gates' main competitor Digital Research changed the course of business and they were no longer involved in the competition.

In 1981, Microsoft becomes a corporation, the management of which is shared between Bill Gates and Paul Allen. In the same year, IBM introduces its personal computer with 16-bit operating system MS-DOS. In addition, the IBM PC includes other Microsoft products such as BASIC, COBOL, Pascal and others.

From Bill Gates biography we learned that in 1982, Gates convinced IBM management that MS-DOS should be sold under the license and other computer manufacturers, thereby making the competition of Apple, which was selling its computers based on its own operating system.

In 1983, The Microsoft Hardware group (formed in 1982) creates a manipulator called 'Mouse' for an easy data input into a computer with a graphical user interface. In the same year, the corporation presents a text editor for MS-DOS. In addition to all of these, the company of Bill Gates announced Windows – the extension of the operating system for MS-DOS as a universal operating environment for graphics applications.

[...]

Recognition and Philanthropy

[...]

In 2005, Queen Elizabeth II appointed Bill Gates (see http://news.bbc.co.uk/2/hi/uk_news/3428673.stm) an honorary Knight Commander of the Order of the British Empire (KBE) and he could use the post-nominal letters KBE after his name. In November 2006, the Mexican government awarded Bill Gates and his wife Melinda Gates with the Order of the Aztec Eagle for their philanthropic contributions in the world's development, especially in the health and education spheres.

Interview: Bill Gates, Co-Founder and Chairman, Microsoft Corporation - March 17, 2010, Seattle, Washington

Source - [HW003P][GDrive]

[...]

When did you first have the vision of a computer on every desk at work and in every home?

Bill Gates: Paul Allen and I had used that phrase even before we wrote the BASIC for Microsoft. We actually talked about it in an article in -- I think 1977 was the first time it appears in print -- where we say, "a computer on every desk and in every home..." and actually we said, "...running Microsoft software." If we were just talking about the vision, we'd leave those last three words out. If we were talking an internal company discussion, we'd put those words in. It's

very hard to recall how crazy and wild that was, you know, "on every desk and in every home." At the time, you have people who are very smart saying, "Why would somebody need a computer?" Even Ken Olsen, who had run this company Digital Equipment, who made the computer I grew up with, and that we admired both him and his company immensely, was saying that this seemed kind of a silly idea that people would want to have a computer.

When Microsoft was starting out, you guys made a deal with Apple Computer for a flat fee of $21,000 or something. What did you learn from that experience?

Bill Gates: Microsoft did the software for all the personal computers that came out. There was the Apple II that we did a BASIC for, which was called Apple Soft BASIC. There was a Commodore PET that we did a BASIC for. There was a Radio Shack TRS 80 that we did a BASIC for. Even Atari, who initially had their own mini-BASIC, ended up using our BASIC. So our BASIC was running on every single machine, including that Apple machine. We later did a BASIC for the Macintosh. We didn't mind doing low priced contracts at the time, because we always knew that there would be new versions and more software that we would do. So it worked out well. As part of that Apple deal, I got to know Steve Wozniak, who is actually the engineer and did software programming, and Steve Jobs, who later I would do a lot of work with, because he was deeply involved in the Macintosh work.

Apple sold a lot of those computers -- the Apple II. Wouldn't you have made a lot more money at that time if you had royalties?

Bill Gates: Well, we had plenty of ways to do new versions and add-ons and things. So no, the whole structure of the way we licensed things was that we knew we could write software more efficiently than if they hired the engineers themselves. So we always were able to say, "Hey, you would have spent a half a million developing that yourself. We'll license it to you for an inexpensive price." We probably could have had higher prices, but we were doing fine. In fact, that 6502 BASIC that Mark Chamberlain and I wrote, we licensed to about 12 different people. So our profitability was huge, even though it was a great deal for Apple. Per machine they paid almost nothing.

You came out very early against illegal copying of software. You wrote a piece for Computer Notes, warning that piracy could create serious obstacles for your industry.

Bill Gates: Yeah. The MITS Altair people agreed to pay us a royalty for each copy that was sold. So if people paid MITS we got a royalty, and if they just copied the program -- which was at the time on paper tape -- we didn't get paid. There was a lot of this going on, and the amount of piracy was going to determine whether Microsoft could hire more people or not. So I wrote -- it wasn't mean -- what was called "An Open Letter to Hobbyists," that said, "By the way, this is copyrighted material, and the more we sell, the more software we'll be able to write." And that started a debate that rages to this day, it will rage for decades to come. Should creative people who do music or books or software be able to get a royalty for their stuff, or should people pirate it? There's a lot of complicated issues in intellectual property, but it started early in the computer industry. A lot of people did actually respond to the letter by coming back and paying the license fee, which was very low. I mean, everything was very, very cheap.

When IBM first came to you for an operating system, you sent them to another company, Digital Research, first. Why did you do that?

Bill Gates:I had been talking about our BASIC, and running that on a computer. There's two ways you could run BASIC. You can run it where the BASIC is right on the hardware and the only thing you're running is BASIC, or you can put another layer of software in between, called an operating system, and it can take over some of the work, like managing the printers and things, and you can have many programs, BASIC or a spreadsheet or a word processor, running on top of that. And as we got disks on these computers, it made more sense to have that flexibility. The early computers don't have disks; they have cassette tapes and paper tapes and things like that. But by 1979, '80, we're starting to get these big, expensive -- actually, initially eight-inch -- floppy disks, then five-and-a-quarter inch, finally three-and-a-half inch. Now, when's the last time you saw a floppy disk? But they were very important. We still have a hard disk, the disk built into the computer. So you needed an operating system.

When IBM saw that we had written the software for all the personal computers, they came to us, sought our advice on the design, but we said, "You should put a disk in," and since they wanted to ship very quickly, another company called Digital Research had done that work for the 8-bit machines, and they were starting to do a version for these new 16-bit machines. We convinced IBM to do a 16-bit machine using this 8086, 8088 processor. Well, Digital Research really hadn't finished the work, and then IBM was getting frustrated because Digital Research wouldn't sign even the non-disclosure agreement, and then some of us, particularly Paul and a key person named Kazi Konishi, who was from Japan and worked with us, said, "No, no, no, we should just do that ourselves." And because of the quick timing, we ended up licensing the original code from another company and turned that into MS-DOS. So then subsequently, MS-DOS competed with this Digital Research CPM. After about two or three years, MS-DOS became far, far more popular than CPM, and then eventually we would take and add graphics capability on top of MS-DOS, and then integrate the two together. And so today when we talk about Windows, it actually includes all those MS-DOS things in it, that's the full operating system. Although mostly you think of the graphics and the windows and stuff, there's a lot of more classic operating system capability that's built in there.

Did you get a royalty from IBM for each computer they sold with MS-DOS?

Bill Gates: Actually, no. The IBM initial deal is a flat fee deal, another flat fee deal. It had certain restrictions that prevented IBM from selling to other hardware makers. So if people did IBM PC compatible machines, we would get the revenue by doing business directly with those people. And the deal was very complicated, but it was a deal that Steve Ballmer -- who's a key person with the company by that time -- and I thought a lot about. It was a fairly junior team from IBM, so we tried to make sure that -- given our belief that personal computers would be hyper-popular -- that Microsoft would get a lot of that upside. So they felt they got a very good deal, which they did, but as the industry expanded, we -- for new versions and for different machines -- we got that opportunity, even though they did not pay us a royalty.

When did you realize just how wildly successful this business would be?

Bill Gates: Even in the early days, if you set a computer on every desk in every home, and you'd say, "Okay, how many homes are there in the world? How many desks are there in the world? Can I make $20 for every home, $20 for every desk?" you could get these big numbers. But part of the beauty of the whole thing was we were very focused on the here and now. Should we hire one more person? If our customers didn't pay us, would we have enough cash to meet the payroll? We really were very practical about that next thing, and so involved in the deep engineering that we didn't get ahead of ourselves. We never thought how big we'd be. I remember when one of the early lists of wealthy people came out and one of the Intel founders was there, the guy that ran Wang computers actually was still -- Wang was still doing well -- and we thought, "Hmm. Boy, if the software business does well, the value of Microsoft could be similar to that." But it wasn't a real focus. The everyday activity of just doing great software drew us in. And some decisions we made -- like the quality of the people, the way we were very global, the vision of how we thought about software -- that was very long term. But other than those things, we just came into work every day and wrote more code and hired more people. It wasn't really until the IBM PC succeeded, and perhaps even until Windows succeeded, that there was a broad awareness that Microsoft was very unique as a software company, and that these other companies had been one-product companies,

hadn't hired people, couldn't do a broad set of things, didn't renew their excellence, didn't do research. So we thought we were doing something very unique, but it was easily not until 1995, or even 1997, that there was this wide recognition that we were the company that had revolutionized software.

[...]

Your parents took you out of public school to send you to the Lakeside School. Apparently that school had a big impact on you. Why did they make that move?

Bill Gates: My parents had this notion that I had this high potential somehow and that I was not taking advantage of it. The environment that I had been in, sort of being a goof-off was more socially rewarding than being that serious. It was public school, so they weren't pushing people all that hard. You could read the textbook in the first week and there wasn't anything interesting going to happen the rest of the school year. **So they had me take an exam to go to a private school. And I thought, "Well, should I pass this exam or not? You could fail it and you wouldn't have to go." But that sort of violated my sense of integrity. "Hey, I'm good at taking tests. I don't want to get confused about that." So I was admitted and they encouraged me to go.** It was a boys' school, reasonably strict. During the time I was there it actually transitioned, merged with a girls' school and stopped having uniforms, stopped calling the teachers "Master." So it became pretty normal, but it was a change at first. And the idea of just being kind of a goof-off wasn't the sort of high reward position like it had been in public schools. So my parents were right, it had the intended effect of creating a more challenging environment. And some teachers who were nice about saying that I should try harder, and exposing me to a lot of math and science, and eventually that's where I got to use the computer.

We've read that at first you weren't thrilled about the transfer to Lakeside.

Bill Gates: Lakeside was a longer school day, and it's a change. I had gotten super comfortable at public school, kind of being goofy, and here people were studying, and at first, because I didn't get great grades, they had me in a study hall, and a few people who got really good grades didn't have to go to the study hall. Nobody knew that I was actually clever, so they were actually treating me like some average student. Anyway, it was an adjustment. All the other kids there were making the adjustment as well. So it took a couple of years to get my grounding. I'm super glad that I went to that school. It is a fantastic school. I'll probably send my kids to that school.

[...]

After you got kicked off the C Cubed system, was that tough, spending the summer without a computer?

Bill Gates: Yeah, well no. I had many things that were interesting. I was really quite serious about math at the time and various science things. Paul had actually read more science fiction that I had, by a lot, so he and I would talk about that. But I had plenty of things, it wasn't some great tragedy. But then we got pulled back in, and then that company went bankrupt, and then we had the work for this Portland company on the payroll program, and then we had the scheduling program.

We were lucky. There were always kinds of things that not only gave us an opportunity, but exposed us to that next level. **After the payroll program, then there was a computer project to use computers to control all the electricity grid in the dams of the Pacific Northwest. A government agency called Bonneville Power had done a contract with a company called TRW to use computers to do all this control. And TRW had committed to do all this really high-reliability great software work. Well, they found it more difficult than they expected, so they were looking for people who understood these kinds of computers, which Paul Allen and I had done a lot of work on.** These were the same computers that were at Computer Center Corporation and at this Portland company, Information Sciences. Anyway, we were kind of famous -- **but nobody had met us -- because we had filed these problem reports. And by the end of these problem reports -- they were so sophisticated -- it was like, "Who are these guys out in Seattle telling us how to fix all this stuff?" So when TRW was saying, "Hey, we're desperate. Find us..." they're telling Digital Equipment, who makes these things, "Find us the best programmers," and somebody says, "Well, there's Gates and Allen..." and somebody says, "Nobody's really met them, but yeah, they're really good, we ought to be able to track them down." So they find us, this one guy, and we go for an interview. And these two kids show up and -- what was I when I was interviewed? I was 16 when they interviewed me. So they were like, "We can't hire you." But then they talked to us about software and we clearly know a lot. And when you're young and you know a lot, people don't have any kind of intermediate thing. You're either what you're supposed to be, which is a kid that doesn't know that much, or they think, "Whoa, this guy is the limit!" We were pretty good programmers. But anyway, so we got jobs at this TRW and that exposed me to some programmers, who were way better than I was, who critiqued my work. I could look at their work. And this one guy was really a phenomenal programmer.**

[So were they good or not? If they ripped it up and provided criticism, how much value did they really add???]

Was that John Norton?

Bill Gates: Yeah. He would just take my stuff and rip it apart, you know, in this super constructive way. Anyway, it was a brilliant thing. So part of my senior year, and the summer before and after the senior year, Paul and I were down in Vancouver, Washington. So it kind of took our understanding to a whole new level, and it exposed us to a bunch of people there. And Paul, the whole time -- ever since he'd seen that microprocessor article -- was saying, "You know, there's an opportunity here. This is going to be big. We ought to think what we're going to do about this." So we kept talking about that.

[...]

But you didn't even have the machine, did you?

Bill Gates: Yeah, that's a complication. When you turn a computer on, there's nothing in it. It doesn't even know how to go out to the teletype and read this paper tape that has all these funny numbers on it that are this program. So you have to put in -- using the switches -- a little program, that's the program called the bootstrap loader that is the instructions to say, "Hey, go read a bunch of numbers off of this paper tape, put those into the memory and then go run that program." So he wrote a bootstrap loader, literally on the plane flying there, he wrote a nice bootstrap loader. It worked just fine. Later I wrote a really, really small one, because it's a pain to have to -- every time the computer is turned back on you have to reenter the thing, so the less of these funny little instructions, the better. Anyway, so he wrote that, and everybody was amazed because we had to do everything totally right, how we read this instruction set manual and they were selling these kit computers, but they had never really seen it do anything real. **And so Paul would type in 'Print 2 plus 2.' Print..." and he ran programs and it worked.**

And this was a machine that you had never actually seen.

Bill Gates: That's right. The chip itself was fairly expensive. Paul and I had bought a previous chip to do a very specialized machine. We had bought an 8008 to do a little funny program that did traffic volume printouts, but this 8080 was much better. And we had never had one of those, so we just read the book

that described how it worked. And then we made the big computer that we'd been using all those years -- and we're quite expert in -- Paul had a really breakthrough idea of how to do the simulation thing. So that gave us the full power of that computer to edit and debug and those things. But if we had any mistake in how we read this thing, that paper tape wasn't going to work at all. Anyway, so that was very exciting, and we signed a deal with them. That was called MITS, and their computer was called the Altair. And then I left Harvard University and we started Microsoft. So Microsoft was initially based down in Albuquerque, New Mexico. And this is 1973 when we get going.

How did the name Microsoft come about? Do you remember?

Bill Gates: You know, we had been talking about that actually back at Harvard, microcomputer software, and nobody else had done a company doing software for these things, and we thought it was a cool term, "Microsoft." When we had been kids and sending our names in for mailing lists we'd played around with a lot of company names, including "Allen & Gates" or things like that, but we decided no, it would be better not to have our names in it, because it wasn't like a law firm that was always kind of a small thing. We thought, "Hey, we're going to have a big company, so we'll have a company name." So "Microsoft" was a very natural choice.

When Ed Roberts of MITS agreed to buy your program, you included a "best efforts" clause requiring him to try to sublicense and promote your software. How did that turn out?

Bill Gates: Microsoft was only a few people and we'd written this BASIC, and the idea was to license it to lots of companies and then to write other software. So the head of MITS said he could help us market it to other people and take a sales commission for that, and I wrote the contract so that if they weren't serious about promoting it and putting a lot of investment into that, they would lose that right. That was the "best efforts" clause, a very strong requirement. They never got serious about that, and yet they kind of liked the idea of them having the BASIC and other people not. So we were discussing that, how we were going to resolve this problem, because we needed to license it to other people, and we were doing all the work to license it to other people even though they were getting this commission. And right at that time, another company, Pertec, bought MITS, and then those people got confused about the contract and so they weren't even paying us the money they owed us. They were essentially trying to starve us, so we terminated the contract. It had an arbitration clause. The arbitrator found that we were right. Five out of five reasons to terminate the contract, we were only right about five of them! So that contract was terminated. And then we had to -- like, we ended up having to do -- built our sales and marketing activities. And by then we started to have some other programs as well. So we started to hire more people and things really got going. The big thing though, was that because Pertec moved that company out to California, we no longer had a reason to be in Albuquerque, because you couldn't recruit people there as easily as you could to other locations. So we talked about where to move, and eventually, in 1979, we move up to Seattle.

When you decided to leave Harvard to just concentrate on business, what was your parents' reaction?

Bill Gates: [...] when it came time to go on leave from Harvard, the policies of the school about -- if you're gone -- letting you come back are incredibly generous. So if the enterprise had failed, then I would have been back. So my parents were a little surprised, and kind of wondering what it meant, but they were pretty supportive. **And in fact, when we got into this legal dispute with Pertec, my dad gave me good advice.** He was very supportive on that, and so we saw that through. And then, as the company became successful, I hope they felt better about it. The only really bad case was if I stayed and the company was kind of mediocre-ally successful. If it failed it would be okay, if it was a big success it would be okay, and they could see I was very energized. And I thought we needed to get in at the very beginning and not waste a year or two, which is what I had left of my undergraduate course requirements.

[...]

Do you ever wonder what would have happened if the BASIC program for MITS had not worked?

Bill Gates: Oh, I don't think it would have been a dramatic setback. We would have figured out what mistake we'd made and eventually gotten the thing running. It turns out, even though we were in this big rush, there weren't many other people doing serious work at the time. It was another couple of years before other software companies showed up. And even then, they weren't that serious about hiring people. They didn't have people who really understood about writing software, and how you created a company around writing software. They didn't figure out the global nature of the market. So we would have been fine. But it was certainly exciting that there was no mistake at all.

2000 (Dec 31) - Washington Post - "Alter Egos" By Mark Leibovich (Fourth in a series)

Source - [HN00Z4][GDrive]

A child prodigy, William Henry Gates III (nicknamed "Trey," card-playing slang for a three) spent much time cocooned in his room. When his mother, Mary, asked over the intercom what he was doing, he would shout, "I'm thinking. . . . Have you ever tried thinking?" Small for his age, Gates was subject to bullying. "The Gateses didn't know what to do with Trey," says the **Rev. Marvin Evans,** the father of Gates's best friend in adolescence.

[...]

In building Microsoft, however, Gates and Ballmer became a network unto themselves. They are stylistic opposites, both open to caricature: Gates has the nasal voice and pasty complexion of the petulant nerd. Ballmer, 6 feet 1, 225 pounds, bald and loud -- his vocal cords once required surgical repair from excessive shouting -- is the corporate evangelist.

It was clear that Bill Gates had had enough.

The company he had founded and built into a colossus was taking a beating from federal antitrust lawyers. His competitors were emboldened, and the marketplace was chaotic. Chief among his frustrations was that he was spending little time on the technology work he loved most.

marketplace was chaotic. Chief among his frustrations was that he was spending little time on the technology work he loved most.

At one meeting, Gates's voice broke and his eyes teared up. Over the next several months, colleagues noticed that he was becoming increasingly overwrought, distracted, quicker tempered. He seemed to be losing weight and sleep.

So early this year, the world's richest man gave himself a present. He restored himself to full-time nerd status, stepping down as chief executive of Microsoft and assuming the title of chief software architect. He would remain as chairman of the company, but the rest he would leave to his best friend, the new CEO, Steve Ballmer.

On Jan. 13, the day the switch was to be announced, Gates called a few friends to tell them.

"Well, Steve certainly got the short end of that stick," longtime Microsoft executive Nathan Myhrvold told Gates.

"I know, he really did," Gates said, laughing. "Thank God he's willing to do this for me."

Steve Ballmer would do nearly anything for Bill Gates. Likewise Gates for Ballmer. Although the two men were assuming new roles, it was clear to anyone close to Microsoft that the company's intellectual and emotional core would still reside where it always has: in the complex and symbiotic relationship between Gates and Ballmer, the new economy's most powerful partnership.

To understand the bond between them is to understand why Microsoft has become the exemplar of new-economy dominance -- and America's most famously embattled company.

By now, Gates has achieved the stature of an icon, both for computing generally and Microsoft specifically. But throughout his life he has always picked out an alter ego, someone who could nourish less-developed sides of himself while matching his brainpower and zeal. He and Ballmer have been friends since they were Harvard dormmates 26 years ago. Since Ballmer joined Microsoft in 1980, the two men have come to function almost as a single executive.

Like many high-tech pioneers, the two enjoyed comfortable suburban childhoods that whetted, rather than dulled, their drive to succeed. They embody the old-money and new-money prototypes of 20th-century affluence: Gates is the great-grandson of the man who founded Seattle's National City Bank in 1911; Ballmer's father, a Swiss immigrant who settled his family in the Detroit suburb of Farmington Hills, was a Ford Motor Co. accountant who began trumpeting his expectation that his son would attend Harvard when the boy was 8.

Both endured early social problems that friends say marked them for life. Ballmer was so shy, he would hyperventilate before going to Hebrew school. "I was just so scared," he says. "So I wouldn't throw up, my mom would have to make me take short breaths." Today, his motivational speeches at Microsoft events are legend -- but before he gets to the part where he runs through high-fiving, cheering crowds till he doubles over, sweating and panting, he has to psych himself into the idea that he's up to the performance.

[...]

Gates, friends say, has an instinctive ability to "outsource" a large part of his intellect and psyche to others. Ballmer can perform this role mainly on the force of his personality, his willingness and ability to fight back. "Steve has found a way to work with Bill without subjugating himself," Raburn says. "The moment you subjugate yourself to Bill, it can get a little dangerous. . . . He can be an alpha male in collaborative situations."

While he and Ballmer are similar in fundamental ways, Gates can appreciate that Ballmer has a radically different style, personality and outlook, all of which can be useful to Microsoft, and him. The distinctions abound.

Gates is a nearly mystical figure at Microsoft. Ballmer is frontally engaged.

Gates communicates largely by e-mail, a point underscored by his elaborate responses to follow-up questions in the days after the interview. Ballmer, a fat-fingered and erratic e-mailer ("graet tnx"), invades personal space, pops his head into offices and often startles. Gates loves bridge, Ballmer loves basketball. Gates nibbles at French fries, Ballmer eats muffins by ripping the tops off. At a toast during Gates's bachelor party weekend in Las Vegas in late 1993, Ballmer, his best man, teased his friend as "someone who sees life as complex," rife with shades of gray. "NOT ME," he boomed. "WITH ME, IT'S BLACK OR WHITE, ON OR OFF."

Gates hates being touched. "Bill gives off a physical reaction that says, 'Step back a little bit,' " says Christine Comaford, a Gates friend who worked at Microsoft in the 1980s. One former Microsoft executive recalls walking through the Tokyo airport with Gates in 1996. Gates instructed the executive to appear as if they were locked in an intense conversation, so celebrity-seekers would be less likely to approach.

"Steve is a guy you want to be loyal to," Comaford says. "Bill is more of a guy to be in awe of."

Ballmer has been called the company's id. In the late 1980s, acting on a challenge from another executive, he stripped to his white boxers and swam across Lake Bill, a man-made lake at the center of Microsoft's campus.

When called upon, he'll also play bad cop. "Bill can be a complete wimp," Myhrvold says. He's a lousy negotiator, Myhrvold says. "There was one very big acquisition deal where Bill says to me, 'Now, don't let me get alone with this guy, because I'll just agree.' " Myhrvold adds that Ballmer doesn't relish playing the tough guy, and if he offends someone, he often acts "like a Saint Bernard puppy who knocks you over and then starts licking your face."

He is also prone to mood swings -- "We're golden, we're golden," Ballmer will say in an up moment, and "We're screwed, we're screwed," during the inevitable swoon. Gates wallows in problems, "tastes every drop of misery," a Microsoft executive says.

In September 1996, Gates made a presentation at San Francisco's Moscone Center to announce the launch of its latest version of Explorer. Afterward, he took some engineers and executives to the hotel bar next door to celebrate.

But Gates, drinking white Russians, fixated on a Microsoft e-mail product and started working him self up about "what a piece of [expletive]" it was. His tablemates had nothing to do with the product, and prodded Gates. "Yeah," Gates said, "that's the worst piece of software we've ever shipped," and he ranted for about 20 minutes.

At a 1998 meeting with seven managers who worked on Microsoft Office, Ballmer was not pleased with the answers. "Does anyone here understand Office?" he yelled, according to someone at the meeting. He jumped up from a conference table in Building 18, his shirt coming untucked in the back. "Anyone?" He told a nearby secretary to "get someone on the phone who understands Office."

Ballmer and Gates's relationship is commonly called a "marriage," even by the principals. "We trusted each other from the very beginning in a very deep

way," Gates says. It is a hallmark of their relationship that they treat each other as roughly as they treat others. Microsoft executive Deborah Willingham recalls a meeting shortly after the release of Windows 95. Excess software was accumulating in stores. Ballmer took responsibility, but Gates wouldn't let the issue die.

"Why do we do this?" he said.

"Look, I said I made that mistake," Ballmer thundered to the man his children call Uncle Bill. "How many times do you want to hear me say I made that mistake?"

"Well," Gates said, smiling, "I might want to hear it a few more times."

The intimacy of Gates's partnerships was established early on. Kent Hood Evans was his boyhood best friend and first business collaborator. Kent was dreamy, dogged and largely devoid of inhibition. He carried Barron's and Fortune around Lakeside in his enormous briefcase. In a re{acute}sume{acute} for a summer job, he wrote: "I am looking for a job that involves programming that I consider interesting." He pushed Gates to think big and take risks.

Evans loved politics and government and even asked Gates if he wanted to join him in a foreign service career. Maybe it could result in an ambassadorship. "This is, like, ninth grade," Gates says.

They would speak for hours on the phone at night, sharing ideas about business and computers. They had a deep understanding of their subject and communicated in a kind of shorthand. At Microsoft, Gates calls this "high-bandwidth communication."

In the late 1960s, Lakeside was one of the first schools in the country to have a computer. It was a Teletype machine about the size of a microwave oven, and it became a magnet for math whizzes Gates and Evans and upperclassmen Paul Allen and Ric Weiland, who would become one of Microsoft's first employees. They formed the Lakeside Programmers Club, but it was no hobbyists' group. The goal was to make money.

The club operated with minimal supervision. This was by design, says Fred Wright, the Lakeside math chairman, who provided that supervision. "Our philosophy was, get a group of smart people together, give them tools and get out of the way," Wright says. That, he says, is the best environment to spur creativity, competition and collaboration. "If you want to see the roots of Microsoft's culture, look no further than the Lakeside Programmers Club," Kent's father says.

The four boys spent late-night hours at Seattle's Computer Center Corp. ("C-cubed"), which offered time on a Digital Equipment Corp. machine per an agreement with Lakeside. When C-cubed went out of business in 1970, the Lakeside Programmers Club nearly imploded in civil war. Gates and Evans arranged to buy a set of DEC tapes cheap in a bankruptcy auction -- without the knowledge of their partners. They hid the tapes in a room at Lakeside, and when Allen learned of this, he found and kept them. Livid, Gates and Evans threatened legal action. They were 15.

Bill and Kent were inseparable and overextended. School and computers ate up most of their time, the latter more so as they took on consulting jobs -- often in exchange for computing time. In their junior year, 1971-1972, a Lakeside teacher enlisted them to automate the school's class-scheduling system. They pulled a string of all-nighters, hoping to have the program ready for their senior year. Evans took a break to go mountain climbing over the Memorial Day weekend. He slipped and fell to his death on May 28, 1972, in an accident his father attributes to the fatigue that came with his schedule.

"I was devastated," Gates writes in an e-mail. Gates was scheduled to speak at Kent's funeral, but he was too distraught. When Marvin Evans met Melinda Gates a few years ago, she said her husband still talked about Kent all the time.

"It's been nearly thirty years," Gates writes, "and I still remember his phone number."

Even in his grief, Gates was determined to finish the Lakeside scheduling project. In choosing a new collaborator, he turned to Paul Allen.

The world's first personal computer.

[...]

From the time he dropped out of Harvard, Gates kept track of Ballmer. They spoke by phone, and Ballmer even visited Albuquerque. Ballmer first went to work at Procter & Gamble, where he learned how to market Coldsnap Freezer Dessert Makers and, later, Duncan Hines cake mixes.

"Steve was extremely intense, very personable and probably the smartest man I've ever met," says Gordon Tucker, who worked with Ballmer at P&G. Ballmer's knowledge was vast and versatile, but none of Ballmer's colleagues remembers him expressing interest in computers.

Nor do any of them describe him as shy, but Ballmer says he battled his shyness perpetually. When he grew tired of selling cakes, he wanted to try his hand at screenwriting. But he was petrified to tell his P&G boss that he was leaving. To work up his nerve, he rolled down the windows of his blue Mustang and turned Rod Stewart's "Do You Think I'm Sexy?" up to the radio's full volume.

At Stanford Business School -- his next stop after a brief stay in Hollywood -- Ballmer would perform similar rituals en route to class. "He would keep telling himself, 'I'm gonna kick some ass in class today,' " says classmate Dan Rudolph, who rode with him. The sound track for this mantra was often Michael Jackson's "Rock With You."

Unlike Harvard and other East Coast business schools, Stanford placed a heavy emphasis on cooperation and teamwork. Ballmer was well liked at Stanford, but his manic style of engagement and competition played badly with some. So did his habit of advertising all the prestigious consulting firms that were offering him jobs.

So it surprised some of his Stanford friends to learn that Ballmer, after only a year, was considering a job with an unknown software company in Seattle, where Microsoft had moved in 1979 (the hyphen died in 1976). But friends recall Ballmer expressing conflicting desires -- between traditional paths to success and something riskier.

Ballmer liked Gates's ambitions, plus "he has always put a great deal of value on personal relationships," says Michael Levinthal, a Stanford classmate. "Here was this guy, Bill Gates, who he clearly trusted. And when Steve trusts someone . . . he'll invest a great deal."

Even at 24, Ballmer had fashioned a business identity for himself. He had grown comfortable in important but supportive roles: As a business manager of the Harvard Crimson, he supported the efforts of the writers and editors. As manager of the football team, he worked behind the scenes while others played the game. He was comfortable with dirty work. "There are two ways to succeed in business," he has told at least two people. "One is to have the big insights. The

other is to take the big insights and make it happen."

At that point, in 1980, Microsoft needed someone who would confront the challenges of running a growing business: hiring, personnel, finances. Essentially, Gates sought someone with whom he could join in a business mind-meld -- to complement the mind-meld on technology issues he already had with Allen.

Gates sealed Ballmer's commitment to Microsoft in a ship-to-shore phone call from a sailboat in the British Virgin Islands. He offered him a salary of $50,000 and, more important, a significant equity stake in the company -- 5 percent to 10 percent. This raised some hackles among the tight-knit group of early Microsoft employees, many of whom held a natural bias against non-techies like Ballmer. He was employee No. 24.

The Gates-Ballmer marriage erupted in quarreling before the honeymoon ended. In one of Ballmer's first acts at Microsoft, he insisted that the company needed to hire 17 people. But for all his aggressive goals, Gates could be very tight with the corporate dollar. He maintained that Microsoft never take on debt and always have enough money to operate for a year without any sales.

"You're trying to bankrupt me," Gates accused Ballmer. After some argument, they hashed out a compromise: Ballmer could hire new employees, but only if the company's revenue grew accordingly.

The issue of revenue growth was quickly mooted as Microsoft became the premier independent software company in an industry that was growing even more dramatically than Gates and Allen had imagined. Ballmer was instrumental in what would be the key business sequence in the company's early history: He helped Gates and Allen secure the purchase of the Disk Operating System (DOS) from a small Seattle firm in 1980. DOS allowed applications software to work on personal computers, and it became the foundation for Microsoft's flagship product, MS-DOS. Ballmer then helped negotiate a landmark deal with International Business Machines to run MS-DOS on IBM's machines -- and on millions of IBM clones.

Gates and Allen remained Microsoft's resident icons and visionaries, but as Microsoft prospered in the 1980s, Ballmer assumed an in-house status to rival theirs. And through Gates and Ballmer's frequent and heated discussions, they thrived -- as if discord galvanized a deeper trust.

Gates and Allen fought a lot, too, and over time it seemed to wear Allen down. "Working with and for Bill can be a very intense process," Allen says diplomatically. Early Microsoft employees remember that Gates and Allen would argue loudly, often over hard-core technology issues, but even over small things. One early employee recalls a "friendly" chess match between the two partners degenerating into a Gates tantrum in which he scattered the pieces on the board.

Over time, the co-founders' relationship grew strained. Allen's hours diminished, especially next to workaholic Gates's and Ballmer's. After a bout with Hodgkin's disease, Allen left Microsoft in 1983.

But Gates is reluctant to lose close friends. He worked hard to repair his relationship with Allen. In 1986, the same year Microsoft's initial public offering sent the co-founders' paper fortunes soaring into the hundreds of millions, Gates and Allen gave Lakeside School $2.2 million to build a science and math center.

A plaque outside the auditorium bears this dedication: "In memory of classmate, friend and fellow explorer, Kent Hood Evans."

With Allen gone, Gates came to rely even more heavily on Ballmer, whose influence quickly expanded to every quadrant as Microsoft became the symbol of the high-tech boom.

In the 1980s, Ballmer helped oversee the team that produced the Windows operating system (engineers recall him stalking the halls at 2 a.m., clapping his hands and screaming, "Yes, yes, yes"). He built and spearheaded one of computing's most aggressive sales organizations ("Get the business, get the business"). He was Microsoft's most rabid cost watchdog ("That's big-shotty," he sniffed to an executive who had bought a cell phone in the late 1980s).

[...]

MAY 2011 article in Vanity Fair - By Paul Allen - MICROSOFT'S ODD COUPLE / THE TECH REVOLUTION

[HP0030][GDrive]

As I got ready to go to Albuquerque, Bill began to worry. What if I'd screwed up one of the numbers used to represent the 8080 instructions in the macro assembler? Our BASIC had tested out fine on my simulator on the PDP-10, but we had no sure evidence that the simulator itself was flawless. A single character out of place might halt the program cold when it ran on the real chip. The night before my departure, after I knocked off for a few hours of sleep, Bill stayed up with the 8080 manual and triple-checked my macros. He was bleary-eyed the next morning when I stopped by en route to Logan Airport to pick up the fresh paper tape he'd punched out. The byte codes were correct, Bill said. As far as he could tell, my work was error-free.

The flight was uneventful up until the plane's final descent, when it hit me that we'd forgotten something: a bootstrap loader, the small sequence of instructions to tell the Altair how to read the BASIC interpreter and then stick it into memory. A loader was a necessity for microprocessors in the pre-ROM era; without one, that yellow tape in my briefcase would be worthless. I felt like an idiot for not thinking of it at Aiken, where I could have coded it without rushing and simulated and debugged it on the PDP-10.

Now time was short. Minutes before landing, I grabbed a steno pad and began scribbling the loader code in machine language—no labels, no symbols, just a series of three-digit numbers in octal (base 8), the lingua franca for Intel's chips. Each number represented one byte, a single instruction for the 8080; I knew most of them by heart. "Hand assembly" is a famously laborious process, even in small quantities. I finished the program in 21 bytes—not my most concise

most of them by heart. "Hand assembly" is a famously laborious process, even in small quantities. I finished the program in 21 bytes—not my most concise work, but I was too rushed to strive for elegance.

I came out of the terminal sweating and dressed in my professional best, a tan Ultrasuede jacket and tie. Ed Roberts was supposed to pick me up, so I stood there for 10 minutes looking for someone in a business suit. Not far down the entryway to the airport, a pickup truck pulled up and a big, burly, jowly guy—six feet four, maybe 280 pounds—climbed out. He had on jeans and a short-sleeved shirt with a string tie, the first one I'd seen outside of a Western. He came up to me, and in a booming southern accent he asked, "Are you Paul Allen?" His wavy black hair was receding at the front.

I said, "Yes, are you Ed?"

He said, "Come on, get in the truck."

As we bounced over the city's sunbaked streets, I wondered how all this was going to turn out. I'd expected a high-powered executive from some cutting-edge entrepreneurial firm, like the ones clustered along Route 128, the high-tech beltway around Boston. The reality had a whole different vibe. (On a later trip to Albuquerque, I came down from a plane and got hit in the head by tumbleweed on the tarmac. I wasn't in Massachusetts anymore.)

]

Ed said, "Let's go over to MITS so you can see the Altair." He drove into a low-rent commercial area by the state fairgrounds and stopped at a one-story strip mall. With its brick façade and big plate-glass windows, the Cal-Linn Building might have looked modern in 1955. A beauty salon occupied one storefront around the corner. I followed Ed through a glass door and into a light industrial space that housed MITS's engineering and manufacturing departments. As I passed an assembly line of a dozen or so weary-looking workers, stuffing kit boxes with capacitors and Mylar circuit boards, I understood why Ed was so focused on getting a BASIC. He had little interest in software, which he referred to as variable hardware, but he knew that the Altair's sales wouldn't keep expanding unless it could do something useful.

When I arrived, there were only two or three assembled computers in the whole plant; everything else had gone out the door. Ed led me to a messy workbench, where I found a sky-blue metal box with ALTAIR 8800 stenciled on a charcoal-gray front panel. Modeled after a popular minicomputer, with rows of toggle switches for input and flashing red L.E.D.'s for output, the Altair was 7 inches high by 18 inches wide. It seemed fantastic that such a small box could contain a general-purpose computer with a legitimate C.P.U.

Hovering over the computer was Bill Yates, a sallow, taciturn string bean of a man with wire-rimmed glasses—Stan Laurel to Ed's Oliver Hardy. He was running a memory test to make sure the machine would be ready for me, with the cover flipped up so I could see inside. Plugged into slots on the Altair bus—an Ed Roberts innovation that was to become the industry standard—were seven 1K static-memory cards. It might have been the only microprocessor in the world with that much random-access memory, more than enough for my demo. The machine was hooked up to a Teletype with a paper-tape reader. All seemed in order.

It was getting late, and Ed suggested that we put off the BASIC trial to the next morning. "How about dinner?" he said. He took me to a three-dollar buffet at a Mexican place called Pancho's, where you got what you paid for. Afterward, back in the truck, a yellow jacket flew in and stung me on the neck. And I thought, This is all kind of surreal. Ed said he'd drop me at the hotel that he'd booked for me, which I'd thought would be something like a Motel 6. I'd brought only $40; I was chronically low on cash, and it would be years before I'd have a credit card. I blanched when Ed pulled up to the Sheraton, the nicest hotel in town, and escorted me to the reception desk.

"Checking in?" the clerk said. "That will be $50."

It was one of the more embarrassing moments of my life. "Ed, I'm sorry about this," I stammered, "but I don't have that kind of cash."

He just looked at me for a minute; I guess I wasn't what he'd been expecting, either. Then he said, "That's O.K., we'll put it on my card."

The following morning, with Ed and Bill Yates hanging over my shoulder, I sat at the Altair console and toggled in my bootstrap loader on the front panel's switches, byte by byte. Unlike the flat plastic keys on the PDP-8, the Altair's were thin metal switches, tough on the fingers. It took about five minutes, and I hoped no one noticed how nervous I was. This isn't going to work, I kept thinking.

I entered my 21st instruction, set the starting address, and pressed the Run switch. The machine's lights took on a diffused red glow as the 8080 executed the loader's multiple steps—at least that much seemed to be working. I turned on the paper-tape reader, and the Teletype chugged as it pulled our BASIC interpreter through. At 10 characters per second, reading the tape took seven minutes. (People grabbed coffee breaks while computers loaded paper tape in those days.) The MITS guys stood there silently. At the end I pressed Stop and reset the address to 0. My index finger poised over the Run switch once again …

To that point, I couldn't be sure of anything. Any one of a thousand things might have gone wrong in the simulator or the interpreter, despite Bill's double-checking. I pressed Run. There's just no way this is going to work.

The Teletype's printer clattered to life. I gawked at the uppercase characters; I couldn't believe it.

But there it was: MEMORY SIZE?

"Hey," said Bill Yates, "it printed something!" It was the first time he or Ed had seen the Altair do anything beyond a small memory test. They were flabbergasted. I was dumbfounded. We all gaped at the machine for a few seconds, and then I typed in the total number of bytes in the seven memory cards: 7168.

"OK," the Altair spit back. Getting this far told me that 5 percent of our BASIC was definitely working, but we weren't yet home free. The acid test would be a standard command that we'd used as a midterm exam for our software back in Cambridge. It relied on Bill's core coding and Monty's floating-point math and even my "crunch" code, which condensed certain words (like "PRINT") into a single character. If it worked, the lion's share of our BASIC was good to go. If it didn't, we'd failed.

I typed in the command: PRINT 2+2.

The machine's response was instantaneous: 4. That was a magical moment. Ed exclaimed, "Oh my God, it printed '4'!" He'd gone into debt and bet everything on a full-functioning micro-computer, and now it looked as though his vision would come true.

"Let's try a real program," I said, trying to sound nonchalant. Yates pulled out a book called 101 BASIC Computer Games, a slim volume that DEC had brought out in 1973. The text-based Lunar Lander program, created long before computers had graphics capability, was just 25 lines long. Still, I thought it might

out in 1973. The text-based Lunar Lander program, created long before computers had graphics capability, was just 35 lines long. Still, I thought it might build Ed's confidence. I typed in the program. Yates launched his lunar module and, after a few tries, settled it safely on the moon's surface. Everything in our BASIC had worked.

Ed said, "I want you to come back to my office." Through a flimsy-looking doorway, I took a seat in front of his desk and the biggest orange glass ashtray I had ever seen. Ed was a chain-smoker who'd take two or three puffs, stub the cigarette out, and light the next one. He'd go through half a pack in a single conversation.

"You're the first guys who came in and showed us something," he said. "We want you to draw up a license so we can sell this with the Altair. We can work out the terms later." I couldn't stop grinning. Once back at the hotel, I called Bill, who was thrilled with the news. We were in business now, for real; in Harvard parlance, we were golden. I hardly needed a plane to fly back to Boston.

Micro-manager

In the life of any company, a few moments stand out. Signing that original BASIC contract was a big one for Bill and me. Now our partnership needed a name. We considered Allen & Gates, but it sounded too much like a law firm. My next idea: Micro-Soft, for microprocessors and software. While the typography would be in flux over the next year or so (including a brief transition as Micro Soft), we both knew instantly that the name was right. Micro-Soft was simple and straightforward. It conveyed just what we were about.

From the time we'd started together in Massachusetts, I'd assumed that our partnership would be a 50-50 proposition. But Bill had another idea. "It's not right for you to get half," he said. "You had your salary at MITS while I did almost everything on BASIC without one back in Boston. I should get more. I think it should be 60-40."

At first I was taken aback. But as I pondered it, Bill's position didn't seem unreasonable. I'd been coding what I could in my spare time, and feeling guilty that I couldn't do more, but Bill had been instrumental in packing our software with "more features per byte of memory than any other BASIC we know," as I'd written for Computer Notes. All in all, I thought, a 60-40 split might be fair.

A short time later, we licensed BASIC to NCR for $175,000. Even with half the proceeds going to Ed Roberts, that single fee would pay five or six programmers for a year.

Bill's intensity was nonstop, and when he asked me for a walk-and-talk one day, I knew something was up. We'd gone a block when he cut to the chase: "I've done most of the work on BASIC, and I gave up a lot to leave Harvard," he said. "I deserve more than 60 percent."

"How much more?"

"I was thinking 64-36."

Again, I had that moment of surprise. But I'm a stubbornly logical person, and I tried to consider Bill's argument objectively. His intellectual horsepower had been critical to BASIC, and he would be central to our success moving forward—that much was obvious. But how to calculate the value of my Big Idea—the mating of a high-level language with a microprocessor—or my persistence in bringing Bill to see it? What were my development tools worth to the "property" of the partnership? Or my stewardship of our product line, or my day-to-day brainstorming with our programmers? I might have haggled and offered Bill two points instead of four, but my heart wasn't in it. So I agreed. At least now we can put this to bed, I thought.

Our formal partnership agreement, signed on February 3, 1977, had two other provisions of note. Paragraph 8 allowed an exemption from business duties for "a partner who is a full-time student," a clause geared to the possibility that Bill might go back for his degree. And in the event of "irreconcilable differences," paragraph 12 stated, Bill could demand that I withdraw from the partnership.

Later, after our relationship changed, I wondered how Bill had arrived at the numbers he'd proposed that day. I tried to put myself in his shoes and reconstruct his thinking, and I concluded that it was just this simple: What's the most I can get? I think Bill knew that I would balk at a two-to-one split, and that 64 percent was as far as he could go. He might have argued that the numbers reflected our contributions, but they also exposed the differences between the son of a librarian and the son of a lawyer. I'd been taught that a deal was a deal and your word was your bond. Bill was more flexible; he felt free to renegotiate agreements until they were signed and sealed. There's a degree of elasticity in any business dealing, a range for what might seem fair, and Bill pushed within that range as hard and as far as he could.

Microsoft was a high-stress environment because Bill drove others as hard as he drove himself. He was growing into the taskmaster who would prowl the parking lot on weekends to see who'd made it in. People were already busting their tails, and it got under their skin when Bill hectored them into doing more. Bob Greenberg, a Harvard classmate of Bill's whom we'd hired, once put in 81 hours in four days, Monday through Thursday, to finish part of the Texas Instruments BASIC. When Bill touched base toward the end of Bob's marathon, he asked him, "What are you working on tomorrow?"

Bob said, "I was planning to take the day off."

And Bill said, "Why would you want to do that?" He genuinely couldn't understand it; he never seemed to need to recharge.

Our company was still small in 1978, and Bill and I worked hand in glove as the decision-making team. My style was to absorb all the data I could to make the best-informed decision possible, sometimes to the point of over-analysis. Bill liked to hash things out in intense, one-on-one discussions; he thrived on conflict and wasn't shy about instigating it. A few of us cringed at the way he'd demean people and force them to defend their positions. If what he heard displeased him, he'd shake his head and say sarcastically, "Oh, I suppose that means we'll lose the contract, and then what?" When someone ran late on a job, he had a stock response: "I could code that in a weekend!"

And if you hadn't thought through your position or Bill was just in a lousy mood, he'd resort to his classic put-down: "That's the stupidest fucking thing I've ever heard!"

Good programmers take positions and stick to them, and it was common to see them square off in some heated disagreement over coding architecture. But it was tough not to back off against Bill, with his intellect and foot tapping and body rocking; he came on like a force of nature. The irony was that Bill liked it when someone pushed back and drilled down with him to get to the best solution. He wouldn't pull rank to end an argument. He wanted you to overcome his skepticism, and he respected those who did. Even relatively passive people learned to stand their ground and match their boss decibel for decibel. They'd get right into his face: "What are you saying, Bill? I've got to write a compiler for a language we've never done before, and it needs a whole new set of run-time routines, and you think I can do it over the weekend? Are you kidding me?"

I saw this happen again and again. If you made a strong case and were fierce about it, and you had the data behind you, Bill would react like a bluffer with a pair of threes. He'd look down and mutter, "O.K., I see what you mean," then try to make up. Bill never wanted to lose talented people. "If this guy leaves," he'd say to me, "we'll lose all our momentum."

Some disagreements came down to Bill and me, one-on-one, late at night. According to one theory, we'd installed real doors in all the offices to keep our arguments private. If that was true, it didn't work; you could hear our voices up and down the eighth floor. As longtime partners, we had a unique dynamic. Bill couldn't intimidate me intellectually. He knew I was on top of technical issues—often better informed than he, because research was my bailiwick. And unlike the programmers, I could challenge Bill on broader strategic points. I'd hear him out for 10 minutes, look him straight in the eye, and say, "Bill, that doesn't make sense. You haven't considered x and y and z."

Bill craved closure, and he would hammer away until he got there; on principle, I refused to yield if I didn't agree. And so we'd go at it for hours at a stretch, until I became nearly as loud and wound up as Bill. I hated that feeling. While I wouldn't give in unless convinced on the merits, I sometimes had to stop from sheer fatigue. I remember one heated debate that lasted forever, until I said, "Bill, this isn't going anywhere. I'm going home."

And Bill said, "You can't stop now—we haven't agreed on anything yet!"

"No, Bill, you don't understand. I'm so upset that I can't speak anymore. I need to calm down. I'm leaving."

Bill trailed me out of his office, into the corridor, out to the elevator bank. He was still getting in the last word—"But we haven't resolved anything!"—as the elevator door closed between us.

I was Mr. Slow Burn, like Walter Matthau to Bill's Jack Lemmon. When I got mad, I stayed mad for weeks. I don't know if Bill noticed the strain on me, but everyone else did. Some said Bill's management style was a key ingredient in Microsoft's early success, but that made no sense to me. Why wouldn't it be more effective to have civil and rational discourse? Why did we need knock-down, drag-out fights?

Why not just solve the problem logically and move on?

Philanthropy - Bill and Melinda Gates Foundation

Main article: Bill & Melinda Gates Foundation

Gates with Bono, Queen Rania of Jordan, former British Prime Minister Gordon Brown, President Umaru Yar'Adua of Nigeria and others during the Annual Meeting 2008 of the World Economic Forum

Gates studied the work of Andrew Carnegie and John D. Rockefeller, and donated some of his Microsoft stock in 1994 to create the "William H. Gates Foundation." In 2000, Gates and his wife combined three family foundations and Gates donated stock valued at $5 billion to create the charitable Bill & Melinda Gates Foundation, which was identified by the Funds for NGOs company in 2013, as the world's wealthiest charitable foundation, with assets reportedly valued at more than $34.6 billion.[93][94] The foundation allows benefactors to access information that shows how its money is being spent, unlike other major charitable organizations such as the Wellcome Trust.[95][96] Gates, through his foundation, also donated $20 million to Carnegie Mellon University for a new building to be named Gates Center for Computer Science which opened in 2009.[97][98]

Gates has credited the generosity and extensive philanthropy of David Rockefeller as a major influence. Gates and his father met with Rockefeller several times, and their charity work is partly modeled on the Rockefeller family's philanthropic focus, whereby they are interested in tackling the global problems that are ignored by governments and other organizations.[99] As of 2007, Bill and Melinda Gates were the second-most generous philanthropists in America, having given over $28 billion to charity;[100] the couple plan to eventually donate 95% of their wealth to charity.[101]

The foundation is organized into five program areas: Global Development Division, Global Health Division, United States Division, and Global Policy & Advocacy Division. Among others, it supports a wide range of health projects, granting aid to fight transmissible diseases such AIDS, tuberculosis and malaria, as well as widespread vaccine programs to eradicate polio. It grants funds to learning institutes and libraries and supports scholarships at universities. The foundation established a water, sanitation and hygiene program to provide sustainable sanitation services in poor countries.[102] Its agriculture division supports the International Rice Research Institute in developing Golden Rice, a genetically modified rice variant used to combat vitamin A deficiency.[103] The goal of the foundation is to provide 120 million women and girls, in the poorest countries, with high-quality contraceptive information and services, with the longer-term goal of universal access to voluntary family planning.[104] In 2007, the *Los Angeles Times* criticized the foundation for investing its assets in companies that have been accused of worsening poverty, pollution and pharmaceutical firms that do not sell to developing countries.[105] Although the foundation announced a review of its investments to assess social responsibility,[106] it was subsequently canceled and upheld its policy of investing for maximum return, while using voting rights to influence company practices.[107]

Personal donations

Melinda Gates suggested that people should emulate the philanthropic efforts of the Salwen family, who sold their home and gave away half of its value, as detailed in their book, *The Power of Half*.[108] Gates and his wife invited Joan Salwen to Seattle to speak about what the family had done, and on December 9, 2010, Bill and Melinda Gates and investor Warren Buffett each signed a commitment they called the "Giving Pledge", which is a commitment by all three to donate at least half of their wealth, over the course of time, to charity.[109][110][111]

Gates has also provided personal donations to educational institutions. In 1999, Gates donated $20 million to the Massachusetts Institute of Technology for the construction of a computer laboratory named the "William H. Gates Building" that was designed by architect Frank Gehry. While Microsoft had previously given financial support to the institution, this was the first personal donation received from Gates.[112]

The Maxwell Dworkin Laboratory of the Harvard John A. Paulson School of Engineering and Applied Sciences is named after the mothers of both Gates and Microsoft President Steven A. Ballmer, both of whom were students (Ballmer was a member of the School's graduating class of 1977, while Gates left his studies for Microsoft), and donated funds for the laboratory's construction.[113] Gates also donated $6 million to the construction of the Gates Computer Science Building, completed in January 1996, on the campus of Stanford University. The building contains the Computer Science Department and the Computer Systems Laboratory (CSL) of Stanford's Engineering department.[114]

Since 2005, Gates and his foundation have taken an interest in solving global sanitation problems. For example, they announced the "Reinvent the Toilet Challenge", which has received considerable media interest.[115] To raise awareness for the topic of sanitation and possible solutions, Gates drank water that was "produced from human feces" in 2014 – in fact it was produced from a sewage sludge treatment process called the Omni Processor.[116][117] In early 2015, he also appeared with Jimmy Fallon on *The Tonight Show* and challenged him to see if he could taste the difference between this reclaimed water or bottled water.[118]

In November 2017, Gates said he would give $50 million to the Dementia Discovery Fund, a venture capital that seeks treatment for Alzheimer's disease. He also pledged an additional $50 million to start-up ventures working in Alzheimer's research.[119] Bill and Melinda Gates have said that they intend to leave their three children $10 million each as their inheritance. With only $30 million kept in the family, they are expected to give away about 99.96% of their wealth.[120] On August 25, 2018, Gates distributed $600,000 through his foundation via UNICEF which is helping flood affected victims in Kerala, India.[121]

Interview: Bill Gates, Co-Founder and Chairman, Microsoft Corporation - March 17, 2010, Seattle, Washington

Source - [HW003P][GDrive]

Could you tell us briefly talk about your vision for the Bill & Melinda Gates Foundation? Early on you gave a great deal to libraries and schools, now global health seems to be a larger focus.

Bill Gates: The Foundation got started in the late '90s, with my dad -- encouraging me -- an executive named Patty Stonesifer, **who'd left Microsoft, were helping out**. I was still very busy, our kids were very young, but we got going. We put computers in libraries in many different countries, including the United States. We did some scholarship things. We were learning about reproductive health and population issues. And that kept growing, and we met people who knew about vaccines. So it was a part-time thing. Global health was a bit over half; the U.S.-focused libraries, scholarship education work was over a quarter; and it was a final piece that relates to other things to help the poorest, other than just health things, things like finance and savings. And you know, it grew. And then I saw that I could make a unique contribution there, and created a transition plan that was four years in the making. So now I'm full time at the Foundation and playing a role of being the Chairman and traveling a lot. So it's equally challenging, it's very fulfilling. It's taking these resources that I'm lucky enough to have, because of the success of Microsoft, and giving those back to the society in a way that can have the biggest impact.

In your priorities for the Foundation, discovery is one of the first. That's interesting, because it is kind of a parallel to Microsoft. So even in the area of medicine, and vaccines fighting malaria and so forth, you're still focused on discovery.

Bill Gates: Absolutely. We need new vaccines, we need cheap vaccines, we need vaccines that are easy to deliver, even in the poorest places, where something like having refrigerators is tough to do. And it does connect to my experience at Microsoft of finding great scientists, making sure they understand the problems that are important, getting them focused on those things, having milestones, even if there are setbacks, and making sure that -- if the possibility is still there -- that they get the proper backing. This is something that governments don't do much of. They fund a lot of the great delivery -- the foreign aid is very, very important -- but on the discovery side there's been a deep under-investment. Whether it's a malaria vaccine, tuberculosis vaccine, about 20 different diseases that -- if things go well -- we'll have vaccines for most of those within the next decade. So the Foundation is really taking the lead, financing that scientific work, and already some have been discovered. Some are getting out there, but there's a lot more still to be done

---

2015 (December) Geekwire INTERVIEW: BILL GATES TALKS ABOUT HIS DAD'S INFLUENCE ON HIS LIFE, THE TECH COMMUNITY AND THE WORLD

Source - [HM000H][GDrive]

Bill Gates : My dad's not an engineer or scientist. He never really got exposed to that stuff. And so he always said he wished he'd known more about that. That wasn't the exposure he had. My dad is not big on regrets. There's really very little in his life that he would regret…. Of course, when my mother passed away [in 1994], that was a very sad thing. Within a few years, my dad was helping out with the [Bill & Melinda Gates] Foundation. He then met Mimi and was lucky enough to get married to her. That has been a great thing for him.

GeekWire: Speaking of the foundation, what skills and strengths did he bring to the foundation that really have made him effective here?

Bill Gates: He and Patty Stonesifer [former co-chair and CEO of the foundation] brought together what initially were fairly small-scale efforts. That was great. In terms of the tone, the principles and things, my dad was quite fantastic. Patty had been an executive at Microsoft, was very capable about setting up the organization….

[In 2000] I put in $20 billion and so then the foundation had a minimum payout of a billion dollars a year. So they had to grow pretty quickly. That's gone up. Then we had the [Warren] Buffett gift that doubled our resources. My dad's role initially was very hands-on. As we got bigger, he stayed strongly involved in the community stuff. He stayed more involved in the education, the U.S.-focused stuff.

He did some international trips. I remember he and Jimmy Carter did this great trip to South Africa. That's one of my favorite photos of my dad. He, Jimmy Carter and Nelson Mandela holding these babies. He went down to Honduras.

It's fair to say he was way more focused and stayed more engaged in the domestic stuff. He loves the international stuff, he did some work related to that. But he was pretty tilted. He was really super knowledgeable about the Seattle-area stuff and quite knowledgeable about the U.S. stuff. As the global stuff became more scientific, like the malaria vaccine or something like that, he was super supportive, but that was not his hands-on area.

(2014, Dec) - Time Magazine - Person(s) of the Year ... The Ebola Scientists

Thomas Geisbert, 52 : Virologist who conducted the first trials of the drug TKM-Ebola

Source - [HP0055][GDrive]

During the 1990s, a biowarfare expert named Ken Alibek defected from the Soviet Union and testified to Congress that the Soviet Union had been working on developing Ebola as a weapon. I was a virologist, and I was working at U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID) in western Maryland, not far from where I grew up. At the time, the only biosafety level 4 (BSL4) labs in the U.S. were at the CDC and USAMRIID, and there was interest from the Department of Defense to study Ebola. We certainly were doing things to develop different countermeasures like vaccines, treatments, and we were trying to understand the virus.

That got us to a point—to the point of taking some of the better ideas and showing that they worked or didn't work. But that's where it stopped. There wasn't money or interest or time to take those products across the finish line.

But I've never been somebody who toes the line. I just looked at Ebola as a challenge. I'm not the kind of scientist who sits at a desk. I've got to be in the middle of it, in the space suit in the lab, in the thick of it. When I do this work, I take it personally. You go through all those times when it doesn't work, it doesn't work, it doesn't work, and it's so frustrating, so mentally draining, so demeaning, physically and mentally.

But after 9/11, everything changed. There was increased funding. It was fortunate for me, because Ebola was my main area of interest. When all the money became available, we started looking at developing a vaccine. The idea came from Heinz Feldmann, then at the Public Health Agency of Canada (now at the National Institute of Allergy and Infectious Diseases), and the first big success we had was in 2002 or 2003. We did two back-to-back studies, and this was the first vaccine that completely protected monkeys from Ebola.

Everything about the disease in monkeys is so much like in humans. So even though you can't say for 100% it's going to work in humans, you know the odds are 99% that if it works for monkeys, it will probably work for people.

I remember walking in that room where I was used to seeing dead monkeys, and five, six, seven, eight, twelve—all the monkeys are healthy, no signs of disease. In my field and what I do, that's the greatest feeling you can imagine.

When I started doing some of the first studies [on drug treatments] in the '90s, I would get excited because something I tried worked in guinea pigs or mice or something. Then you'd get excited: "Oh man, this is going to be great." But there's a quantum leap from rodents to nonhuman primates like monkeys. It turns out rodents aren't very good models for Ebola infection. All of a sudden you do it in monkeys, and all of the monkeys died. We had so many failures in the 1990s. It was a terrible feeling.

I've got shelves and shelves and shelves and shelves of stuff that slow or inhibit growth of Ebola in culture. Dozens of those protect mice or guinea pigs. Only two worked in nonhuman primates, out of all the studies done in the BSL4 lab—and those are ZMapp done by Gary Kobinger in Canada and TKM-Ebola, which I worked on with biotech company Tekmira.

When you do have success, like when we did the TKM-Ebola study, there is no greater feeling. There is no greater feeling than walking in when you know it's going to work, you've got healthy animals—that feeling is awesome. When we did our first study with TKM-Ebola on monkeys, I was like, It would be good if we get 50% protection, it's a home run. I didn't expect 100% protection.

In this Ebola outbreak, we know at least four to five people got the TKM drug, and all have survived. But we don't want to say the drug was the reason they survived. While we hope they helped in patients, we can't say for sure because the patients got so many other things. There are so many confounding variables, so how can you say any one thing made the difference?

But it's a great feeling knowing I was involved in the development of something that hopefully saved somebody. And if it saved one person, it matters. —as told to Alice Park

A History of Savannah and South Georgia

See [HB002B][GDrive]

*REUBEN GEISE. A former highly respected resident of Dawson, the late **Reuben Geise** was for many years successfully engaged in the lumber business, and contributed his full share in advancing the industrial interests of this part of Terrell county. A son of **George Adam Geise, Jr.,** he was born, September 8, 1821, in Newmanstown, Pennsylvania, of substantial German ancestry.*

His paternal grandfather, George Adam Geise, Sr., was born, June 4, 1725, in Hanover, Germany, and was there bred and educated. At the age of twenty-nine years he came to America in the good ship "Peggy," and located in Bern township, Pennsylvania. He there bought land, and was engaged in farming until his death, June 29, 1784. He proved himself loyal to his adopted country, bravely assisting the colonists in their struggle for independence. He married Barbara Haag, who was born in Berks county, Pennsylvania, July 31, 1738, and there died in August, 1814, having survived him thirty years.

***George Adam Geise, Jr.,** was born in Bernville, Berks county, Pennsylvania, **June 17, 1772**. He married April 15, 1797, **Susanna Bright**, who was born in Bern township, Berks county, a daughter of John and Anna Maria (Leis) Brecht, as the name was then spelled, though it was later changed to Bright, and a granddaughter of David Brecht. Her great-grandfather, Stephen Brecht, emigrated from Germany to America in colonial times, coming to this country a widower with three small children. Settling in Lancaster county, Pennsylvania, he bought a tract from three Pennbrothers, John, Thomas and Richard, the land having been a part of their original grant. David Brecht, whose birth occurred in the Fatherland, September 8, 1719, was one of the three children that came with his father to this country. He served in the Revolutionary army, after which he resumed farming at his old home in Berks county, residing there until his death, September 22, 1783. John Brecht, or Bright, as he spelled his name, and his wife were both life-long residents of Berks county, his death occurring February 9, 1834, and hers on May 24, 1842. -*

George Adam Geise, Jr., and wife were also life-long residents of their native county. He died March 29, 1858, while her death occurred October9,1856. Both were buried in the Lutheran cemetery, at Newmanstown, Pennsylvania. They were the parents of fourteen children, and when her death occurred they had sixty-three grandchildren, and twenty-nine great-grandchildren.

While a boy in his teens, Reuben Geise joined his brother George, in Tuscumbia, Alabama. Learning the trade of a miller, he subsequently built a flour mill at Big Spring, Tuscumbia, Franklin county, and operated it as a merchant mill. Being thus employed during the war between the states, he was exempted from military duty, but during the last year of the conflict he entered the Confederate service, and was assigned to duty in the transportation of leather. He went with the army from Dixon Station, Alabama, to Rome, Georgia, from there refugeeing to Dawson, Georgia. At the close of the war, Mr. Geise established a saw mill in Dawson, and embarked in the lumber business, subsequently furnishing the Central Georgia Railroad Company with lumber. Meeting with well merited success, he continued in the lumber business until his death, October 25, 1880.

Reuben Geise married Jerusha Halsey Wood, who was born in Huntsville, Alabama, November 16, 1831, a daughter of Lewis Wood. Her paternal grandfather, Joseph Wood, was born in Newark, New Jersey, October 14, 1760, of English lineage. He was well educated, and taught school in different places in his native state, and also served as a soldier in the Revolutionary war. He married April 2, 1780, Joanna Tuttle, whose birth occurred June 12, 1762. He was a personal friend of George Washington, with whom he served as a soldier. Lewis Wood was born in Newark, New Jersey, April 10, 1794, and as a young man migrated to Richmond, Virginia, from there going to Huntsville, Alabama, where he resided until his death, in 1836. Lewis Wood married, in Huntsville, Alabama, February 27, 1822, Mary Ann Woods, who, though of the same name, was not a relative. Her father,Leighton Wood, third, was a native of Richmond, Virginia, a son of Leighton Wood, second, who was born in England, in the city of Bristol, where his father, Leighton Wood, first, was, as far as known, a life-long resident. Leighton Wood, second, immigrated to America, and settled in Virginia, where he fought with the colonists in their struggle for independence. Elected auditor of Hanover county, Virginia, in 1780, he served from May until November, of that year, when the Virginia assembly elected him solicitor general, an office which he filled most efficiently until 1791. In 1801 he returned to England, and there died in 1805. He married a daughter of Rev. Benjamin Franklin Blagrove, an Episcopalian rector, and chaplain of the Virginia assembly in 1781.

Leighton Wood, third, served in the War of 1812. He married Mary Younghusband, whose father, William Younghusband, a resident of Richmond, Virginia, served as a soldier in the Revolutionary war, while her grandfather, Isaac Younghusband, was captain of a company of soldiers in the same war. After his marriage, Leighton Wood, third, went with his wife to Kentucky, where his death occurred. His widow subsequently moved to Huntsville, Alabama, where she spent her remaining days. -

Mrs. Reuben Geise passed to the higher life September 3,1 885. To her and her husband five children were born and reared, namely: Owen Nelson, Mary Wood, Susie Bright, James Deshler, and Rushie Lee. Mary Wood is the wife of D.J. Ray, of Atlanta, Georgia. Susie Bright married Walter S. Dozier, of whom a brief sketch may be found else where in this biographical work. Rushie Lee is the widow of Charles Wood Gunnell, of whom a brief sketch also appears in this volume. Mrs. Walter S. Dozier is a genealogist, and to her the Geise and Dozier families are greatly indebted for their family histories, she having devoted much time in searching records, and in corresponding with members of the different branches of both families.

The **GE-600 series** was a family of 36-bit mainframe computers originating in the 1960s, built by General Electric (GE). When GE left the mainframe business the line was sold to Honeywell, which built similar systems into the 1990s as the division moved to Groupe Bull and then NEC.

The system is perhaps best known as the platform on which the Dartmouth Time Sharing System (DTSS) spent most of its life, and the base machine for the Multics operating system as well. Multics was supported by virtual memory additions made to later versions of the series.

Architecture[edit]

The 600 series used 36-bit words and 18-bit addresses. They had two 36-bit accumulators, eight 18-bit index registers, and one 8-bit exponent register. It supported floating point in both 36-bit single-precision and 2 x 36-bit double precision, the exponent being stored separately, allowing up to 71 bits of precision (one bit being used for the sign). It had an elaborate set of addressing modes, many of which used indirect words, some of which were auto-incrementing or auto-decrementing. It supported 6-bit and 9-bit bytes through addressing modes; these supported extracting specific bytes, and incrementing the byte pointer, but not random access to bytes.

It also included a number of channel controllers for handling I/O. The CPU could hand off short programs written in the channel controller's own machine language, which would then process the data, move it to or from the memory, and raise an interrupt when they completed. This allowed the main CPU to move on to other tasks while waiting for the slow I/O to complete, a primary feature of time sharing systems.

Operating systems[edit]

Originally the operating system for the 600-series computers was GECOS, developed by GE beginning in 1962. Between 1963 and 1964, the first version of the Dartmouth Time Sharing System (DTSS) was developed on the GE-235. DTSS was the first truly useful time sharing system and was very influential in the market. It is also the platform where the BASIC programming language was first developed. The Computer History Museum's Corporate Histories Collection describes GE's Mark I history this way[1]:

The precursor of General Electric Information Services began as a business unit within General Electric formed to sell excess computer time on the computers used to give customer demos. In 1965, Warner Sinback recommended that they begin to sell time-sharing services using the time-sharing system (Mark 1) developed at Dartmouth on a General Electric 265 computer. The service was an instant success and by 1968, GEIS had 40% of the $ 70 million time-sharing market. The service continued to grow, and over time migrated to the GE developed Mark II and Mark III operating systems running on large mainframe computers.

The GE Mark II operating system (later Mark III) was used by GE Information Services as the basis for its timesharing and networked computing business. Although Mark II / Mark III was originally based on the Dartmouth system, the systems quickly diverged. Mark II/III incorporated many features normally associated with on-line transaction-processing systems, such as journalization and granular file locking. In the early-to-mid-1970s, Mark III adopted a high-reliability cluster technology, in which up to eight processing systems (each with its own copy of the operating system) had access to multiple file systems.

The Multics operating system was begun in 1964 as an advanced new operating system for the 600 series, though it was not production-ready until 1969. GE was hardware supplier to the project and one of development partners (the others were Massachusetts Institute of Technology and Bell Labs). GE saw this project as an opportunity to clearly separate themselves from other vendors by offering this advanced OS which would run best only on their machines. Multics required a number of additional features in the CPU to be truly effective, and John Couleur was joined by Edward Glaser at MIT to make the required modifications. The result was the **GE-645**, which included support for virtual memory. Addressing was modified to use an 18-bit *segment* in addition to the 18-bit address, dramatically increasing the theoretical memory size and making virtual memory much easier to support.

History[edit]

The GE-600 line of computers was developed by a team led by John Couleur out of work they had done for the military MISTRAM project in 1959. MISTRAM was a radar tracking system that was used on a number of projects, including Project Apollo. The Air Force required a data-collection computer to be installed in a tracking station downrange from Cape Canaveral. The data would eventually be shared with the 36-bit IBM 7094 machine at the Cape, so the computer would likely have to be 36-bits as well. GE built a machine called the M236 for the task, and as a result of the 36-bit needs, it ended up acting much like the 7094.

GE originally had not intended to enter the commercial computer market with their own machine. However, by the early 1960s GE was the largest user of IBM mainframes,[*citation needed*] and producing their own machines seemed like an excellent way to lower the costs of their computing department. In one estimate, the cost of development would be paid for in a single year free of IBM rental fees. Many remained skeptical, but after a year of internal wrangling, the project to commercialize the M236 eventually got the go-ahead in February 1963.

The machine was originally offered as the main **GE-635**, and the slower but compatible **GE-625** and **GE-615**. While most were single-processor systems, the 635 could be configured with four CPUs and up to four input/output controllers (IOC's) each with up to 16 Common Peripheral Interface Channels. The 635 was likely the first example of a general purpose SMP system, though the GECOS/GCOS software treated the processors as a master and up to three slaves.

In August 1964, IBM considered the GE 600 series to be "severe competition in the medium and large-scale scientific areas".[2] In May 1965 the first GE-625 computer was delivered to the GE Schenectady plant to replace five other computers of various sizes and makes.[3] A number of GE 635's were shipped during 1965 including two to Martin Marietta in November.[4]

The 600 line consisted of six models: the 605, 615, 625, 635, 645, and 655. GE offered a box to connect to the 635 called a 9SA that allowed the 635 to run 7094 programs.

The 615 was a 635 with Control Unit (CU) and Operations Unit (OU) overlap disabled, and a 36-bit-wide memory path. The 625 was a 635 with Control Unit and Operations Unit overlap disabled and 72-bit-wide memory path. The 635 had a 72-bit-wide memory path and CU/OU overlap enabled. The difference between these models was fewer than 10 wires on the backplane. Field service could convert a 615 to a 635 or 625 or vice versa in a couple of hours if necessary; other than those few wires, the 615, 625 and 635 were identical. The 605 was used in some realtime/military applications and was essentially a 615 without the floating point hardware. Programs coded for a 605 would run without any modification on any other 600 line processor. The 645 was a modified 635 processor that provided hardware support for the Multics operating system developed at MIT.

The 605/615/625/635 and 645 were essentially second generation computers[*citation needed*] with discrete transistor TTL logic and a handful of integrated circuits. Memory consisted of a two-microsecond ferrite core, which could be interleaved. GE bought core memory from Fabri-Tek, Ampex and Lockheed. The Lockheed memory tended to be the most reliable.[*citation needed*]

Continuing problems with the reliability of the magnetic tape systems used with the system cast a pall over the entire project. In 1966 GE froze many orders while others were cancelled outright. By 1967 these problems were cleared up, and the machines were re-launched along with an upgraded version of the GECOS operating system.

A follow-on project to create a next-generation 635 started in 1967. The new **GE-655** replaced the individual transistors from the earlier models with integrated circuits, which doubled the performance of the machine while also greatly reducing assembly costs. However, the machine was still in development in 1969, and was announced but probably never delivered under that name.

By that time the Multics project had finally produced an operating system usable by end-users. Besides MIT, Bell Labs, and GE, GE-645 systems running Multics were installed at the US Air Force Rome Development Center, Honeywell Billerica, and Machines Bull in Paris. These last two systems were used as a "software factory" by a Honeywell/Bull project to design the Honeywell Level 64 computer.

GE sold its computer division to Honeywell in 1970, who renamed the GE-600 series as the Honeywell 6000 series. The 655 was officially released in 1973 as the **Honeywell 6070** (with reduced performance versions, the 6030 and 6050). An optional Decimal/Business instruction set was added to improve COBOL performance. This was the Extended Instruction Set, aka EIS and the Decimal Unit or DU. The machines with EIS were the 'even' series, the 6040, 6060, 6080 and later the 6025. Several hundred of these processors were sold. Memory was initially 600 ns ferrite core made by Lockheed. Later versions used 750 ns MOS memory. The two could co-exist within a system, but not within a memory controller.

A version of the 6080 with the various Multics-related changes similar to the 645 was released as the **6180**. A few dozen 6180-architecture CPUs were shipped. Later members of the 6000 series were released under various names, including Level 66, Level 68, DPS-8, DPS-88, DPS-90, DPS-9000 by Honeywell, Groupe Bull, and NEC.

from GECOS to GCOS8
an history of Large Systems in GE, Honeywell, NEC and Bull

a view by Jean Bellec (FEB), from the other side of the Atlantic

Part I- General Electric

General Electric was in the early 60s the largest private user of IBM computers. GE had no intent of considering electronic computers as one of its strategic segments. However a decentralized management structure allowed the hyper frequencies lab to enter the computer field through a bid for the checks sorter shop at Bank of America. (ERMA project). That was the beginning of the Computer Department established at Phoenix AZ.

GE also embarked in the process control computer business through the GE-312 that evolve later into GE-225 and into GE-265 (Dartmouth Time-Sharing System). The first direct entry of GE in the general purpose computer business was a 24-bits machine code-named Mosaic that was introduced in 1963 as GE-400. However, the upper model planned for GE-400 was hardly competitive with the just announced IBM/360.

Origin of GE-600

A solution to the performance problem of the "Y" model of the GE-400 came from a project initiated outside the Computer Department , in the Military Department that had developed a computer for the US Air Force Cape Canaveral Missile Range, called M236 and installed at Eleuthera (Bahamas). That computer was a 36-bits computer due to the computation requirements of radar tracking and to the required exchange of data with IBM 7094 located at the Cape. The chief architect of the M-236 was John Couleur who will become later a technical leader of the GE Large Systems.

The debate in favor or against a M236-derived general purpose computer took more than one year and concluded finally with the victory of the M2360 project proponents in February 1963. The GE upper management was impressed by the perspective of saving the rental fees from IBM leased equipment used internally by GE (the cost of development of the new project was estimated to be offset by only one year of rentals). The other GE departments were not very impressed and were reluctant to jettison their IBM machines.

GE-625

According to the initial plan, the central processor was to be designed at Syracuse, NY and the Input-Output Controller in Phoenix, with peripheral subsystems common to the GE-400 line. The product line took the name of **GE-600** initially with two system versions with different clock values, the **GE-625** and the **GE-635**. The software would have been developed in Phoenix with people brought from various user departments. Eventually, the processor's team migrate from Syracuse to Phoenix, while the technology team remained for a while in Syracuse.

The main innovation of GE-600 was the creation of a SMP **Symmetric Multi-Processing** platform, probably the first actually built in the world. While, at that time, much talk was about the reliability of a redundant system, the main advantage was different: SMP was limiting the development cost to a single design for building a line covering a range of power that would had needed probably three designs (as IBM did at that time).

In 1964, GE decided to take over Olivetti computer assets and the majority of Compagnie des Machines Bull of France. The expected value of those acquisitions was to establish an international European base for the general purpose computers. Both the GE-400 and the GE-600 were to be sold by the two European subsidiaries of General Electric.

The first GE-600 introduced in Europe was a GE-635 sold to ASEA in Sweden before the Bull-GE merger. ASEA (now part of ABB) was a General Electric licensee and used the GE-600 for scientific applications.

After jettisoning its RCA licenses, Bull was selling many GE-400 systems and started to market the GE-600 over its original market. It got a contract for the billing of Electricité de France , the largest power utility in the world, that required COBOL, while the compiler was still in its infancy in Phoenix. It required far more reliability from magnetic tapes than GE was then providing. GECOS II was an operating system that was optimizing batch processing (without an attached processor, as were at that time organized many IBM shops) and remote-batch (using Univac 1004 or GE-115 small computers as terminals). It supported multiprogramming but not very efficiently.

In 1964-1966, But obtained contracts for around a dozen of GE-600. But eventually, the EDF contract collapsed and Bull-GE froze its ordering of GE-600, waiting the solution of the technical problems that finally were sorted out in 1968.

During that period, Bull-GE made studies, in conjunction with Phoenix, of a small version de GE-600, code-named Q2, that proposed a micro-programmed version of the 600. The project was cancelled when GE was no more sure of pursuing the GE-600 line.

GECOS II

The initial GE-600 systems were using **GECOS-II** operating system, a multiprogramming batch oriented system, based upon large (specifically IBM 7090) users requirements of that time. Thanks to the multiprogramming facilities of the OS, there was requirements for supplemental I/O converters (à la 1401)

and remote batch was supported with initially Univac 1004 as terminals.

Programming Languages were:

- GMAP macro assembler
- FORTRAN II
- COBOL 61
- that was announced and "delivered" far before being qualified. in 1965
- JOVIAL
- for an USAF contract

Files on tape and discs supported sequential and random organizations (GEFRC) and IDS was being announced.

The insufficient quality of GECOS-II associated to the poor reliability of the magnetic tapes lead, in October 1966, to as suspension of the promotion of GE-600 in the United States and of is sales by General Electric, some orders were cancelled, other delayed and the future of GE-600 was somber.

GECOS III

The operating system kernel was redesigned, adding also a time-sharing system (TSS) extending the functions of the Dartmouth Time Sharing System on the GE-265. It became **GECOS III** and was well accepted by existing customers. Introduced in 1968, while MULTICS was still in its infancy, no commonality was envisioned between GECOSIII and MULTICS.

GECOS III was advertised as a multidimensional system, adding to batch and remote-batch, the time-sharing and direct-access "dimensions". The architecture of GECOS III will not be significantly altered in the future versions of GCOS.

The new operating system, announced in 1967, gave the opportunity to re-launch the marketing of the 635 line and in Europe several new large orders were secured (Credito Italiano, l'Union) specially for large business applications. Bull lost the scientific market to Control Data, Univac and IBM but succeeded to make an honorable stand in the non-scientific market.

In the US, GE succeeded to secure a large order from US Air Force for its Worldwide control & command system (WWMCCS). Some modifications to improve the security of GECOS III were developed as specials for that order, but the existence of this multi-year contract was securing the durability of the product line. A few WWMCCS systems were installed in Germany.

GE-655

The technology of the GE-635 was based on discrete transistors (Sylvania SUHL). Printed circuits were not fully used and the manufacturing cost of a system was high. A single processor system represented three large cabinets not including peripherals.

A first improvement was brought in 1967, when a new model with an integrated circuits technology was designed by the Syracuse team of GE. Its performances were better than those of the 635 and the manufacturing cost lower. It was introduced as the **GE-655** at a price significantly higher than that of the 635.

GECOS-IV

GECOS-IV was a project developed in Central research Laboratory in Schenectady in 1967 under the direction of Robin Kerr. Their goal was to integrate GECOS, the work at Dartmouth and the their DESKSIDE project. GECOS-IV required a modified CPU to provide a "virtual machine" capability. It also challenged a strength of GECOS-III, its time-sharing capability.

Mark-III and General Electric Information System

In 1964, GE had helped the Dartmouth College NH to develop an interactive system for teaching programming. The hardware was a GE-200 front-ended by a communication processor developed initially for store and forward communication messages the GE Datanet-30. The terminals were AT&T Teletype 33 ASCII typewriters connected through 300 bauds Bell modems.

The Dartmouth College, perhaps inspired from MIT CTSS, had developed a special purpose operating-system including an interpretive processor of the BASIC (Beginner's All Symbolic Instruction Code) language also created for this system, christened GE-265.

General Electric started to market the BASIC service, through a special division that took over the maintenance of the Dartmouth College software. As the hardware perspective of the GE-200 was limited, the Dartmouth College accepted the GE offer of porting the DTSS (Dartmouth Time-Sharing System) to the GE-600. GE started to replace its GE-265 by GE-635 as Mark-III systems.

The hardware of Mark-III system was originally completely standard, but the software was developed and maintained independently from Phoenix. General Electric Computer Division and its affiliates (e.g., Bull General-Electric) were not entitled to license their customers with Mark-III software.

Mark-III systems main center was concentrated in Cleveland OH, but expanded with a center in Amsterdam, the Netherlands. The customers of the timesharing service were connected transparently to the computer centers.

With Mark-III, the applications were expanded to email and batch applications. Eventually, GE added to the base systems several IBM 370 computers to provide batch services without recompiling applications to the peculiarities of GE-600 code (differences in scientific operations precision in particular.

GE ISD was later instrumental in the evolution of Honeywell Large Systems by pushing Phoenix to use IBM and IBM compatible peripheral subsystems on the DPS-8 product line. GEISD had developed since the early 70s their own versions of peripheral subsystems shared between Honeywell and IBM computers and pressured Honeywell to introduce a standard facility.

After acquisition of the GE computer business by Honeywell in 1970, General Electric kept the timesharing business in an Information Services Division

that is still alive. The ISD European Operation was momentarily kept inside Honeywell-Bull, but was retroceded to GE circa 1975.

Toshiba

Toshiba Corporation was a licensee of General Electric in Japan and also using the computer licenses of the GE-600. The Japanese , at the end of the 1960s, started to design their low-end version of the GE-600. They used obviously integrated circuits and designed a micro-programmed execution unit. Under the provisions of cross-licensing, Toshiba's design was later brought back in Phoenix under the ELS (entry level system) code name.

In 1973, Datamation reported, from information apparently collected from Richard Bloch that In 1969, John Haanstra, somewhat skeptical about the results of the Shangri-La task force attempted to establish as a parallel effort or as a back-up effort a project, to be done in cooperation with Toshiba that would have closed the gap between the GE-400 and the GE-600 product lines. It would have been a dual-personality machine operating in GE-400 as a 3xGE-435. The death of John Haanstra in August 1969 would have suspended the project.

[I have been unable to find a person who in Phoenix or in Bull had the knowledge of the Pi project, so I would be interesting to know more about it. For the time being, I am unable to confirm or to infirm its existence. JB]

GE APL advanced product line

Around the end of 1967, however, IBM S/360 was starting to submerge its competitors and GE had to recognized that its set of product lines covered few segments with a competitive edge.

John Haanstra (who headed several IBM technical departments) was hired by GE to design a plan to replaces current product lines by a new Advanced Product Line (APL). Forces from Paris, Milano and Phoenix started to work together on that project. The revival of the GE-600 did not materialize before 1969 and the APL did not target the still embryonic park.

GE choose a new (CML) technology for APL, what was somewhat premature .

John Haanstra left APL to head the Phoenix computer department, were he brought impulses from the APL project, such as 9-bits PSI channels, microprogrammed peripheral subsystems that improved the GECOS offering for many years to come.

After a new attempt by GE to redefine a new product line (in a 4 months meeting named Shangri-La in summer of 1969), the GE management finally decided in April 1970 to sell its Computer Department. **Honeywell** was the buyer of all the assets (including Phoenix as well as the European subsidiaries)

[HB006B][GDrive]

I used to believe that the "cancer conspiracy" was an unintentional result of the love of money and that there were really no malicious intentions at its roots. However, due to stories like the three that follow, I believe that I was a bit naïve in my initial assessment of the situation.

In 1931, [Dr. Cornelius Packard "Dusty" Rhoads (born 1898)], a pathologist from the Rockefeller Institute for Medical Research, purposely infected human test subjects in Puerto Rico with cancer cells, and thirteen of them died. Despite the fact that Rhoads gave a written testimony stating he believed all Puerto Ricans should be killed, **he later established the U.S. Army Biological Warfare facilities in Maryland, Utah and Panama, and was named to the U.S. Atomic Energy Commission, where he began a series of radiation exposure experiments on American soldiers and civilian hospital patients**.

Then, in 1963, Chester M. Southam (who injected Ohio State Prison inmates with live cancer cells in 1952) performed the same procedure on twenty-two senile, African-American female patients at the Brooklyn Jewish Chronic Disease Hospital in order to watch their immunological response. He told the patients that they were receiving "some cells," but conveniently left out the fact that they were cancer cells. Ironically, Southam eventually became president of the American Association for Cancer Research!

In 1981, the **Seattle-based** Genetic Systems Corporation began an ongoing medical experiment called "Protocol No. 126" in which cancer patients at the **Fred Hutchinson Cancer Research Center** in Seattle were given bone marrow transplants that contained eight experimental proteins made by Genetic Systems, rather than standard bone marrow transplants. As a result, 19 human "subjects" died from complications directly related to the experimental treatment. "Hutch employees" ... "Fred Hutch" -> https://en.wikipedia.org/wiki/Fred_Hutchinson_Cancer_Research_Center <- U Washington + Bill Gates connection

marketing begins, typically during Phase III studies. Treatment INDs also allow the FDA to obtain additional data on the drug's safety and effectiveness.

Protocol No. 126 is an example of what happens when IRBs are composed of colleagues, cronies, and individuals who are either professionally intimidated by physicians or have a financial stake in the research they are overseeing. We've already seen examples of how results are manipulated and how dangerous or ineffective products have been approved and brought to market. The clinical trials Becky Wright had "volunteered" for allegedly without knowing all the facts should never have gotten past Phase I, and they should have been halted before Becky even boarded the plane in Heflin, Alabama.

The investigation by the *Seattle Times* uncovered some stunning facts and fatal flaws. Half the recipients of the experimental bone marrow transplants suffered from a disease that was at worst 5–10 percent fatal. However, researchers wanted to increase transplantation success rates by using newly developed antibodies to help boost the immune system, destroy foreign material, and fight infection. According to the published reports, participants were not told that some of them had a 60 percent chance of lifetime survival with standard therapy! A majority of the Human Subjects Review Board were Hutch employees and the Hutch had a stake in the company's success. Despite that, many of the board members initially rejected Protocol No. 126 because of inadequate preliminary animal studies, a proposal to use the healthiest rather than the sickest patients, and the informed consent form, which downplayed the risk of the experimental treatment and failed to inform patients that a second transplantation (in case the first one failed) carried a 95 percent risk of failure.

After Protocol No. 126 was revised to reduce the strength of the drugs, the committee approved the research without knowing that FHCRC had a financial interest in the research and that three of the eight antibodies used in the treatment were developed by researchers who had a financial stake in the company that produced them. Dr. Robert Nowinski, a friend of David Blech and the head of Genetic Systems, had struck a deal with FHCRC to acquire exclusive commercial rights to thirty-seven antibodies for twenty years in exchange for substantial royalties on sales. The sale gave both parties an incentive to do whatever they could to get the products through the FDA approval process and into the marketplace.

[...]

For example, in July 1963, after receiving funds from the U.S. Public Health Service and the American Cancer Society, researchers at the Jewish Chronic Disease Hospital sat in their offices and made their final selections regarding who would be injected with live human cancer cells. This was not some prison laboratory facility at Auschwitz; it was a New York hospital preparing to subject humans to Nazi-like experiments nearly twenty years after the defeat of Germany and three years after the election of John F. Kennedy in what was described as the dawn of a new society. During the 1965 court case against the hospital (258 N.Y.S.2d397), it must have seemed like déjà vu for Jews who'd seen it all before and sat horrified at the thought that it had happened at a Jewish hospital no less.

The testimony, at times chilling, was a reminder that such things were still very much possible. Patients with and without cancer had been chosen without their consent for a study to determine not only if foreign cancer cells would live longer in debilitated noncancer patients than in patients with cancer, but if cancer could actually be induced by injection of live cells. The subjects were not told that the intradermal injections contained live cancer cells because, as the doctors explained, they (the doctors) "did not wish to stir up any unnecessary anxieties in the patients who had phobia and ignorance against cancer." Although the doctors claimed that "oral consent" was given, hospital administrators later tried to cover up the fact that many of the subjects were physically and mentally unable to give consent or that the consent had been fraudulently obtained after the injections were already administered. To add insult to injury, the American Cancer Society elected the study's principal investigator as the vice president of their organization.

The same type of cancer injections were also given to three hundred healthy women at Memorial Sloan-Kettering Cancer Center.

According to Jay Katz, author of Experimentation with Human Beings , gynecology patients were injected with cancer without their knowledge in order to determine how the body would respond to an invasion of live cancer cells. During testimony, several doctors admitted that they believed the injected cells might cause cancer years later but injected them anyway. The reason for performing the experiment on nonconsenting subjects was obvious. Who in their right mind would willingly consent to being injected with cancer?

Less than twenty years later, the lessons of Puerto Rico and New York had been all but forgotten, and history, as it often does, repeated itself once again. For a little more than a thousand miles to the north in Heflin, Alabama, Becky Wright had been offered a chance at a unique cancer therapy that guaranteed she'd live long enough to see her children grow old.

A housewife and mother of three, Becky Wright believed the doctors when they told her that the treatment she was about to receive at the Fred Hutchinson Cancer Research Center (FHCRC) would save her life. Though apprehensive during her flight to Seattle, Washington, Becky figured that the experts knew best. Her sister, after all, was a perfect bone marrow donor match, and the biotechnology company conducting the experimental clinical trials, Genetic Systems Corporation, was supposedly on the threshold of a cancer breakthrough.

According to the Seattle Times , Genetic Systems was started by [David Abraham Blech (born 1955), a twenty-four-year old song writer and entrepreneur who'd convinced investors that the 1980s biotech boom would make them all rich beyond their wildest dreams. The only expertise the

entrepreneur who'd convinced investors that the 1980s biotech boom would make them all rich beyond their wildest dreams. The only expertise the Brooklyn native had when he began his fledgling startup was his extraordinary sales charisma and his ability to recruit physicians for what promised to be a "pioneering institution in transplanting bone marrow." And what Becky Wright traveled more than three thousand miles across the country for was to become one of organized medicine's modern day guinea pigs.

By the time Becky arrived at the research center, plans had been made to forego standard transplant treatment and instead add eight experimental proteins made by Genetic Systems to her sister's bone marrow. **According to the Seattle Times report, the oncologists, as well as the FHCRC, had significant financial ties to Genetic Systems and had a vested interest in testing the proteins and using the cancer patients as human subjects.** In fact, two of the doctors involved in the experiments owned one hundred thousand and two hundred and fifty thousand shares of company stock. After the initial treatment, researchers crossed their fingers and hoped for a miracle because they certainly hadn't had much success up until then.

There wasn't much doubt about the risks and dangers involved in the experiment known as Protocol No. 126. **Even worse, during initial consultations with doctors, Becky and Pete Wright allegedly were never told that the treatment Becky would be receiving hadn't worked in other patients.** Investigators for the Seattle Times wrote, "Transplants were being rejected at alarming rates. New cancers were appearing and old ones reappearing far more than they normally would. All were problems directly attributable to the experimental treatment." According to the newspaper's account, not a word was ever said about the dozen or so patients who had already died or about the financial links between the doctors treating Becky, the research center, and [David Abraham Blech (born 1955)]. And it wasn't until Becky Wright eventually died, along with nineteen other human subjects, that Dr. John Pesando, a member of a committee to protect patient's rights, began publicly questioning the safety of the treatments and the ethics of the experiments.

Concerned that humans were being used as nothing more than test animals, even while better and more effective treatments were available, Dr. Pesando tried to warn federal officials about what was happening. "Many patients died at the Fred Hutchinson Cancer Research Center when the Institutional Review Board charged with protecting them was shamelessly used and abused by senior staff," he wrote. "Hutch management denied the existence of financial conflicts of interest, refused to halt the protocols, and refused to have protocols reviewed by independent outside examiners."

What disturbed Dr. Pesando most was that doctors involved in the research effectively controlled the review board set up to ensure patients' safety. Rather than living by the Hippocratic Oath they'd taken to "abstain from every voluntary act of mischief and corruption," some physicians allegedly failed to make full disclosure to reviewers and board members of their financial interest in the research.

In a letter sent by Dr. Pesando to the National Institutes of Health (NIH), Pesando reported that senior clinicians conducted clinical trials with high therapy-induced mortality rates while they were major stockholders in the company with commercialization rights to those therapies. "It soon became obvious that at least one FHCRC clinical study (Protocol No. 126) involving MAb was causing very high mortality rates in patients who otherwise stood a good chance of cure by bone marrow transplantation," he wrote. "Final numbers are unavailable, but it is safe to say that protocol 126 was directly responsible for at least two dozen patient deaths … . A great many people, then as now, simply will not make the personal sacrifices currently required to even attempt to correct abuses of this kind, even when human lives are at stake. Thus similar abuses are all but guaranteed to continue."

It was obvious from Dr. Pesando's letter that he believed Protocol No. 126 was continued in the hope of financial gain and despite the mounting death toll caused by the experiments, a charge that the physicians involved have denied. More than two years went by without a response from NIH. A second letter from Pesando, this one to Donna Shalala, secretary of health and human services under President Bill Clinton, went even further. "More than twenty patients were killed at the FHCRC by their NIH-sponsored physicians in pursuit of profit, yet there could hardly be less concern if laboratory rats had died instead. At the FHCRC, economic and professional self-interests were clearly best served by silence or complicity, but the NIH's silence appears to arise either because it is unable to accept the fact that leading medical researchers are capable of such behavior or because it is unwilling to face the consequences of accepting the truth."

What really shocked Pete Wright after his wife's death was learning that even in the 1980s and 1990s, doctors, in the name of science or simply for financial gain, were still effectively using humans as subjects of medical research even when they allegedly knew that alternative established therapies were available. The case of Genetic Systems is likely just the tip of the iceberg because with hundreds of millions invested in pharmaceutical research and billions riding on new biotech products, the pressure to test drugs and get them to market is simply too great.

As we've already seen, by the time human subjects are recruited for experimental treatments, the assumption is that the drug is safe. The problem is that with so many new companies being formed, and so many researchers and doctors having a financial stake in the outcome of new products, the review process—often done by individuals with financial interests as well—becomes tainted. Furthermore, each step in the review and approval process can be manipulated because it's often based on the honor system. Reviewers simply believe the data they're presented and accept what the researchers tell them.

THE WHISTLEBLOWER

He saw the tests as a violation of 'trusting, desperate human beings'

FOR NEARLY two decades, Dr. John Pesando sounded the alarm over what he saw as a dangerous and unethical human experiment at Seattle's Fred Hutchinson Cancer Research Center.

In the 1980s, he complained from the inside: As a member of an oversight committee at "The Hutch," he repeatedly objected to the clinical trial in which leukemia patients were dying at unusually high rates.

In the 1990s, he complained from the outside: In letter after letter - to members of Congress, to federal and state agencies, to newspapers - he said "many good people needlessly lost their lives" in the leukemia experiment, which lasted from 1981 to 1993.

"Trusting, desperate human beings were used as laboratory rats," he wrote to state authorities in 1994. "One should not assume that these patients would have soon died anyway because they had cancer, and that it was therefore not possible to do any harm. Many of these patients were correctly told that they could expect cure rates of approximately 50 percent (with standard treatment) ...

"Real people lost their lives, and there was no way to stop it."

What happened

A timeline of doctors' complaints and officials' responses.

For the most part, Pesando was received as Hutchinson Center officials have portrayed him: a disgruntled former employee with an ax to grind. But a Seattle Times investigation supports most of his allegations and finds his concerns shared by some of the most respected cancer doctors in the Northwest.

Seventeen years passed between the time Pesando and other doctors first objected to Protocol 126, as the experiment was labeled, and yesterday's revelations in The Times of deaths, misleading assurances and potential financial conflicts surrounding the experiment.

In those years, the doctors' complaints were largely rebuffed, rejected or ignored. Finally, under incessant pressure from Pesando, they were taken up by federal and state agencies but never fully investigated.

Underlying all of this, Pesando and other doctors believe, was a reluctance to challenge an institution as respected and powerful as the Hutchinson Center. That reluctance was all the greater because one of the people behind Protocol 126 was Dr. E. Donnall Thomas, a Hutch co-founder and co-winner of the 1990 Nobel Prize in Medicine.

As Pesando puts it: "They were all afraid of taking on the 800-pound gorilla."

Experiment already under way

Harley Soltes / The Seattle Times

A snapshot of Ruth Fisher who died in January 1984 after a graft failure and second transplant

John Pesando came to Seattle and The Hutch in 1982 as a 36-year-old magna cum laude graduate of Harvard University with a medical degree and Ph.D. from the Albert Einstein College of Medicine in New York. Pesando was board-certified in oncology and internal medicine; his research focused on tumor immunology. He had taught at Harvard and had worked for four years as a cancer doctor and researcher at the Dana Farber Medical Center in Boston.

At Harvard, Pesando had discovered an important antibody marker in tracking and treating leukemia, and conducted the first-ever clinical trial with a monoclonal antibody, treating five leukemia patients.

He was recruited to The Hutch by one of its co-founders, Dr. Rainer Storb. Soon after joining the staff, Pesando was asked by his bosses to serve on the

Center's Institutional Review Board.

That board was required by federal law to review all proposed human experiments at The Hutch. Its members were to ensure that risks to patients were minimized in relation to potential benefits, and that patients fully understood those risks before agreeing to participate in clinical trials.

Pesando was reluctant to take on the unpaid duty of policing his colleagues, some of whom were in a position to affect his future. But he believed deeply in the need for such policing, he says, so he swallowed hard and served.

Also joining the review board was a new chairman, Dr. Henry Kaplan, from Seattle's Swedish Medical Center, where some Hutch patients were treated. He is now one of the Northwest's most highly regarded oncologists.

From their first days on the board together, Pesando and Kaplan were concerned about Hutch researchers using unproven new antibody drugs.

In Protocol 126, researchers were testing antibodies to see if the elimination of certain cells in the blood, called "T-cells," would make bone-marrow transplants safer. The researchers theorized that killing off the T-cells in the marrow of donors before injecting it into patients would help stave off a troublesome complication known as graft-versus-host disease, or GVHD.

The experiment was directed by Don Thomas; Dr. John Hansen, head of a tissue-matching lab and later clinical director; and Dr. Paul Martin, a young oncologist. The trial was funded by the National Cancer Institute.

From the time the experiment was first brought to the oversight committee early in 1981, some committee members had challenged it, saying:

- The science behind the experiment was dubious. While mice benefited, some felt there had been inadequate prior research on dogs before moving on to tests in humans.
- Some thought T-cell removal might actually prevent donated bone marrow from engrafting, or taking hold in the recipient's bones, and some thought it might open the way for the return of the cancer.
- While GVHD was bothersome and uncomfortable, it was seldom fatal. And the proposed subjects of Protocol 126 - those with siblings whose tissue type matched theirs - were the least likely to get it. Besides, there were other ways to effectively treat GVHD.
- Unlike most cutting-edge medical research, Protocol 126 proposed experimenting on the healthiest, rather than the sickest, patients. Committee members saw no need to subject those patients to undue risk.
- The "informed-consent" form for the experiment - the required document outlining risks for patients - was misleading.

Despite all these concerns, the previous oversight board had approved the experiment in April 1981. By the time Pesando and Kaplan joined the board, the experiment was well under way.

Financial conflicts of interest

Within their first few months on the Institutional Review Board (IRB), the new members suspected that Protocol 126 wasn't working. Patients enrolled in the experiment were dying - including some people who otherwise would be expected to live.

Kaplan and Pesando raised many of the same questions their predecessors had on the medical and scientific aspects of the experiment. They received lots of assurances but no answers.

Meanwhile, a new concern emerged: Rumors were rampant in hospital hallways that the researchers - Thomas, Hansen and Martin - all had financial interests in Genetic Systems, the Seattle biotechnology company that owned rights to some of the drugs being tested in the experiment.

When Kaplan asked Hutch officials about the rumors, he was told the researchers had no financial conflicts. What he was not told was that not only did those researchers all hold stock in Genetic Systems, they all held advisory or actual working positions with the company. Nor was he told that The Hutch itself had stock in Genetic Systems.

"We didn't even know which investigators were connected with which companies," Kaplan recalls now. "We never got the opportunity to ask about the decision-making process. I guess the fair thing to say was John (Pesando) was absolutely convinced there was a problem, and the rest of us thought there was enough to raise questions about. They were not answered satisfactorily in the time I was on the board."

Meanwhile, the early stages of Protocol 126 were proving a failure, and patients were dying - some, apparently, as a direct result of the experiment. Among the dead were two patients Pesando himself had treated.

When their two-year terms on the Institutional Review Board ended in 1985, Kaplan and Pesando were told again by the president of The Hutch, Dr. Robert Day, that their concerns about both medical and ethical problems with Protocol 126 would soon be addressed.

They trusted that assurance, and went on to focus on their careers. Kaplan built one of the most successful private oncology practices in the Northwest; last year, he was the cover subject of a Seattle Magazine feature entitled "Top Doctors."

Career hits a snag

Pesando, meanwhile, went about trying to land a long-term position doing cancer research at The Hutch. That didn't happen. In 1987, his contract expired and was not renewed. Storb says Pesando "didn't work out. He was removed by Don (Thomas) for a number of reasons. I agreed with them. He was not an active member. He led a sheltered life. He was very paranoid about sharing data. He didn't bring in grants. He left under poor circumstances."

Pesando has another explanation: his run-ins with Thomas and the other people behind Protocol 126. He recalls Thomas confronting him after one particularly tense session, barking: "Who the hell are YOU to question what we do here?"

(Thomas refused to be interviewed by The Times for the articles running this week.)

Pesando doesn't deny that he struggled at The Hutch. He says that was because he was unable to get support from his bosses for research he proposed.

He tried unsuccessfully for a time to find a good position elsewhere in his specialty areas of leukemia and lymphoma - "They (would) go to The Hutch for recommendations" - then decided to take another path. He began working as a consultant for the Social Security Administration and for biotechnology companies.

He and his wife settled into a hundred-year-old Victorian home on Capitol Hill and raised their daughter

He and his wife settled into a hundred-year-old Victorian home on Capitol Hill and raised their daughter.

Over the years, Pesando tried to put Protocol 126 out of his mind. He might have succeeded, had he not picked up a book entitled "Magic Bullets" in 1991. In it, Seattle author Grant Fjermedal describes the invention of new antibodies to seek out and destroy cancer.

Among the companies Fjermedal wrote about was Genetic Systems. He outlined the company's relationship with The Hutch and its doctors, and quoted Day, Hutch president, on why such financial interplay was a positive factor in medical research, not a negative.

Pesando was incensed to see this apparent confirmation of what he and Kaplan had suspected all along: that Protocol 126 was driven not only by science but also by money. And Day's position was a signal that nothing had changed.

Pesando contacted Fjermedal, a longtime science and medical writer, who was struck by Pesando's knowledge of the situation and by his passion.

"What you've got in this guy is a rarity," Fjermedal said in a recent interview. "You've got somebody who has the credentials. He's seen all this, he's on the inside, and he's coming forward. That's very, very rare."

Fjermedal encouraged Pesando to take his complaints to the proper authorities.

For the rest of the decade, that's precisely what this lonely warrior did - only to be repeatedly frustrated.

Federal agencies take a look

President Day successfully defended The Hutch, but in the end a state official said, 'There still remained some doubt in our mind.'

Pesando began firing off letters in various directions in 1991. He wrote to members of Congress, to federal and state agencies, even to The New York Times.

Finally, a letter to the federal Office of Protection from Research Risks (OPRR), a unit of the Department of Health and Human Services, caught someone's attention.

"Basically," Pesando wrote, "senior clinicians at the Fred Hutchinson Cancer Research Center in Seattle conducted clinical trials with high therapy-induced mortality rates while they were major stockholders in the company with commercialization rights to those therapies."

Admitting to feeling "much anger," Pesando concluded, "The seriousness of this issue and its implications for future patient care continue to make it very difficult for me to take the expedient course of doing nothing."

In May 1993, the OPRR opened an investigation of the case. Thomas Puglisi, chief of the agency's compliance department, assigned investigator Kamal Mittal.

Mittal got Pesando's permission to use his name, and three months later, sent a copy of Pesando's letter to Day, the Hutchinson Center president.

Two months after that, Day responded with a 24-page letter and 2-inch stack of attachments. In that package, he defended The Hutch and its researchers vigorously.

He insisted that a successful outcome to Protocol 126 would not have benefited Genetic Systems or its stockholders - ignoring the fact that some of the chemicals being tested were licensed to Genetic Systems, and that the very existence of the experiment had increased the company's value.

He insisted that any risks "were fully disclosed to and discussed with the patients." However, the consent form underplayed the risk of graft failure and failed to mention the likely outcome - death - if a second transplant were necessary.

He insisted that the IRB had the power to address any concerns - ignoring the fact that Pesando and Kaplan had pushed for an outside review.

And he insisted that concerns about conflicts of interest "were addressed promptly" by a policy adopted by the Hutch Board of Trustees in March 1983. That policy barred employees from participating in research in which they or a family member had an economic interest of any type. However, the policy was not enforced and resulted in no changes in Protocol 126. In fact, Hansen and Martin say they were never told about it.

(Day, who retired as Hutch president in 1997, refused to be interviewed by The Times for the articles running this week.)

The Hutch also hired the best medical-ethics defense lawyer at the then-biggest law firm in Washington, D.C.: Barbara Mishkin of Hogan & Hartson, who phoned Puglisi and met with Mittal briefly.

Pesando had no opportunity to respond to Day's claims. He called the OPRR several times to offer help and information but never heard back.

Frustrated, he went to the top, writing to Health and Human Services Secretary Donna Shalala. The result: more frustration.

Pesando did receive a response, from Wendy Baldwin, acting deputy director for extramural research at the Public Health Service. Baldwin wrote that she recognized "the very serious nature of the issues you have raised" and promised to review the case.

But that promise was an empty one, e-mail released to The Times under the Freedom of Information Act shows.

That e-mail, between Puglisi of the OPRR - the actual author of the letter signed by Baldwin - and Dr. George Galasso of the National Institutes of Health, indicates that top federal officials had already decided there was "nothing wrong" with conflict-of-interest issues in Protocol 126. An e-mail from Galasso suggests they send it to another office as "sort of CYA (cover your ass)."

Investigation is dropped

Meanwhile, other federal documents show, the primary investigator, Mittal, was far from convinced there was no problem. He had several pointed questions he wanted to ask Hutch officials:

- Did the IRB feel compromised or strong-armed?
- Was the risk/benefit ratio in favor of the patients?
- Were patients fully and correctly informed of risks?
- Did the doctors violate the conflict-of-interest policies? (Mittal added: "Answer appears to be yes!")
- Was it proper to develop products with federal funds that would profit a private company and doctors?

"To get answers to these questions, it may be necessary to arrange a site visit to speak with various individuals including the members of the IRB at the time period in question," Mittal wrote.

But then Mittal, who'd been brought in as temporary help, asked to be transferred to another job and was removed from the case.

"I left it almost in the middle," Mittal recalls.

Pesando's complaint lay untouched in Washington, D.C., for a year after that.

"It was just a matter of our workload being overwhelming at the time," Puglisi said.

The OPRR was absorbed in a fertility-clinic scandal in California. It was chronically understaffed. At one time it had about 70 open investigations being conducted by one full-time professional staff member and two or three part-timers, the House Committee on Government Reform found.

Eventually, Pesando and Day both wrote, separately, to ask for a progress report. Puglisi assigned a senior staffer, William Dommel, to write a report based on information in the file, nearly all of it provided by The Hutch.

That report, dated Sept. 5, 1995, and signed by Puglisi, concluded that the complaint was "unsubstantiated" and that The Hutch was not at fault since its own Institutional Review Board had failed to stop the activities. The OPRR blamed the Hutch IRB for not doing more to stop the study.

The federal investigators never interviewed Pesando or Kaplan, both of whom had tried to stem the study, or any other IRB members.

They never interviewed Thomas, Hansen, Martin, Day or any other Hutch officials.

They never interviewed any of the families of the trial subjects.

They never asked for a single tape of a single IRB meeting, nor ever spoke with a single outside expert on the risks of T-cell depletion and second transplants.

Pesando was stunned.

He wrote again to HHS Secretary Shalala and to Harold Varmus, director of the National Institutes of Health. Steam rose from his rhetoric.

"In late 20th century America, prominent physicians at a major cancer center knowingly risked the lives of unsuspecting patients in pursuit of financial gain, successfully bypassed regulatory bodies, and repeatedly silenced opposition. ... Yet there could hardly be less concern if laboratory rats had died instead."

He called the investigation "arrogant, chilling and totally unacceptable."

Shalala and Varmus never replied. Baldwin of the Public Health Service wrote to Pesando on their behalf.

"After careful examination of the OPRR's findings, I am convinced that the investigation was exhaustive and conducted with objectivity and due consideration for the rights and welfare of human subjects involved in research," Baldwin wrote.

A fax obtained by The Times, however, suggests there was no such "careful examination" by Baldwin. Instead, it shows that Dommel - the very person who wrote the findings about which Pesando was complaining - had drafted the response for Baldwin to sign.

Pesando wrote to Varmus again: "The NIH's handling of this matter suggests that it was afraid of finding something, and the profound apathy of those at the top to misconduct in the field helps to explain why such problems exist."

This time, Pesando got no response.

State panel takes on the case

While he was waiting for Washington, D.C., to act, Pesando took his crusade to Washington state officials.

He wrote to Dr. Larry Bryce, chairman of the state Department of Health's Medical Quality Assurance Commission, in December 1994, repeating his complaint:

"In essence, financial conflict of interest led to highly unethical human experimentation which resulted in at least two dozen patient deaths. Oversight committees were misled, lied to, and kept uninformed while in an atmosphere of fear and intimidation ...

"I have done my part, and more, to correct this problem. I would like to see someone else show some interest."

The state commission showed some interest in the complaint but decided to wait for the federal findings.

Nine months after federal officials dropped the case, the state opened its own investigation. In June 1996, a year and a half after Pesando's filing, the case was assigned to Dr. Robert Miller, physician staff member of the state commission, and investigators James Smith and Bill Crowell.

Their investigation went much further than the feds' had. They interviewed Hutch officials, Kaplan and Pesando.

Kaplan had forgotten many details of his own role by then. For instance, he said he wrote one letter of objection, rather than the three The Times has found, and received just "a one-sentence letter of reply" from Thomas, rather than the lengthy missives Thomas, Day and Dr. Frederick Appelbaum, head of The Hutch's clinical-research division, sent him in the mid-1980s.

The state investigators didn't interview the researchers involved but obtained written statements from Thomas and Hansen.

Thomas' letter, marked "CONFIDENTIAL," was his only written response since the flat denial of conflict in 1984.

"The decision as to whether or not these studies should or should not continue was not made by me," Thomas wrote.

Storb and Pesando say Thomas, though technically not a member of the review panels, was influential in continuing the studies.

"I have never exposed any patient to treatment risks for reasons which were not ethically and medically appropriate, and I did not do so in the matter into which you are inquiring," Thomas wrote.

In his letter, Hansen noted he was not the principal investigator on Protocol 126, and in fact had "no involvement" in it while working for Genetic Systems.

However, Hansen was named as the second author in several papers on the clinical trial. He was Martin's mentor and supervisor. And he received copies of

all the key correspondence from The Hutch even while he was working at the private company holding commercial licenses for the antibodies.

In September 1997, with the case still unresolved, Miller left the state Medical Quality Assurance Commission and its investigating team.

With his departure, this investigation died.

The commission closed the complaint, citing "no cause for action," in January 1998, three years after Pesando's letter.

Miller says he was "saddened and alarmed" by the lack of follow through.

At a minimum, he said in an interview, the commission should have acted on ethical violations by Thomas and Hansen for influencing a study of materials licensed to the company in which they owned stock.

"To me, what Dr. Thomas did and the other doctor did was a clear conflict of interest," Miller said in an interview. "I think that's a pretty obvious, well-known ethical principle."

Dr. David Williams, an internist who chaired the state Medical Quality Assurance Commission at the time, was one of two doctors who personally reviewed the case. He says now that he, too, was not satisfied with the outcome.

"There still remained some doubt in our mind," he said. "I was never truly satisfied that the protocol had been written in a manner that was truly appropriate."

'Just trying to do our duty'

Through it all - unresponsive bureaucrats, half-baked investigations, patronizing letters - John Pesando, now age 55, persisted. He was both haunted and motivated, he says, by the memory of two of his patients who died in the experiment - Ruth Fisher, a 40-year-old computer programmer from California, and Jacqueline Couch, a 32-year-old lawyer for the city of New York.

He took it personally when people died on his watch and when he was, in his view, pushed out of The Hutch for raising his voice in favor of ethics and patient safety.

His quixotic quest both frustrated and frightened his wife, Patricia, who worried about his reputation.

But he kept pushing. Pushing until he got the attention of reporters at The Seattle Times, who took up the investigation.

Survivors of patients who died in Protocol 126 are grateful for that persistence.

Pete Wright of Heflin, Ala., whose wife, Becky, died in 1987, said: "I might slough this off to sour grapes if I didn't know Dr. Pesando. But I have nothing but respect for him."

Wright says that while caring for his wife, Pesando never talked about conflicts of interest or research misconduct, though he did try to talk them out of enrolling in the experiment on medical grounds.

"We were not looking for trouble," Pesando said. "We were just trying to do our duty and take care of patients."

[**Dr. Robert Charles Nowinski (born 1945)**]

He joined The Hutch at age 30 to make "magic bullets" - antibodies that might zero in on cancer cells. He had high hopes and $500,000 in public funding.

After five years, recruited by entrepreneur [**David Abraham Blech (born 1955)**], Nowinski left to co-found Genetic Systems Corp. His Hutch connections were central: He negotiated the exclusive licensing rights to 37 antibodies from the center, sublicensing many to another company for $3.7 million.

Nowinski appointed [**Dr. Edward Donnall "Don" Thomas (born 1920)**], head of the clinical oncology program at The Hutch, to Genetic Systems' scientific advisory board, giving him 100,000 shares of stock at a penny a share. Dr. John Hansen of The Hutch was appointed the company's medical director and given 250,000 shares. Those shares were worth millions almost overnight.

Nowinski's own stock and options were worth $10 million when Bristol-Myers bought Genetic Systems for $294 million in 1986.

Nowinski moved on to co-found Icos Corp., turning back to The Hutch for a dozen hires. Icos, of Bothell, is conducting human tests on four drugs that may offer relief from multiple sclerosis, heart attacks, strokes, asthma and - perhaps most exciting for investors - impotence.

Nowinski also founded PathoGenesis Corp. of Seattle, which sold a treatment for cystic fibrosis. He paid $22,500 for stock now worth millions.

Next, he founded [**VaxGen, Incorporated**], in Brisbane, Calif., with Dr. Donald Francis, longtime director of the AIDS laboratory at the Centers for Disease Control. Nowinski owns $5.8 million in VaxGen stock. Now age 56, he resigned as chief executive three months ago (2001), citing unspecified health concerns.

EVIDENCE TIMELINE

1972 — Fred Hutchinson Cancer Research Center founded

See https://en.wikipedia.org/wiki/Fred_Hutchinson_Cancer_Research_Center

"The "Hutch," one of the comprehensive cancer centers nationwide, was established through the efforts of Dr. William Hutchinson, brother of baseball hero Fred Hutchinson, and Washington state's legendary U.S. Senator Warren Magnuson [https://en.wikipedia.org/wiki/Warren_Magnuson ... who in 1936 filled the seat of .. https://en.wikipedia.org/wiki/Marion_Zioncheck]. The Hutchinson Center is the technology foundation of many biotechnology companies in Washington State. " (Source : Washington State Life Science(.com) : [HI002S][GDrive])

WHY?

Magnuson was first elected to the House of Representatives in 1936, filling a vacancy caused by the sudden death of fellow Democrat Marion Zioncheck on August 7, 1936. In 1937, along with senators Homer Bone and Matthew Neely, Magnuson introduced the National Cancer Institute Act, signed into law by Franklin Roosevelt on August 5 of that year.[11] He was reelected in 1938, 1940, and 1942. After the Attack on Pearl Harbor, Magnuson was a staunch supporter of the U.S. war effort.[12]

Magnuson served most of his tenure in the Senate alongside his friend and Democratic colleague from Washington State, Henry M. "Scoop" Jackson. Stat notes - Warren G. Magnuson Health Sciences Building at the University of Washington's Health Sciences building complex was named in his honor in 1970.

- Warren G. Magnuson Clinical Center at the National Institutes of Health in Bethesda, Maryland is also named for Senator Warren Magnuson.

New discovery may help fight diseases

NEW YORK (AP) — New treatments for diseases from flu to malaria may be on the horizon with the announcement by Stanford University researchers of the manufacture of pure human antibodies, scientists say.

Antibodies are key elements in the body's defense against infection. They help the body recognize and attack specific germs.

Drs. Henry Kaplan and Lennart Olsson, a Danish researcher on leave at Stanford, have bred a hybrid cell line that makes antibodies and can be kept alive indefinitely in an artificial cell culture.

The work by Kaplan and Olsson caps a search by scientists around the world that began after British scientists Georges Kohler and Cesar Milstein learned in 1975 how to make mouse antibodies.

Mouse antibodies cannot be used in therapy for human diseases since the human body would reject them.

"The field is perched right now for exciting developments," said Dr. Robert Nowinski, director of the Tumor Virology Program at the Fred Hutchinson Cancer Research Center in Seattle, one of the many researchers working on related problems

1981-05-17-the-spokesman-review-spokane-wa-pg-a-21-clip-genetic-systems

The Spokesman-Review (Spokane, Washington) · 17 May 1981, Sun · Page 21

Seattle genetic firm seeking $6 million

SEATTLE (AP) — A Seattle-based firm called Genetic Systems Corp., involving medical researchers prominent in genetic engineering and research for treatment of cancer and venereal diseases, is trying to raise $6 million in a public stock sale to bankroll the new company.

The company hopes to produce kits to diagnose venereal diseases quickly. Using similar antibody technology, the firm might produce kits to treat CMV disease, which kills about 30 percent of bone marrow transplant patients and could treat pseudomonas, a major killer of burn patients.

The company would use some technology developed at Seattle's Fred Hutchinson Cancer Research Center.

The company plans to develop another kit that uses genetic technology to identify the identity of a father of a baby, providing a legal tool to be used in paternity cases.

The new company is budgeting $750,000 for a new laboratory, $600,000 on marketing and $2.2 million for research and development of antibody technologies.

The preliminary prospectus cautions that buying Genetic Systems stock is risky because of the maze of regulatory obstacles the company faces in marketing new medical goods.

For the public investors, it is an opportunity to take a high-risk gamble on an infant company in the the hot — and possibly very profitable — "biotechnology" industry.

Three million shares will be sold by D.H. Blair & Co Inc., New York investment bankers who specialize in start-up companies, and are likely to go to market before the end of this month.

The original investors paid an average 12 cents a share when they set up the company last winter. The public stock sale will provide a huge increase in the value of their shares, at least on paper.

The founder, scientific director and soon-to-be executive vice president of the new firm is Robert Nowinski, head of a cancer research group at the Hutchinson Center. Nowinski's group was the first in the nation to treat leukemia with artificial antibodies.

The center, a non-profit institute, has sold to the new company exclusive rights to antibodies already developed at Hutchinson. The center will get varying royalties, depending on who the buyer is.

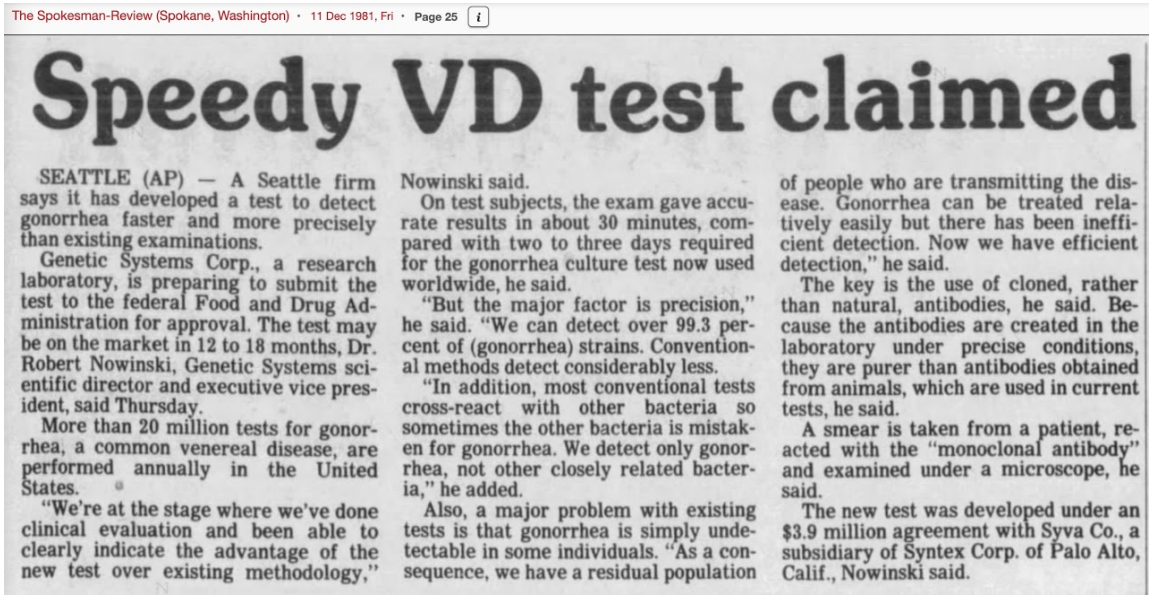
1981-12-11-the-spokesman-review-spokane-wa-pg-25-clip-vd-test



The Spokesman-Review (Spokane, Washington) · 11 Dec 1981, Fri · Page 25

Speedy VD test claimed

SEATTLE (AP) — A Seattle firm says it has developed a test to detect gonorrhea faster and more precisely than existing examinations.

Genetic Systems Corp., a research laboratory, is preparing to submit the test to the federal Food and Drug Administration for approval. The test may be on the market in 12 to 18 months, Dr. Robert Nowinski, Genetic Systems scientific director and executive vice president, said Thursday.

More than 20 million tests for gonorrhea, a common venereal disease, are performed annually in the United States.

"We're at the stage where we've done clinical evaluation and been able to clearly indicate the advantage of the new test over existing methodology," Nowinski said.

On test subjects, the exam gave accurate results in about 30 minutes, compared with two to three days required for the gonorrhea culture test now used worldwide, he said.

"But the major factor is precision," he said. "We can detect over 99.3 percent of (gonorrhea) strains. Conventional methods detect considerably less.

"In addition, most conventional tests cross-react with other bacteria so sometimes the other bacteria is mistaken for gonorrhea. We detect only gonorrhea, not other closely related bacteria," he added.

Also, a major problem with existing tests is that gonorrhea is simply undetectable in some individuals. "As a consequence, we have a residual population of people who are transmitting the disease. Gonorrhea can be treated relatively easily but there has been inefficient detection. Now we have efficient detection," he said.

The key is the use of cloned, rather than natural, antibodies, he said. Because the antibodies are created in the laboratory under precise conditions, they are purer than antibodies obtained from animals, which are used in current tests, he said.

A smear is taken from a patient, reacted with the "monoclonal antibody" and examined under a microscope, he said.

The new test was developed under an $3.9 million agreement with Syva Co., a subsidiary of Syntex Corp. of Palo Alto, Calif., Nowinski said.

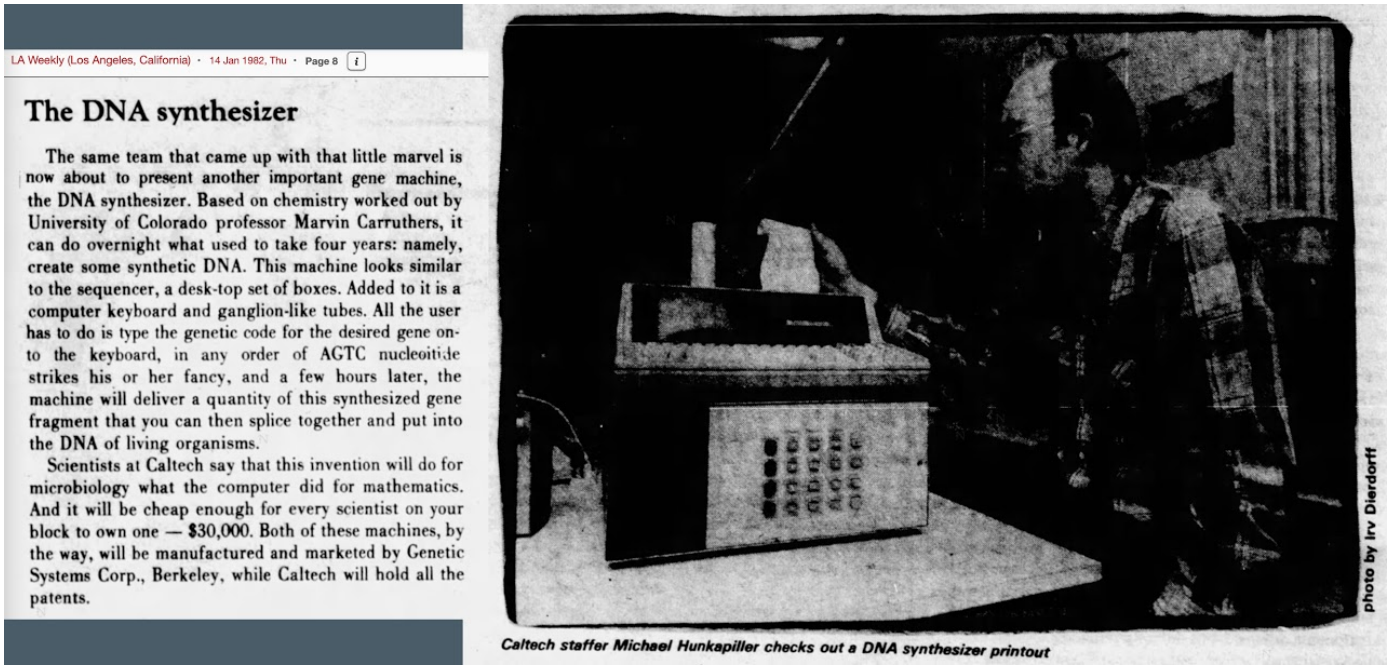
1982-01-14-l-a-weekly-pg-8-clip-dna-synthesizer



LA Weekly (Los Angeles, California) · 14 Jan 1982, Thu · Page 8

The DNA synthesizer

The same team that came up with that little marvel is now about to present another important gene machine, the DNA synthesizer. Based on chemistry worked out by University of Colorado professor Marvin Carruthers, it can do overnight what used to take four years: namely, create some synthetic DNA. This machine looks similar to the sequencer, a desk-top set of boxes. Added to it is a computer keyboard and ganglion-like tubes. All the user has to do is type the genetic code for the desired gene onto the keyboard, in any order of AGTC nucleotide strikes his or her fancy, and a few hours later, the machine will deliver a quantity of this synthesized gene fragment that you can then splice together and put into the DNA of living organisms.

Scientists at Caltech say that this invention will do for microbiology what the computer did for mathematics. And it will be cheap enough for every scientist on your block to own one — $30,000. Both of these machines, by the way, will be manufactured and marketed by Genetic Systems Corp., Berkeley, while Caltech will hold all the patents.

1982-02-10-the-spokesman-review-spokane-wa-pg-5-clip-genital-herpes

Spokane Chronicle, Wed., Feb. 10, 1982 5

New test developed for genital herpes

SEATTLE (UPI) — Scientists at Genetic Systems Corp. announced Tuesday they have developed a test that diagnoses genital herpes, a severe venereal infection, in only 45 minutes in comparison to the standard test that requires two or three days.

The development was announced by Dr. Robert Nowinski, scientific director of Genetic Systems, a pioneer in the new field of monoclonal antibody technology.

"Genital Herpes has become virtually epidemic," Nowinski said. "Approximately 10 million people are infected with the disease in the United State alone, and 400,000 to 600,000 new cases occur each year. With expected new treatments for herpes, the rapid and accurate diagnosis of this disease is becoming critically important."

Genetic Systems' test is performed by taking a patient specimen and directly reacting it with a monoclonal antibody. Presence of the herpes virus can then be readily identified under the microscope by the staining pattern of the cells.

Genetic Systems' monoclonal antibodies against herpes are part of the company's three-year $3.9 million product development and marketing agreement with Syva Co., a subsidiary of Syntex Corp.

Under the agreement, Genetic Systems, in conjunction with Syva, is developing a wide range of products for diagnosing venereal diseases, including herpes viruses, gonorrhea, chlamydia and syphilis.

These products, which require FDA approval, will be marketed by Syva under a joint Syva-Genetic Systems label.

Genetics for profit

Scientist mixes business with research

By BILL DIXON
Of the Statesman-Journal

It's one thing to be a pioneer in science and quite another to be a pioneer in business.

Robert Nowinski is trying to be both.

"The mix of my life has changed substantially," Nowinski said, "from being a pure scientist to being a business scientist. It's a very enjoyable mix."

Nowinski was in Salem on Friday to tell physicians at Salem Hospital Memorial Unit about the promise he sees for biotechnology in general and his company, Genetic Systems Corp. of Seattle, in particular.

Biotechnology makes it possible for man to replicate or enhance life processes. In Nowinski's case, that has meant the discovery and mass production of a kind of police force against disease.

Two years ago, Nowinski never would have made the trip to Salem — at least not as a salesman. Then, at the age of 34, he was a leader in antibody research with a professorship at the University of Washington and a budget of more than $600,000 a year.

That was before Nowinski helped found Genetic Systems in November 1980. Now he is the scientific director and executive vice president of an $8 million operation that has yet to sell a product on the open market.

The first Genetic Systems product, a diagnostic antibody for a venereal disease called chlamydia, will be out near the end of this year, Nowinski said. Starting next year the company will market a test for herpes that is faster and more accurate than current methods, he said.

And the company is working with Cutter Laboratories Inc. in Berkeley, Calif., to develop a treatment for pseudonomas, an antibiotic-resistant bacteria that is a major cause of death among burn and cancer victims.

In order for Genetic Systems to survive, Nowinski said, he has to split his time between research and business.

Nowinski's work revolves around monoclonal antibodies, one of the offshoots of a biotechnology revolution that began in the mid-1970s.

"Antibodies are natural molecules that our bodies make for defense," Nowkinski said. "They bind to the substances they are made against, so they can be used for identification. And they can inactivate the substances that they bind to."

The problem with antibody production, Nowinski said, is that each antibody works against only one substance, or antigen. But animals and humans, who are the breeding ground for the antibodies used by science, produce many antibodies at once. Until recently, there was no way to extract a specific antibody or mass produce it.

Since the antibodies had to come from living subjects, there was an inherent limit on how long any antibody might be available. Once the host died, you had to start all over again.

But in 1975, Nowinski said, two British researchers took a giant step toward solving those problems.

With their method, as in the past, a living host receives an injection of an antigen and responds by growing cells to produce antibodies. There the two paths separate.

Using the new method, cells are removed from the host's spleen and separated to obtain a batch of the specific antibody producers. Then those cells are fused with cancer cells in a mixture that contains polyethylene glycol, an ingredient of anti-freeze.

Nowinski said cancer cells are used because they are "immortal" — that is, unlike other cells, cancer cells will continue to grow indefinitely given the proper living conditions.

The spleen-cancer hybrid cells are selected and put into test tubes, where they reproduce without changing, or clone. If all goes well, the hybrid cells are then used to produce a single antibody. Hence the name monoclonal antibody.

So far, that part of Nowinski's work has gone well. In 1980 he and his research team at the Fred Hutchinson Cancer Research Center in Seattle were the first to use monoclonal antibodies to treat cancer in mice. Last year, the same team was among the first three in the world to demonstrate production of human monoclonal antibodies.

Making Genetic Systems profitable hasn't been an automatic process, but Nowinski said the signs are encouraging.

Despite a $400,000 loss its first year and a predicted loss of somewhere between $500,000 and $1 million this year, the company's policy of obtaining support before it starts to develop a product should stand it in good stead, Nowinski said.

The potential for developing products is tremendous, Nowinski said. Within 20 years, he said, biotechnology and genetic engineering will produce big advancements not only in medicine but also in agriculture and industry.

ROBERT NOWINSKI

But for now, a company like Genetic Systems still has to sell itself.

"We don't have a track record right now," Nowinski said, "but we're an exciting possibility."

[HN01J7][GDrive]

1983 (July 11) - NYTimes : "BIRTH OF A HEALTH-CARE CONCERN"

By N.r. Kleinfield, July 11, 1983, Section D, Page 1 / Source : [HN01IX][GDrive]

The New York Times/Doug Wilson

Robert Nowinski, left, scientific director of the Genetic Systems Corporation of Seattle, and James Glavin, the company's president.

[HN01IY][GDrive]

The formula for striking it rich used to involve oil wells. Then it was computers. Now the key phrase is health care. Michael Le Coney, a health-care analyst at Merrill Lynch, figures that there is no easier way to raise money than to start a healthcare company. At a clip of something like one a week, new entrants with big dreams and scant revenues are going public. Investors pounce. Stock prices soar. "Seemingly anybody can do it," Mr. Le Coney says. "It's beyond belief."

This is the story of how one health-care company - the Genetic Systems Corporation - sprang from a magazine article and a well-timed phone call and has begun to hit paydirt. The Blech Brothers

In the summer of 1980, [**David Abraham Blech (born 1955)**] was a 24-year-old stockbroker on Wall Street. His brother, Isaac, was 30, working in advertising and public relations. Any spare dollars they had, they gambled in hightechnology companies. Their stockpile of money grew. And so one inspired day, David Blech told his brother, let's start a company.

Health and health-care costs were already hot topics, so the Blechs were thinking health care. **About this time, Wall Street was responding enthusiastically to a new technology known as genetic engineering. Sounds good, the Blechs thought, but they felt they had to identify a "short-term hit," some aspect that could put a product on the market in a few years and thus show backers what the end of the rainbow looked like. As David Blech puts it, "We weren't Monsanto."**

One day he picked up a copy of The Sciences magazine and spied an article entitled ''Immortalizing Immunity'' that dealt with monoclonal antibodies. He didn't know what in the world they were. He read on.

Production of Antibodies

He found that antibodies are proteins produced by the human body to fight off invading organisms. They are valuable in detecting infections as well as in treating diseases. The recent development of so-called hybridoma technology, the article noted, allowed mass production of antibodies. By fusing cells that normally produce antibodies with tumor cells, hybrid cells are formed which are tantamount to little factories that continuously churn out highly defined strains known as monoclonal antibodies.

In the article, the author suggested that hybridoma technology could have an effect on medicine ''comparable to the transformation of electronics by the transistor.''

Lights flashed in David Blech's mind. ''When you've been on Wall Street for five years and you see an analogy like that,'' he recalled, ''you get excited.''

So the brothers hired the author of the magazine article, plus several other medical experts, to help them dig up a scientist as the nucleus of their company. Finding a Scientist

Robert Nowinski, an esteemed microbiologist immersed in monoclonal antibody work at the Fred Hutchinson Cancer Research Center in Seattle, drew repeated good comments. He had been mentioned in the Sciences article, since he had produced an antibody capable of curing mice of leukemia.

[THIS IS THE RESEARCH ... It was Nowinski's.. but why was he not mentioned ???
https://special.seattletimes.com/o/uninformed_consent/whistleblower/story1.html]

[David Abraham Blech (born 1955)] placed a call to Seattle. Curiously, around this time Mr. Nowinski was himself mulling over starting a company. Except what did he know about raising money? Mr. Nowinski would later say, ''Literally through a phone call, Genetic Systems was started.''

The New Yorkers and the Seattle scientist hit it off and agreed that a company built around Mr. Nowinski as scientific director would be a winner. Wary that the Blechs might not be able to raise adequate money, Mr. Nowinski set milestones to test their mettle. Within six weeks, they had to have $1 million in hand. Within six months, the kitty had to be $3 million to $4 million.

A crucial fact the Blechs wanted to know was how soon a product could leave the labs. Making a guess, Mr. Nowinski said a year or two. That seemed promising, so in November 1980 the company was incorporated. ''It's fair to say,'' Mr. Nowinski comments, ''that this was started out by a group of determined novices.''

The Blechs put up about $200,000 of their own money, which represented much of their worth. The Search for Money

Hunting for more dollars, the group visited Schroders Inc., the financial services company. They found a receptive audience in John Connor, Schroders' chairman, who had once been president of Merck & Company, the giant drug concern.

''I was very much impressed by the modesty of the scientist,'' he recalled. ''All of them were aware of their limitations and thought they should hire in their bosses. They haven't tried to do everything themselves but have stuck to their own knitting.''

In February 1981, Schroders acted as the lead institution in a private placement that raised $1 million for Genetic Systems. Money kept rolling in. That May, the Syntex Corporation, a pharmaceutical company familiar with Mr. Nowinski, called and struck a $3.9 million, three-year research and marketing deal. Syva, a Syntex unit, would fund Genetic System's research into products to diagnose sexually transmitted diseases and then market the products to clinics. Genetic Systems would get a royalty on sales.

Syntex and its investment banker, Allen & Company, also chipped in $1.5 million for about a 12 percent stake in Genetic Systems. Several more deals were made with other drug makers. President Recruited

Meanwhile, a president was recruited - James Glavin, who had been vice president of sales and marketing for Oximetrix, a maker of medical devices.

Next, the Blechs met with D.H. Blair & Company in hopes of having them underwrite a public offering. Blair was at once receptive, and in June 1981 a public offering at $2 a share swiftly pulled in $6.6 million.

In January, the first product appeared, a diagnostic test for chlamydia, a sexually transmitted infection that afflicts an estimated 10 million people a year. The test can be read in two days, rather than the six required by earlier tests, and is easier to perform. Genetic Systems makes the antibodies for it and Syva assembles them into kits and sells them. Last week, a second product was introduced, a test for herpes. Longer-Range Plans

Down the road, Mr. Nowinski expects to move from diagnosing diseases to treating them. His team is also addressing respiratory and hospital-acquired infections, as well as researching the use of antibodies to type cells in connection with transfusions and organ transplantation. A long-term focus is cancer; a joint venture with Syntex is aimed at developing tests and treatments for cancer.

Revenues are just beginning to trickle in, though Genetic Systems has not yet made any money. Losses amounted to $401,000 and $1 million in its first two years. But Wall Street has heady hopes for the concern. A recent Paine Webber analysis predicted sales of perhaps $170 million by 1988.

In April, Merrill Lynch was the lead underwriter on an offering of 2.2 million shares that attracted an added $21.7 million of working capital. The company's stock, traded over-the-counter, is currently selling at about $15, putting the company's market value at a cool $270 million. Each of the Blechs owns close to one million shares. David concentrates on the company's strategic planning, while Isaac focuses on promotion.

The brothers, who work out of New York, have had such a grand time starting a company that they have since spawned three others - DNA Plant Technology, an agricultural genetics company; Laser Technics, which makes laser systems, and Nova Pharmaceutical, which is aimed at devising drugs to test compounds for their appropriate usage.

A GENETICS BREAKTHROUGH IS REPORTED

By Stuart Diamond

A biotechnology research company says it has produced the first commercial levels of human monoclonal antibodies for the treatment of disease.

Leading experts yesterday described the discovery by the Genetic Systems Company as very significant. Monoclonal antibodies are produced in a laboratory to seek out the substances that cannot be overcome by the body's own antibodies or on which vaccines cannot be used.

Fighting Disease

Until now, only small amounts of human antibodies could be produced in the laboratory. The antibodies, which specify disease organisms in the body for destruction, are products of the recent biotechnology revolution. They are thought to hold the key to an eventual cure of diseases such as cancer.

The commercial breakthrough was made by a team under the direction of Dr. Robert C. Nowinski, a respected microbiologist who is president of Genetic Systems and a pioneer in the development of human monoclonal antibodies. In a series of interviews, Dr. Nowinski said he had produced human monoclonal antibodies at concentrations of more than 100 micrograms per milliliter - 20 to 100 times greater than previous laboratory production. He said he had used a proprietary process for which the company received a patent last week.
Dr. Nowinski said the process enables the production of a range of human antibodies a thousand times broader than with previous processes. That means that researchers would have a much better chance of finding specific antibodies that cure diseases, he said.

"The significance here is that we now have a practical method to make human antibodies for therapy," he said. "It is no longer on a laboratory scale, but on a commercial scale."

The company, which is based in Seattle, was founded in 1980. It had a 1983 loss of $1.5 million on sales of $6 million. Nelson M. Schneider, who follows biotechnology at E. F. Hutton & Company, said Genetic Systems is regarded as a company that "combines good science with good commerce." He added that the company is in the developmental stage and well financed and that it has good prospects.

The company's stock, traded over- the-counter, was bid yesterday at $6.50, down from $17.75 at one point last year but up from $4.75 about a month ago.

Genetic Systems has helped develop very rapid tests using monoclonal antibodies to detect major venereal diseases and it is developing diagnostic tests for other ailments.

So far, Genetic Systems has isolated one antibody for commercial production. It is a serum to fight bacteria called pseudomonas, which cause infections that are the major killer of burn victims. The bacteria also infect people with chronic diseases such as cystic fibrosis and cancer. Dr. Nowinski said that small amounts of the antibody had cured pseudomonas infections in mice and that clinical trials were expected soon by the Cutter Group of Miles Laboratories, a subsidiary of Bayer A.G. of West Germany. Cutter collaborated on the research.

'If True, Impressive'

Dr. Jeffrey Schlom, chief of the tumor immunology laboratory at the National Cancer Institute and also a pioner in human monoclonal antibody research, yesterday called the innovation "very important." But he cautioned that he had not seen the research and that the discovery would have to pass clinical trials. Dr. Carlo M. Croce, a geneticist at the Wistar Institute in Philadelphia and another respected antibody researcher, said the innovation, "if it is true, would be very impressive." But he said it is hard to make a firm judgment without seeing the research results.

Antibodies find and attack substances foreign to the body, such as viruses and bacteria. Until now, research has concentrated on monoclonal antibodies produced from mice for use in disease diagnosis. It has been shown that mouse antibodies, which can be produced in large quantities, have limited use in the treatment of humans.

Bristol-Myers to buy Genetic Systems Corp.

NEW YORK (AP) — Bristol-Myers Co. has agreed to pay up to $294 million in stock to buy Genetic Systems Corp., a Seattle-based maker and developer of medical products.

Bristol-Myers, a major manufacturer of consumer health care and household products, agreed to buy Genetic Systems for $10.50 per share, payable in Bristol-Myers stock, officials of both companies announced Wednesday.

Genetic Systems uses biotechnological methods such as recombinant DNA technology in the creation, development, marketing and manufacture of medical products.

The five-year-old company has about 23.2 million common shares outstanding, with warrants and options for the issuance of another 4.8 million shares.

Stockholders would receive Bristol-Myers common stock based on its average closing price in the 10 trading days immediately before stockholders meet to vote on the acquisition, which also must be approved by the two companies' boards of directors.

Genetic Systems in May agreed in principle to sell 4.7 million shares of its stock at $8.50 a share to Syntex Corp., which already holds 500,000 of the company's shares.

The $39.9 million deal, in which Syntex also was to invest $20 million in research and development programs over five years, has not been voted on yet by Genetics Systems stockholders.

Officials for Syntex, a health care company based in Palo Alto, Calif., and Genetic Systems said they were unsure what effect the Bristol-Myers purchase would have on future relations between their companies.

But they said they did not believe the acquisition of Genetic Systems would affect Syntex's ownership of the Oncogen cancer research venture owned by the three firms.

Scientists modify smallpox vaccine to fight AIDS

Researchers plan to seek approval before end of year to begin testing new version of vaccine on humans

c.1986 N.Y. Times News Service

NEW YORK — Scientists have remodeled the most successful of all vaccines and plan to seek approval before the end of the year to test it on humans as a protection against AIDS.

The new vaccine was modified from the vaccinia virus, the only vaccine that has eradicated a human disease, smallpox.

Experts had estimated that the first successful AIDS vaccine would not be developed before the 1990s. If the next stages of the current research are successful, that timetable might be shortened considerably.

Before the drug is tested on humans, approval would have to be obtained from the Food and Drug Administration.

Two research teams successfully used genetic engineering techniques to remodel the vaccinia virus to carry a key gene of the AIDS virus. The gene directs the production of two proteins that act as a disguise, in effect fooling a cell into treating the vaccinia virus like an invading AIDS virus.

Vaccinia virus vaccine, by far the most widely used vaccine ever developed against human disease, has not been used for the general population since smallox was conquered almost a decade ago.

In the new experiments, mice infected with the remodeled vaccinia virus developed antibodies against the AIDS virus. One of the research teams also reported that the virus evokes antibody production in monkeys; their response is likely to be more relevant to the prospects in humans.

Neither research group has yet demonstrated that the antibodies protect against infection with AIDS virus. Studies on this point are in progress. Antibodies are best known for their ability to help the immune system protect against virus invasion, and conventional vaccines work by stimulating the body to produce antibodies against an invader.

AIDS is such an unusual disease, however, that protection by antibodies cannot be taken for granted without direct proof. AIDS patients themselves have antibodies against the virus, but evidently get no protection from them. In addition, the AIDS virus is unusually variable in its chemistry. Whether this would affect a vaccine is still unknown.

An advantage of using either the remodeled vaccinia virus or the purified AIDS virus protein is that neither would pose a risk of producing the disease AIDS in the recipient.

In the April 10 issue of Nature, scientists at the National Institutes of Health in Bethesda, Md., and a group from subsidiaries of the Bristol-Myers Co. in Seattle reported success in splicing a key gene of the AIDS virus into vaccinia virus.

The gene is the blueprint for two surface proteins of the AIDS virus: one is necessary to the process by which the virus attaches to and invades cells, the other has important structural functions. In the animal tests, cells innoculated with the modified vaccinia virus react as if they had been invaded by an AIDS virus and produce antibodies against it.

Although the two research groups worked independently of one another, they accomplished essentially the same feat. Both remodeled the vaccinia virus and demonstrated that it could be used to produce the AIDS virus proteins in their natural form and evoke antibody production in experimental animals.

"We consider it to be a critical step," said Dr. Robert Nowinski of the Bristol-Myers group.

He and his colleagues at the drug company's biotechnology subsidiaries in Seattle said they are planning to test the remodeled virus soon to see if it can protect chimpanzees against AIDS virus infection. Their group reported sucessful antibody production in seven of eight monkeys tested.

Nowinski and Dr. George Todaro of the Seattle group said that by the end of this year, they expect to ask the Food and Drug Administration for permission to start safety testing of their experimental vaccine in human volunteers.

Authors of the report from the national institutes are Dr. Sekhar Chakrabarti and Dr. Bernard Moss of the National Institute of Allergy and Infectious Diseases and Dr. Marjorie Robert-Guroff, Dr. Flossie Wong-Staal and Dr. Robert C. Gallo of the National Cancer Institute. The institutes are major units of the National Institutes of Health.

Dr. Shiuu-Lok Hu and Steve G. Kosowski of Oncogen, a Bristol-Myers subsidiary in Seattle and Dr. Joel M. Dalrymple of the Army Medical Research Institute of Infectious Diseases, Frederick, Md., are the authors of the other report.

Human testing of AIDS vaccines draws nearer

By Lisa Krieger
EXAMINER MEDICAL WRITER

WASHINGTON — The federal government is gearing up to test AIDS vaccines in people, officials say.

Three teams of scientists have asked the government for permission to begin limited human testing of possible AIDS vaccines, Food and Drug Administration spokesman Brad Stone said Thursday.

In addition, Dr. Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, said he knew of five or six other teams ready to seek FDA testing approval.

Although prevention of the disease is probably years off, promising studies in animals have paved the way for human trials, Dr. John R. La Montagne of the National Institutes of Health said Wednesday at an NIH-sponsored symposium on AIDS vaccine.

At Wednesday's session, scientists from Genetic Systems Corp. of Seattle, a subsidiary of Bristol Myers, reported that vaccinated chimpanzees were able to reduce the levels of the AIDS virus in their blood.

Although these vaccines did not prevent infection, it reduced by 10 to 100 times the circulating levels of the AIDS virus in the animals' blood.

More important, it also caused the animals to produce antibodies that fight off infectious agents such as AIDS, said Robert C. Nowinski of Genetic Systems.

"It is still very speculative, but we're excited," Nowinski said. "For the first time, we see a distinct biological effect."

The company's vaccine involves a protein from the outer coat of the AIDS virus that is delivered to the body by the vaccinia virus, the harmless virus also used in the smallpox vaccine.

A similar product, recently injected by French scientist Dr. Daniel Zagury into himself and two African researchers, also has been found to stimulate production of antibodies to the AIDS virus.

Scientists at Genentech of South San Francisco are trying another approach. Using recombinant DNA technology, they are attempting to develop a vaccine based on a portion of the AIDS virus envelope. They, too, hope to begin human testing this year.

Dr. Allan Goldstein, chairman of biochemistry at George Washington University in Washington, D.C., and his colleagues are trying to develop a vaccine based on a bit of protein from the inner core of the AIDS virus. Their vaccine is one of the three under review at the FDA. The agency is not permitted to identify the other applicants.

Dr. Robert Gallo, a top AIDS researcher and head of the National Cancer Institute's tumor cell biology laboratory, said it may be possible to combine a half-dozen compounds, each acting against several different virus variations, into one vaccine. It may also be possible to induce the body's immune system to battle many different virus variations when stimulated by one compound.

At Wednesday's meeting, federal officials described the procedures to be followed in human testing of AIDS vaccines.

The first step, said La Montagne, is to test for vaccine safety. The government will seek a handful of people who are at low risk of AIDS. Some will be given the vaccine; others will be given an inactive placebo.

The first human subjects will be isolated for 14 days to ensure that the organism contained in the vaccine — a smallpoxlike virus — protects them but does not affect others, said La Montague.

Later, much larger studies will test to see if the vaccines are effective in preventing AIDS.

Examiner wire services contributed to this report.

BUSINESS

Blood test gives small biotech firm early success

Boston Biomedica's product fills need to safeguard purity of blood supplies

By John H. Stevens
SPECIAL TO THE GLOBE

WEST BRIDGEWATER – It is hard to imagine tiny Boston Biomedica as a catalyst for the state's next economic expansion.

But if biotechnology becomes a savior to the state's economy, as biotech boosters would have us believe, then Boston Biomedica is one company that is already playing a role.

The 21-employee firm started in a renovated storeroom in 1986, had dollar sales in seven figures last year and a growth rate that could place it well into Inc. magazine's list of the 500 fastest-growing companies in the nation next year, said Richard T. Schumacher, Boston Biomedica's president.

The company, now located in a two-story industrial park building, has been praised by scientists and health agency officials, including a mention at a Swedish symposium a few years ago. One of its new products helped prove the effectiveness of the first blood test for the HIV II AIDS virus to gain tentative approval for public use, from the US Food and Drug Administration this spring, a test developed by Genetic Systems Corp., a Bristol-Myers Squibb subsidiary.

"We expected to receive accolades for our products, but not so openly at scientific meetings," Schumacher said in a recent interview.

"It has given this company a level of credibility I didn't expect to have at this point."

But credibility, essential to success in the biotech field, is something Schumacher set out to gain when he started the privately held company with money from family and friends. Schumacher understood the necessity of not only creating a useful product, but of co-authoring scientific papers with high-profile scientists and agencies in peer-review journals to gain recognition, and sales, for his firm.

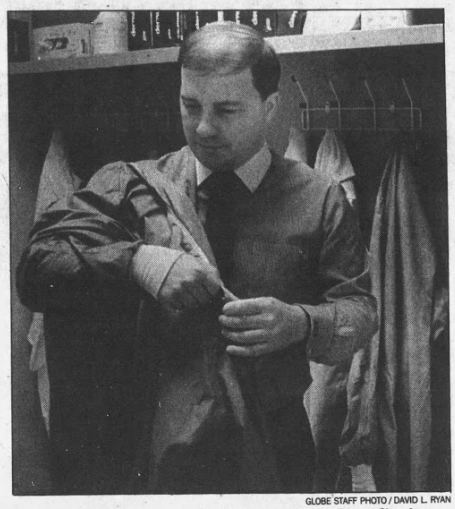
"I knew Rick was highly regarded in academic circles," said Wellesley lawyer Henry Malkasian Sr., in explaining his early investment in Boston Biomedica. "He had the ability, the brains and the acc otability. Since then, he's gained a lot of recognition in professional circles."

The company's efforts have helped guarantee a safer blood supply in Europe and the United States and spawned a rarity in the biotech field: a balance sheet in the black after the first two years.

Building sales

"A lot of companies in this field raise a lot of capital up front, putting a lot of money into research to develop products that take a lot of time to get into the market," Schumacher said. "I decided to use my expertise to immediately develop tangible products. I set up the company to have measurable sales growth without a lot of noise" about research and development.

Boston Biomedica is not a biotech company in the purest sense, Schumacher said; it does no molecular biology, no gene splicing and no viral culture work. Its product is a small plastic box containing a dozen or so plastic vials. In each vial is a solution containing a known quantity of some material found in the blood, such as serum cholesterol, or antibodies the body would produce when exposed to viruses such as the AIDS virus HIV I or HIV II or any of the hepatitis viruses.



GLOBE STAFF PHOTO / DAVID L. RYAN

Richard T. Schumacher, president, started Boston Biomedica in a renovated storeroom in 1986 with money from family and friends.

These ready-to-use packages are used by researchers to gauge the accuracy and quality of new blood tests they are developing. The blood tests, in turn, are used by hospitals to find out if a patient has been exposed to a certain virus, or to measure other things found in blood, such as serum cholesterol. Blood tests are also used by blood banks to screen donated blood for exposure to the AIDS and hepatitis viruses.

Setting the standard

Boston Biomedica, Schumacher likes to say, acts as a referee in the biotech playing field, ensuring that blood tests perform to their intended levels of accuracy. Its products are the standard by which such tests are measured, and the firm has only a few competitors.

One of the competitors, Serologicals Inc., also gave good marks to Schumacher and his firm.

"They've enjoyed a good reputation and have always stayed out front in looking for new technologies," said Timm Hurst, executive vice president of Serologicals, which is based in Pensacola, Fla. "Rick's well known and he's done a good job. He's a good marketer."

Schumacher has found a ready market for his products, especially in the area of infectious diseases with the advent of AIDS and the recent discovery of the hepatitis C virus.

Genetic Systems Corp. used Boston Biomedica's tests to measure the accuracy of its new HIV II blood test. HIV II is a strain of AIDS virus found mostly in West Africa, with only a dozen or so cases found in the United States so far, Schumacher said. Federal health officials hope to begin screening the nation's blood supply for HIV II before it becomes a problem, he said.

Began at lab

Schumacher, trained as a zoologist at the University of New Hampshire, got the entrepreneurial bug while running a lab at the Center for Blood Research in Boston, which is affiliated with the Harvard Medical School. Schumacher worked at the lab from 1972 until 1985 and was general manager of its for-profit arm for five years.

He incorporated Boston Biomedica in 1978 as a commercial venture separate from his research work and the lab's commercial work. Working after hours and on weekends, Schumacher used the lab to conduct hepatitis tests for dozens of hospitals. By 1985, he was ready to use his experience and his contacts to build his own business. He settled in West Bridgewater because space was cheaper.

"As a user of blood-test kits made by other companies, I saw a need to develop quality control products in areas where there were none," Schumacher said.

The next step for Boston Biomedica is selling its kits to the people who use blood tests – hospitals and blood banks – so that they can check the accuracy of the tests themselves as extra insurance, Schumacher said. Schumacher has met his business goals so far, and he expects Boston Biomedica to continue growing at a 50 percent clip per year.

"We should be around for a long time generating jobs for the local economy," he said.

1990 (April 20) - Seattle Times : "Seattle Biotechnology Company Sold"

https://archive.seattletimes.com/archive/?date=19900420&slug=1067396

1990-04-20-seattle-times-biotechnology-company-sold.pdf

Apr 20, 1990 , Polly Lane

Genetic Systems Corp., a Seattle biotechnology company best known for its research on testing for the Acquired Immune Deficiency Syndrome (AIDS), is being sold by Bristol-Meyers Squibb Co. to a unit of Sanofi of France.

Sanofi is 25-year-old conglomerate that specializes in pharmaceuticals and diagnostics, ingredients for the food industry, agricultural and animal health products, and perfume and beauty products. Its stock is half owned by the Societe Nationale Elf Aquitaine Group and half publicly traded.

The purchase of Genetics System brings to 17 the number of Sanofi's affiliates in diagnostics. Terms of the cash sale were not disclosed.

Genetic Systems was founded here in 1980 and sold to Bristol-Meyers in 1986. Its relationship with Sanofi goes back to 1984, when the two companies formed a joint venture, Blood Virus Diagnostics, to help develop specialized tests for viruses.

The Seattle company is not yet profitable, although Sanofi executives said it has annual sales of about $10 million now and may increase that to about $18 million next year. Sanofi estimated that its diagnostics division, of which Genetic Systems will be a part, will have $175 million in sales this year.

Terrance Bieker, president of Kallestad Diagnostics in Chaska, Minn., Sanofi's American affiliate, is a former Genetic Systems manager who left Seattle in 1988. ``We intend to manage Genetic Systems as it is now,'' he said.

Mark Fieczkarek, who has been vice president of operations and finance at Genetic Systems, has been named general manager here. Tim Ellis, who has been general manager, will remain with Bristol-Meyers Squibb, Bieker said.

Genetic Systems, which has about 150 employees, is hiring now because it is anticipating approval soon from the Food and Drug Administration to market a new AIDS virus test.

Bieker said he expects some additional manufacturing work also will be assigned here through the parent company. Whether that means additional hiring is not yet known, he said.

His company specializes in different health tests.

``There is no overlap or duplication of products with Genetic Systems. It's a good fit,'' he said.

AIDS testing produced flood of false results

A report prepared for a U.S. House of Representatives subcommittee charges that the true history of the invention of the AIDS test for years has remained obscured behind a veil of official misstatements by senior U.S. government officials. The report has not yet been made public.

This is the second article in a three-part series.

JOHN CREWDSON
CHICAGO TRIBUNE

WASHINGTON — Ronald Reagan's administration had promised the American people an AIDS test by November 1984, a month that also happened to mark Reagan's re-election to a second term. But as the election came and went, the five companies chosen by the Public Health Service to manufacture the test were still evaluating their prototypes on blood samples gathered from around the country.

What they, and an increasingly concerned administration, were discovering was that the AIDS tests embodied a fundamental flaw: most of the blood samples that were testing positive for antibodies to the AIDS virus weren't positive at all.

The ink had scarcely dried on the government's application for a patent on the AIDS test before a notice appeared in the Federal Register inviting interested companies to apply for a license to make and sell the urgently needed test. In view of "the important public-health considerations involved," applicants were given 10 days to respond.

With the government predicting that 23 million AIDS tests would be needed each year, there was no shortage of applicants. They ranged from pharmaceutical giants like Abbott Laboratories or Johnson and Johnson to smaller firms with exotic names like Chiron, Cetus and Hybritech.

Abbott, a $5 billion-a-year company and already the predominant supplier of blood-testing equipment in the United States, was an obvious choice.

Also selected were Baxter-Travenol, another major health-care supplier, and three lesser-known firms with ties to the laboratory of Dr. Robert Gallo, the National Institutes of Health researcher who had developed the American AIDS test.

The losers in the competition included a fledgling Seattle company called Genetic Systems Corp., founded just three years before by a young University of Washington microbiologist named Robert Nowinski.

In mid-June 1984, Abbott and the four other licensed companies were invited to pick up the initial samples of the AIDS virus isolated in Gallo's lab that would be used to make their AIDS testing kits. They were also given a special culture of white blood cells, which Gallo had

AIDS *Different culturing method key to French test's superiority*

CONTINUED FROM PAGE A1

named "H9," in which the virus could be grown in commercial quantities.

Unlike most cells, those in H9 weren't killed by the replicating virus. So important was the production system to the making of the test that when the government filed for a patent on the Gallo AIDS test, it applied for a separate patent on Gallo's H9.

The biggest single customer in the world for the AIDS test — and also the most important, because of the influence its decision has on other potential customers — was the American Red Cross, which collects and processes more than half the 11 million pints of blood Americans donate each year.

Protect the supply

The Red Cross also was comparing the prospective AIDS tests, and like the government it was finding that as many as four out of five initially positive results were likely to be false. But Dr. S. Gerald Sandler, then the Red Cross's chief of medical operations, said his organization would still put the test into service the minute it was approved.

"Even though the test is not perfect," Sandler was quoted as saying, "it makes it possible to protect the blood supply."

In March 1985, the Food and Drug Administration granted the first AIDS-test license to Abbott, which promptly became the exclusive supplier of the AIDS test to the Red Cross, which in turn was now the world's biggest single purchaser of the test. Over the next four months, according to figures it later submitted to the government, Abbott would sell more than $8 million worth of AIDS tests.

As the Abbott test swung into production, however, it became clear that the problem of false-positive reactions had not been solved. Because a positive AIDS test was more likely than not to be false, every positive test had to be repeated. If the second test was also positive, it was followed by a different kind of confirmatory test, at a total cost of about $40.

As the Public Health Service was selecting the companies that would produce the Gallo test, work was also beginning on a commercial AIDS test at the Pasteur Institute of Paris, where the AIDS virus had been discovered the previous year.

Although the Pasteur Institute is a private foundation, it is associated with a commercial company, called Pasteur Diagnostics, which sells various products derived from the foundation's research.

Pasteur Diagnostics had the right to make and market the French AIDS test in France, but it had no production facility in North America. Not long after Genetic Systems' application to make the Gallo AIDS test had been rejected by the government, Nowinski had obtained the U.S. license for the test invented at Pasteur.

Although there were several differences between the Gallo AIDS test and the one Genetic Systems produced with the Pasteur's methods and materials, one was more important than the others. Genetic Systems, which had no license to use Gallo's H9 virus culturing system, grew the AIDS virus from France in a different blood-cell culture, called CEM-13, that had been developed for that purpose at Pasteur.

Gallo's H9, once infected, produced endless quantities of the AIDS virus, while the CEM-13 cells are ultimately killed by the virus. But the French had found a way of growing the virus in industrial quantities by infecting successive batches of CEM-13. "You grow as much virus by (the Pasteur's) method as in any other method," Nowinski said.

French angered

As several studies later showed, it was the difference between the two culturing methods that accounted for the superior specificity of the Pasteur test. Apparently, the blood of some individuals not infected with the AIDS virus contained antibodies to proteins on the surface of Gallo's H9 blood cells; it was these H9 antibodies that were responsible for the false positives in the Gallo test.

The superior accuracy of the Pasteur test should have been a major selling point. But the French, angry at not having received the American patent on the AIDS test, were threatening to take the U.S. Department of Health to court, and when Genetic Systems began looking for customers, it encountered problems.

One important buyer was the U.S. Department of Defence, which was soon to begin a massive effort to test all military personnel for AIDS. But a Genetic Systems representative who made a sales presentation at the Pentagon recalled being told the U.S. military did not intend to do business with the French.

Genetic Systems had better luck with the Red Cross. When the Red Cross began testing blood for AIDS in March 1985, the Abbott test had been the only one approved by the FDA. But in February 1986, two days after the Genetic Systems test was approved by the FDA, a Red Cross task force completed its evaluation of the AIDS blood tests then on the market.

According to the task-force report, the French test produced fewer false positives than any other test. Even when compared with Abbott, the Pasteur test was the Red Cross's "test of choice."

Genetic Systems, the task force said, should be given "the largest market share" of the Red Cross AIDS-test business, at least 80 per cent of the agency's total annual purchases.

But when Red Cross officials offered contracts, the 80-per-cent share went instead to Abbott.

A few days after the Red Cross contract took effect, scientists at the National Institutes of Health reported that, in addition to producing false-positive results, the Abbott test was also producing the far more drastic false negatives.

Since the summer of 1985, when a Colorado man caught the AIDS virus from blood that had tested negative, it had been known that some samples of AIDS-contaminated blood were getting through the "blood screen."

The explanation had been that the donors of the contaminated blood had been so recently infected with the AIDS virus that they had not yet developed antibodies to it. No AIDS test, it was thought, could pick up a recently infected person during the early incubation period.

In the spring of 1986, an NIH researcher named Alfred Saah discovered that while the Abbott test couldn't pick up antibodies in recently infected individuals, the Genetic Systems test could.

Anti-trust suit

On May 14, 1986, Saah presented his alarming findings to the Public Health Service's blood working group, and again in early July to an NIH conference where they were reported in the press.

In 1987 Genetic Systems, which by then had been purchased by Bristol-Myers, brought an anti-trust suit against Abbott and the Red Cross. Although the suit was ultimately dismissed, documents filed in the case showed that after the problem with false negatives arose the Red Cross asked Genetic Systems how quickly it could supply all of the agency's AIDS test needs.

The company replied that it could do so within one month, but the contract was never forthcoming. Instead, according to Sandler, Abbott was given "a matter of weeks" to make the promised improvements.

Letting bad blood in

On Jan. 16, 1987, more than eight months after Saah had presented his data to the Public Health Service, the reconfigured Abbott test was approved by the FDA. The first units were shipped by the company on Jan. 26.

In its lawsuit, Genetic Systems maintained that "the inferior sensitivity of the Abbott AIDS test meant, quite simply, that the Abbott AIDS test was allowing contaminated blood to pass into the blood supply."

Red Cross attorney Karen Lipton acknowledged that the Red Cross was currently being sued by several individuals who claimed they had been transfused with AIDS-infected blood after the Red Cross began testing in the spring of 1985. Lipton said she did not know whether any of those individuals had received the AIDS-contaminated blood during the last half of 1986 or the first part of 1987.

1997 (Mar 09) - BizJournals.com : "Long-life ambitions"

Two local biotech firms search for ways to slow down the aging process

By Rami Grunbaum – Mar 9, 1997 Updated Mar 9, 1997, 9:00pm PST - Source : [HW0062][GDrive]

Two Seattle biotechnology companies, both quite young, are working to unlock the genetic secrets of growing old.

Lifespan Bioscience Inc. and Aeiveos Sciences Group each have raised several million dollars with the ultimate goal of giving people additional years of disease-free living.

But that's where the similarities between the two end: Lifespan and Aeiveos seem opposites in corporate spirit and in scientific direction.

At Lifespan, the top executives have previous biotechnology experience and stress a practical, short-term agenda of partnering with bigger drug companies to bring in revenue.

"What we're good at is gene discovery; what they're good at is drug discovery and development," said L**ifespan president and CEO Joseph Brown.**

The more enigmatic Aeiveos is led by former software executive Robert Bradbury, who argues that the human genome is no more complex than Microsoft's Windows NT operating system.

"Within the next 20 years, the limit on maximum human lifespan will be eliminated," he optimistically proclaims on the company's elaborate Web site.

Its business strategy seems less well-developed, or perhaps more long-term. Vice president Tyrone Mowatt said Aeiveos -- a name coined from the Greek words for "forever" and "young" -- currently is focused on research, not revenue.

"We're still looking at expanding our basic research, understanding more about aging, and from there understanding the potential therapeutics for this market," he said.

The two have disparate scientific approaches, as well.

One of Lifespan's chief assets is a library of 100,000 samples of diseased human tissue -- a reference library "of basically all the aging diseases man can get," said chief scientific officer Glenna Burmer.

Lifespan's researchers will use these to explore which genes contribute to aging-related afflictions, ranging from Alzheimer's to osteoporosis and cancer.

At Aeiveos, on the other hand, "We are not looking at any pathologies, we are looking at `normal' aging," said chief scientist Rajinder Kaul.

Aeiveos aims to study the genetic codes of centenarians -- people who live to the ripe age of 100 -- to learn how they ward off the diseases that strike down most people much earlier.

Many other companies are also in the hunt. Locally, Darwin Molecular Corp. last year identified two genes implicated in aging diseases, one for early-onset Alzheimer's disease and another for Werner's syndrome. Darwin merged with Chiroscience Group plc of England late last year, giving it access to drug-development expertise.

The Human Genome Project -- a national effort to decipher all 100,000 genes in human DNA -- is the springboard for much of the work these genomics companies hope to do.

The resulting database has been likened to the white pages of a city telephone directory -- a lot of data, but little help if you don't know who you're looking for.

Extending the phone-book analogy, Lifespan's Brown said that when drug companies search for the genetic perpetrator of a disease, Lifespan will tell them more than "the culprit's in here. ... What we'd like to do is give them the name, address and occupation of everyone seen at the scene of the crime."

That's crucial, because there may be hundreds or thousands of genes that are turned on or off by a disease, but discovering a treatment hinges on determining which ones are actually responsible for the problem.

Lifespan has invented or licensed screening techniques that can reduce the list of suspects down to "a handful," said Brown.

Of the entire genome, "it's the top 1 percent -- there's probably 1,000 -- that will prove excellent targets" for drugs, Brown said. "Remarkably, to date, only about 50 genes are targeted by pharmaceuticals."

Lifespan, which now employs 15, can grow to 50 or 60 people in the 12,000 square feet it recently leased in the Denny Regrade area, company officials said.

Unlike some rival companies studying the genetics of aging, Lifespan won't be studying the simpler creatures -- flatworms, mice, fruit flies or yeast -- favored by many genetics researchers. "We believe very firmly in working with humans" -- meaning human cells, said Brown.

Although the initial strategy calls for Lifespan to do research under contract for big drug companies, Brown said "we insist on retaining some intellectual property" from each deal -- perhaps the rights to apply the results to diseases the partner isn't pursuing. Simultaneously, Lifespan will pursue its own longer-term research on basic mechanisms of cell aging, he said.

Brown, previously at Bristol-Myers Squibb in Seattle, in 1992 became PathoGenesis Corp.'s first employee after founder [Dr. Robert Charles Nowinski (born 1945)]. Burmer was the first program director at PathoGenesis, and managed its pathogen discovery program.

ABOUT GENUITY

"Genuity is a subsidiary of Bechtel Enterprises, the development, financing and ownership affiliate of the Bechtel organization. Genuity is a value-added provider of distributed application hosting, access and security technologies that provide cost-effective, scaleable and highly reliable Internet infrastructure for commercial applications. With headquarters in San Francisco, Genuity also has data centers established in Chicago, Los Angeles, New York, Phoenix, San Jose, Washington, D.C. and London. Genuity is the creator of Hopscotch, a service allowing organizations to ensure the accessibility and performance of their mission-critical Internet sites by eliminating DNS look-up failures and solving Internet latency problems. " Source : [HC004M] [GDrive]

HISTORY

"In the early 1990's, following the NSF disgorgement of commercial Internet traffic from the NSFNet, [**Rodney Lance Joffe (born 1954)**] launched [**Internet Media Network Incorporated**] as the Internet division of [American Computing Group]. " Source - [HC004O][GDrive]

" In 1996 in partnership with **Bechtel Enterprises**, [**Internet Media Network Incorporated**] was renamed [**Genuity Incorporated**], which then went on to became one of the largest ISP Data Center Operators in the world. The company was driven by Hopscotch™, invented and patented by [**Rodney Lance Joffe (born 1954)**], and the very first formal content distribution and load balancing technology. FINANCE

Financial Manager

Internet Media Network (IMN) is a Bechtel Company which sells Internet Access and other related services.

We are currently seeking an individual for our Phoenix office to oversee selected financial transactions, operations and financial reporting. Responsibilities include managing cash accounting activities, implementing commission programs with Sales/Marketing management, overseeing general accounting activities, and interfacing with outside financial institutions and internal organizations.

Candidates should have a degree in Accounting or other finance related area and experience with billings within a high-volume transaction environment. Preferred applicants will have an innovative approach to using systems for implementing solutions to business requirements and using the Internet as an operational tool. Proficiency with Excel and Excel Pivot Tables as well as excellent communication and management skills required.

For immediate consideration, please send resume to:

Internet Media Network

COMPUTER

Systems Supervisor

Genuity, a new Bechtel start-up company located in Phoenix, is seeking a Systems Supervisor to oversee development and implementation for various systems.

Individual will supervise staff of programmers; develop business specifications; and install and customize systems to support internal operations. Ability to translate business requirements to systems implementation designs a must. Windows NT and SQL Server expertise required; Internet experience a plus.

For immediate consideration, please send resume to:

Genuity
Employment Dept. LBL 72-P-2

1996 (Nov 01) - SFGate: Bechtel Jumps on the Net / New unit offers industrial-strength communication

Bechtel unit?

Jonathan Marshall, Chronicle Economics Editor / Nov. 1, 1996Updated: Feb. 2, 2012 11:51 a.m. / Source - [HM001C][GDrive]

Summary *- "San Francisco engineering giant Bechtel Corp., best known for moving mountains and building tunnels, has jumped on the Internet bandwagon. A recently formed Bechtel company, Genuity, is now offering industrial- strength Internet services to companies, government agencies and educational institutions. It plans to capitalize on many companies' frustration with slow and unreliable access to the network."*

Late last year [, which would be 1995 - as this article is 1996], Bechtel quietly purchased Phoenix-based [Internet Media Network Incorporated], a dormant Internet access provider. The company, which it renamed Genuity, was one of 22 so-called "Tier 1" companies that make up the Internet's backbone.

Others in the same exclusive club include AT&T, MCI, UUNet, AOL and CompuServe.

Unlike many other providers, however, Genuity doesn't plan to serve individuals with dial-up connections.

Instead, it aims to "supply an industrial-strength information infrastructure so that businesses and other institutions can tap the economic power and potential of the Internet," said John Carter, president of Bechtel Enterprises.

With more than 30 clients, Genuity has grown from scratch to more than 100 employees in 10 months. Nearly all were recruited outside Bechtel.

Genuity, along with several local multimedia companies, will play a behind-the-scenes role at an online chat session this Monday with San Francisco's ubiquitous Mayor Willie Brown.

The company will provide the computer and network services to let thousands of Internet users chat with the mayor from 5 p.m. to 6 p.m. The discussion will embrace such issues as the future of technology industries in San Francisco and how to use the Internet to make San Francisco a better place to live and work. The Web site for the discussion is www.damayor.org.

Genuity is also building an "intranet," or internal corporate computer network, for CNET, an Internet news service.

It will link CNET's offices in San Francisco, Phoenix, Watchung, N.J., and other planned locations.

"There's no limit to how big this thing can get," said Pete Lega, CNET's vice president of technical architecture. "I can get a new office anywhere in the United States to join our network within two or three weeks, and we don't have to worry about it. It's reliable, private and secure."

At its Phoenix center, Genuity manages some of CNET's Internet servers -- computers that store and transmit information on the network -- to lighten the load on CNET's main servers in San Francisco.

Genuity leases two giant data lines from MCI and Sprint. From these lines, it provides Internet service mainly to San Francisco, Los Angeles, Phoenix, Washington, D.C., New York and Chicago. It will operate, maintain and back up computers and networks providing Web service, e-mail and other Internet services, in effect providing one-stop-shopping for network operation.

By carefully managing who gets on its network, Genuity plans to avoid overloading its capacity and jeopardizing its reliability. Technical support staff in Phoenix constantly monitor the network to prevent failures. They even watch 24-hour news and weather channels to spot problems that could crop up elsewhere on the Internet, and route data traffic in safe directions.

In another high-tech venture, Bechtel announced last month its plan to form an international joint venture with CellNet Data Systems, Inc. of San Carlos. Bechtel will handle overseas marketing of CellNet's wireless meter-reading systems, used by electric, gas and water utilities.

Bechtel is no stranger to high technology, despite its reputation for moving dirt. It works with state-of-the-art computer-aided design systems and has the largest research and development arm in the engineering and construction business, company officials say.

Bechtel also excels in complex project management, from the new Hong Kong airport to the English Channel tunnel. It has helped major telecommunications companies such as Sprint and MCI set up national land-line and wireless communications networks.

Its new technology ventures are thus a natural progression rather than a radical change, said Robert Dove, vice president of corporate investments for Bechtel Enterprises.

"We see the Internet as one more step in the management of complex projects," he said. "To have a window on this technology is very important as we move into the next century."

Dove indicated that Genuity, like many Internet companies, isn't making money yet. "But we are very pleased with the way the investment is going. The potential is tremendous."

1996 (Dec) - Patent Application for "Hopscotch"

Distributed computing system and method for distributing user requests to replicated network servers

Abstract

Routing requests for data objects from clients includes receiving a request for a data object from a client, providing content servers capable of serving data objects, determining a server from the content servers, and informing the client of an address associated with the determined server accessible by the selected route. Determining a server includes, for each content server, identifying routes between the content server and the client, determining traversal times for the routes, and selecting a route from among the routes based on the traversal times

New player joins elite providers of Internet hubs

Bechtel subsidiary opening access point

By Therese Poletti
REUTERS

NEW YORK — A subsidiary of construction and engineering giant Bechtel Corp. said it will unveil a new Internet gateway as it seeks to break what it says is an oligopoly consisting of the phone companies that manage most of the world's Net hubs.

Genuity Inc. said the gateway, known as a network access point, and a new service dubbed Hopscotch would relieve the traffic jams now bedeviling the Internet, resulting in faster, more reliable Internet service for consumers and corporations.

The network access point, which will be based in Phoenix, and Hopscotch were scheduled to be formally announced Tuesday at the Internet World trade show in New York, San Francisco-based Genuity said.

There are now about eight major network access points, which funnel and route most of the world's Internet traffic. Network access points also allow smaller Internet access providers to gain access to the Net and have recently suffered heavy congestion.

6 access points in U.S.

Six major network access points are in the United States: San Jose; Washington, D.C.; Chicago; Los Angeles; Palo Alto and the New York area.

Until mid-1995, the National Science Foundation funded four of the biggest U.S. access points. But, with the NSF no longer funding the Internet, these gateways are operated by Baby Bell regional phone companies or long-distance phone companies.

"That's why we believe (Tuesday) will be a new day for the Internet," Rodney Joffe, chief technology officer of Genuity, said in an interview.

Joffe said that both the Baby Bells and the long-distance providers make money by charging the big Internet service providers $2,500 to $5,000 monthly for access to the Net.

However, he said, the phone companies were not making the investments needed to support the growth of the Internet.

Genuity said it will make its new network access point a not-for-profit operation in the hopes that it will gain many customers for its network hosting services. Genuity said it was not charging Internet service providers rent or connection fees at its Phoenix center.

More facilities possible

Genuity said it hoped to build more facilities like the one in Phoenix.

Pacific Telesis Group, which manages a network access point, recently said its local telephone service was suffering because of massive Internet usage in California, which was experiencing heavy congestion at its network access point.

Genuity hopes to sell its network services, including its Hopscotch service — a Web site hosting service with advanced features — to businesses. Hopscotch is aimed at companies selling over the Internet, news services and major corporate Internet sites. Already, Genuity said, it has 35 customers, including C/Net Inc., the Internet-based news service in San Francisco that focuses on technology.

Genuity said its Hopscotch service was available immediately, starting at $5,000 per month, for customers who want to design and start up large-scale Web sites.

Local network to ease burden on the Internet

By Kerry Fehr-Snyder
Staff writer

Imagine living in Phoenix but having to drive through San Francisco each time you wanted to go to the east Valley.

You've just imagined the Internet.

The computer "network of networks" is great for sending e-mail to a friend in Norway or downloading files about the Mars Pathfinder mission from NASA's home page.

But when it comes using it closer to home, the Internet is a model of inefficiency.

The result is that Internet traffic is at record levels, increasing wait times for users and threatening to collapse the public telephone network.

But one solution to the bottleneck is in the offing.

A subsidiary of Bechtel Corp. has created a not-for-profit network access point in Phoenix that will

— See LOCAL, page E2

investments.

Local network will ease burden on the Internet

— LOCAL from page E1

route Internet requests within the state without first traveling to out-of-state switching posts in San Francisco, Chicago or Washington, D.C., first.

Genuity, which provides high-speed Internet access, announced the opening of its Metropolitan Phoenix Internet Exchange on Tuesday during the Internet World trade show in New York City.

The network access point is based at Genuity's facility near Central Avenue and Indian School Road. It marks the first not-for-profit network access point in the country and will serve as a test site for others.

"Very clearly, Genuity is not doing this because we're a good company or good guys," said Rodney Joffe, Genuity's chief technology officer. "We're a major Internet service provider, and this makes good business sense."

By routing local traffic locally, Genuity will speed Internet transactions for users in Arizona. It will also reduce the amount of traffic that must travel through the four network access points established in the early days of the Internet, thereby reducing wear and tear on the Internet backbone and the public telephone network.

"Within milliseconds, rather than seconds, the data is back to you," Joffe said. "It helps the Internet in general because it takes the load off of the other NAPs."

The idea for a local network access point came from Arizona State University, which received complaints from Internet service providers looking for faster ways to connect to the Internet, said Daryl Eschbach, ASU's executive director of telecommunications services.

After some brainstorming, the group hit upon the idea of creating a local exchange point, and Genuity, one of three Internet service providers for ASU, agreed to establish the facility and pay for its costs.

Despite its global appeal, the Internet is primarily used to send e-mail and retrieve files in the same city or state in which users are. Internet watchers estimate that 60 percent to 80 percent of all locally generated Internet traffic is for information that resides on computers in the same state, Eschbach said.

And with the number of Internet users growing 7.5 percent a week, according to Vint Cerf, an MCI executive and the father of the Internet, finding ways to relieve congestion is becoming critical.

"If the top 100 metro areas did what is being done in Phoenix, you'd see some impact in relieving congestion," Eschbach said.

Although the Phoenix network access point will benefit Genuity's customers, primarily businesses, it is expected to help consumers who subscribe to local Internet service providers.

Goodnet, Getnet, Primenet and other service providers in the Valley are expected to use the network access point to speed up Internet transactions and reduce out-of-state Internet traffic.

"Over the course of the next month or two, the city and the users are going to discover the Internet is a much more efficient place for them. There will be a noticeable difference to the users," Joffe said.

Genuity's move was praised by Internet experts who warn that the global network is in danger of collapsing under its own weight.

Infoworld columnist Bob Metcalfe, who was the first to warn of an Internet collapse, said the Phoenix network access point will increase network capacity, alleviate traffic and achieve the best use of the Internet infrastructure.

Hal Varian, dean of the school of information management and systems at the University of California-Berkeley, said he expects other local network access points to be established.

"I think establishing the NAP in Phoenix is quite sensible," he said. "I think we'll see more of this happen. It's the first public connection since the privatization of the Internet."

[HN01ET][GDrive]

1996 (Dec 15) - Tasty Bits from the Technology Front - A new Net access point

https://tbtf.com/archive/1996-12-14.html

When the National Science Foundation stopped funding the Internet backbone in the spring of 1995 it turned over operation of four U.S. Network Access Points to private companies -- in fact, to the "baby Bell" regional phone companies created at the breakup of the Bell system. Most of the world's Internet traffic passes through these (and a few other) NAPs. The phone companies charge local and regional ISPs thousands of dollars a month for access to the Internet through these NAPs. Now a player from outside the telphone fraternity is breaking into this cozy business -- and is charging no connection fees to ISPs. Genuity [20] is an ISP for large-scale customers and a subsidiary of Bechtel, the international construction and engineering company. The ISP has opened a new NAP [21] in Phoenix, which it intends to run on a not-for-profit basis in order to build its network services business. For a quick overview of the existing U.S. NAPs see the Genuity topology map [22].

At Internet World in New York Genuity also announced the Hopscotch service [23], which it calls an "industrial-strength solution to Net traffic." It involves real-time tracking of Net congestion and optimal routing of the ISP's customers' data.

Internet service provider ensures response times

By John Cox
San Francisco

A pathbreaking Web service provider later this month will open in Los Angeles the last of seven data centers designed to create a high-performance Web backbone with guaranteed response times.

Genuity, Inc., based here, is a Bechtel Corp. subsidiary chartered to create "electronic infrastructures" by using traditional data center disciplines to strengthen the Internet/Web for transaction-oriented, mission-critical applications.

Today, Web traffic is funneled over public telephone networks, which Genuity officials argue were not designed from the outset to cope with the rapidly increasing traffic loads. In addition, performance bogs down because the traffic funnels through a small number of network access points (NAP), where Web requests and responses are passed back and forth between different carriers.

Last week, Genuity opened its San Jose, Calif., data center, which connects via redundant fiber links to a NAP two floors below it in the same building. The Los Angeles center will complete the first phase of data center deployment, joining operational centers in Chicago, New York, Phoenix, Washington, D.C. and London.

Genuity launched virtual private network services about a year ago and is now extending these with two Web services — an intelligent routing system called Hopscotch and a Web content replication offering based on Versant Object Technology, Inc.'s Web Propagation Framework.

The company's data centers host routers, hubs, databases and Web servers for Genuity's corporate customers. Web requests come in via the NAP and are then passed to the data centers, which are linked via Genuity's redundant T-3 network. Genuity's patent-pending software technology determines the optimal return path and Web server to respond to the request.

The result, according to Sam Mohamad, Genuity's vice president of marketing and strategic sales, is fast and predictable response times. Genuity will guarantee response times for its customers, based on their priorities and application requirements.

"We're saying to our customers: The Internet is now a business-critical tool, and our focus is on making it perform that way," he said.

PROFILE: GENUITY, INC.

Headquarters:	San Francisco
Founded:	1994, as Internet Media Network; acquired in 1995 by Bechtel Corp.
Purpose:	Dedicated Internet service provider running a high-performance, privately owned IP network for corporate customers, along with a full range of related data center, project management, implementation, Web hosting and consulting services.

Genuity's data center and network architecture is designed to ensure this. The data centers use top-end Cisco Systems, Inc. 7500 series routers, redundant fiber connections and a dual T-3 fiber ring.

Both local-loop and national backbone connections are leased from two separate carriers to ensure constant availability. The data centers run Web servers and databases on an array of popular Unix and NT servers, with database administrators, full data backup facilities, uninterruptible power supplies, air-conditioned, raised floor facilities and complete network monitoring via Hewlett-Packard Co.'s OpenView.

Vendors to boost Web server capabilities

■ Many ways offered to balance loads

By Mark Leon

LOAD BALANCING is catching on as a method for improving Web site availability, but marrying that technology with routing technology may be the next critical step toward improving Web server performance.

TECH UPDATE

During the past Olympics, for example, IBM combined replication technology from its Lotus subsidiary with another IBM technology, code-named Womplex, to help manage the Olympic site. That technology is expected to be commercially available in the first half of this year. (See "IBM adds pieces to Web software vision," Oct. 7, 1996, page 45.)

Also looking to tackle this issue is Versant Object Technology, which has teamed up with Genuity, an Internet service provider that is a subsidiary of Bechtel, to deliver a combined package later this year.

Under the terms of the alliance, Versant will provide replication technology to manage Web content distributed across multiple servers, and Genuity will direct traffic to ease congestion and deliver guaranteed response times.

Versant will supply the Web Propagation Framework, replication software built around Versant's Object Database Management System. Web developers using the framework can propagate and synchronize Web content across as many as 65,000 different sites, according to company officials.

"The goal is always to attract more people to the site, but when you become successful, you can collapse under your own weight," said Felix Lin, director of Internet strategy at Versant, in Menlo Park, Calif.

But replicating sites on several servers only makes sense if traffic is routed to minimize congestion and maximize response times. Hopscotch, Genuity's new routing software, is designed to do that.

"Hopscotch finds the optimal path to the resource that is most available," said Geir Ramleth, CEO of Genuity, in San Francisco.

Hopscotch modifies the behavior of the IP on the 'net backbone. Normally IP will minimize the number of hops a packet takes from source to destination. Hopscotch clocks response time over alternate routes to find the best path to bring end-users directly to a specific server.

Genuity constantly monitors every Internet Network Access Point. Hopscotch uses this data to intelligently route packets.

Also looking at bolstering their Web server capabilities via load balancing are Netscape and Microsoft.

But all of these companies may find that an installed base of customers who are willing to pay for this software might be much smaller than initially thought if the developers at the Massachusetts Institute of Technology (MIT), in Cambridge, Mass., have their way. MIT's Lab for Computer Science is developing routing software that it will offer for free to relieve busy sites.

"We are looking at a scheme to distribute Web pages to many sites," said David Karger, assistant professor at the lab. "We toss popular pages to random sites. Clients just need to figure out where the pages went."

This is done, according to Karger, through the time-honored computer-science method of hashing.

"We hash on the page's URL so that it gets replicated just enough," Karger said.

Better management for Web traffic

The Versant-Genuity partnership is designed to reduce congestion at popular Web sites by replicating sites and routing traffic for optimal response time

(2014) - Citrix appoints Geir Ramleth as chief strategy officer

02/12/2014

Citrix has appointed Bechtel chief information officer (CIO) Geir Ramleth as senior vice president and chief strategy officer.

Ramleth, who will be reporting to Citrix President and CEO Mark Templeton, will be responsible for strategic, technical and operational teams to fully realize the company's vision of a software-defined workplace.

He served as SVP and chief information officer of Bechtel, where he led the company's global transformation to cloud-based workplace services between 2002 and 2013.

He also served as president and CEO of Genuity, a Bechtel Enterprises company formed to deliver Internet and data services until its sale to GTE. Ramleth has also held management positions with Oracle, PageMart Wireless, and PacTel Personal Communications.

Ramleth will be based in the company's Santa Clara, Calif. headquarters.

1997 (May 7) - Patent Application for 61144638 - Multi-Tenant Unit

Description

This application claims priority from U.S. Provisional Patent Application Ser. No. 60/019,089, filed May 14, 1996, naming as inventors Thomas Obenhuber and Rodney Joffe, and assigned to the assignee of the instant application. U.S. Provisional Patent Application Ser. No. 60/019,089 is incorporated by reference herein in its entirety for all purposes.

BACKGROUND OF THE INVENTION

The present invention relates to computer networking systems and, more particularly, to systems and methods of providing Internet access to multiple users at a single location.

The Internet is a collection of thousands of computer networks around the globe. Internet usage has grown exponentially since 1993, mainly due to the world wide web (Web) and its electronic mail (e-mail) and web page capabilities. This interconnection of computers is possible because the Internet has adopted a communication standard (Transmission Control Protocol/Internet Protocol or TCP/IP) which allows computers with different operating systems to communicate with each other over a network of networks (an "internetwork").

By one estimation, over 8 million computers currently attach to the Internet. An estimated 40 million users worldwide access these computers ("hosts").

Corporations and private users increasingly demand easy, cost-effective, and high-speed (e.g., greater than 1 megabits per second or Mbps) access to public interoperable networks such as the Internet. Around the world, the demand for a technical infrastructure for building private networks on top of public networks also is increasing.

As the number of users on the Internet increases, so too do the users grow more sophisticated. Users are demanding greater bandwidth to support this sophistication.

In conventional systems a user might use several different suppliers and components to achieve connectivity and security. The user then has to change equipment and software protocols during his migration from a lower bandwidth (e.g., 56 kilobits per second or kbps) to a higher bandwidth (e.g., 1 Mbps or higher).

Accordingly, there is a need for a substantially simplified infrastructure to access public networks with a reduced number of components, a reduced number of software protocols, enhanced management capabilities for network components, and secure access to the public network.

SUMMARY OF THE INVENTION

The present invention provides systems and methods for providing multiple users with access to a public network like the Internet. A single high-bandwidth connection (e.g., fast Ethernet) allows the multiple users to communicate with the public network. Each user is allocated a specific bandwidth, and the user is able to freely communicate with the public network up to the allocated bandwidth. Additionally, the invention may be remotely configured to change bandwidth allocations. [...]

MULTI-TENANT UNIT

This application claims priority from U.S. Provisional Patent Application Ser. No. 60/019,089, filed May 14, 1996, naming as inventors Thomas Obenhuber and Rodney Joffe, and assigned to the assignee of the instant application. U.S. Provisional Patent Application Ser. No. 60/019,089 is incorporated by reference herein in its entirety for all purposes.

BACKGROUND OF THE INVENTION

The present invention relates to computer networking systems and, more particularly, to systems and methods of providing Internet access to multiple users at a single location.

The Internet is a collection of thousands of computer networks around the globe. Internet usage has grown exponentially since 1993, mainly due to the world wide web (Web) and its electronic mail (e-mail) and web page capabilities. This interconnection of computers is possible because the Internet has adopted a communication standard (Transmission Control Protocol/Internet Protocol or TCP/IP) which allows computers with different operating systems to communicate with each other over a network of networks (an "internetwork").

By one estimation, over 8 million computers currently attach to the Internet. An estimated 40 million users worldwide access these computers ("hosts").

Corporations and private users increasingly demand easy, cost-effective, and high-speed (e.g., greater than **1** megabits per second or Mbps) access to public interoperable networks such as the Internet. Around the world, the demand for a technical infrastructure for building private networks on top of public networks also is increasing.

As the number of users on the Internet increases, so too do the users grow more sophisticated. Users are demanding greater bandwidth to support this sophistication.

In conventional systems a user might use several different suppliers and components to achieve connectivity and security. The user then has to change equipment and software protocols during his migration from a lower bandwidth (e.g., 56 kilobits per second or kbps) to a higher bandwidth (e.g., 1 Mbps or higher).

Accordingly, there is a need for a substantially simplified infrastructure to access public networks with a reduced number of components, a reduced number of software protocols, enhanced management capabilities for network components, and secure access to the public network.

SUMMARY OF THE INVENTION

The present invention provides systems and methods for providing multiple users with access to a public network like the Internet. A single high-bandwidth connection (e.g., fast Ethernet) allows the multiple users to communicate with the public network. Each user is allocated a specific bandwidth, and the user is able to freely communicate with the public network up to the allocated bandwidth. Additionally, the invention may be remotely configured to change bandwidth allocations.

In a preferred embodiment, the present invention provides an apparatus for communicating information packets between each of a plurality of ports (referred to as "user ports") and an additional port (referred to as the "network port"). The apparatus includes a switch for establishing communication paths between each of the user ports and the network port; storage for configuration information regarding the user ports; and a controller, responsive to the configuration information for a given user port, for limiting the flow of information packets between the given user port and the network port.

Additionally, the present invention provides a method for distributing data between a network port and multiple user ports. The method includes for each of the user ports, storing configuration information indicating the data bandwidth allocated to the port; receiving a request to send data between the network port and a selected user port; determining if the current data bandwidth of the selected user port exceeds the allocated data bandwidth; and sending the data between the network port and the selected user port if the current data bandwidth does not exceed the allocated data bandwidth.

Also, the present invention provides a method of establishing respective network connections between a wide area network (WAN) and each of multiple tenant sites at a single location to allow information packets to be communicated between each tenant site and the WAN. The method includes providing a central switching apparatus at the location, including a plurality of tenant ports and an additional network port; coupling the WAN to the network port; coupling at least one computer or a local area network (LAN) at each tenant site to a respective tenant port; and establishing, with the central switching apparatus, communication paths between each tenant port and the network port to provide each tenant with access to the WAN.

Further aspects and features of the present invention will become readily apparent to one of ordinary skill in the art on reading the background above and the description below.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. **1** shows several hardware components and connection mechanisms to access an internetwork;

FIG. **2** shows the present invention combining several OSI network layers;

FIG. **3** shows differences in connection mechanisms between the invention and a conventional system;

FIG. **4** illustrates a functional block diagram of an embodiment of the invention;

FIG. **5** illustrates a hardware block diagram of an embodiment of the invention;

FIG. **6** illustrates a software block diagram of an embodiment of the invention;

FIG. **7** is a flowchart of a software packet filtering process according to an embodiment of the invention; and

FIGS. **8A** and **8B** are flowcharts of a process for forwarding packets through the system according to an embodiment of the invention.

DETAILED DESCRIPTION OF SPECIFIC EMBODIMENTS

The following description uses the Internet as an example to describe in detail the current art of public network access. The invention, however, is not restricted to the Internet and is applicable to other commercially or publicly available networks.

Introduction

Internet access can be gained conventionally through two methods:

Dial-up service through an access provider such as AOL® or Compuserve® geared to the individual occasional user. However, the low capacity of such a dial-up

RE: GTE to acquire Genuity

From: Rodney Joffe

Date: Fri Nov 14 02:15:34 1997

Gordon,

I have to admit that you're right. You really do have all the answers, and you really do know it all.

I guess the fact that there are only two shareholders in Genuity, me and Bechtel, both of whom know exactly what Jon could and couldn't do, and who accepted his conditions when he joined the board, is unimportant. And the fact that Jon knew this, and understood that his fiduciary responsibility in this area was subject *only* to the shareholders, both of whom assured him in terms that he was prepared to accept that they would *not* expect him to or ask him to _abuse_ his position of trust outside of Genuity to assist Genuity unfairly, is irrelevant.

Gordon, I have never been able to quite fathom out why you chose this industry to attempt to make a living, and not the same industry as the National Enquirer. I think you've missed your calling. I only hope your clients realise the true value of your reporting.

So that others are privy to the same information that I gave you, let me be specific (and remember, I don't owe ANYONE an explanation, but I want to undo the damage that your buffoonery has caused);

Bechtel never really had to make a choice about whether Jon joined the board or an advisory board. I nominated him to the board as one of *my*representatives. They didn't know Jon from a hitchiker before this. I wanted someone clueful to help me guide Genuity along a *good* path, and away from the dark side (obviously I passed on asking you). I think I can proudly say that Genuity has been an exemplary internet citizen (I, of course, may not have been).

So when you attempt to to wind people up with your paranoia, you do someone who has done a lot of good for the Internet over *many* years a grave injustice. Fortunately I care more about what honest, good people like Jerry Scharf says, than I do about what you say. If I didn't, I'd probably spend some real energy telling you what I really think.

Does anyone know if Paul's RBL works on a single netaxs address?

Rodney Joffe / Chief Technology Officer / Genuity Inc., a Bechtel company

RESPONDING TO :

> -----Original Message-----

> Subject: Re: GTE to acquire Genuity

May I quote what you over looked: Now I am confident that he has not used his position to give special benefit to genuity.

and later in the same post: Rodney Joffe explained to me in very glowing terms this summer why jon was on the 'board" his explanation sounded fine.

Further explanation - Rodney Joffe told me precisely the same story which i published verbatim.....and more besides..... jon came out pure as the driven snow

I never suggested genuity was harmed. I do state that one of the senior members of the community who knows the laws of the fiduciary legal responsibility of members of boards of directors far better than I pointed out that he believed it possible that a genuity stock holder who was aware of jons proper from the internet point of view, could have taken legal action against jon for NOT making a decision that benefitted genuity and using his powers to act for the fiduciary benefit of the company of which he was a director and for which he had such a legal responsibility.

now I am a r ussian history Phd....read trained as an academic....as is jon.....and most academics aren't terribly aware of these nuances.....so I can understand jon's accepting the directorship.

guess my bitch is why would the presumably legally savvy business staff of genuity/bechtel have put jon however unwittingly into such a position?.

I have been told be those who are also my seniors, that Jon is and "icon" and when one critcizes him one can expect all hell to break loose....looks like my seniors were right.....but it also looks like I owe him no apology.

and before you continue your flame I hope you will look more carefully at what I am saying.

read my original post more carefully this time.

Last time i looked Jon postel was still on genuity's board. It is my understanding that this gives him a LEGAL responsibility to act in the best financial interests of genuity. Seems to me this creates a conflict of interest given what with his powers as IANA he could do to benefit genuity with IP allocations etc. Now I am confident that he has not used his position to give special benefit to genuity. but I am also told that he could be regarded as culpable for not having helped them out when it could be argued he had the power to do so. This is a distinction that I was slow to grasp and one that jon with a research rather than a business background might also be slow to grasp.

Rodney Joffe explained to me in very glowing terms this summer why jon was on the 'board" his explanation sounded fine. Point is Jon could have had the same impact as a special advisor to the board. one wonders why genuity bechtel attornies that could be expected to be aware of these issues went with the board choice anyway.

does jons board position disappear when genuity is fully acquired? i would hope so.

RE: GTE to acquire Genuity

From: Gordon Cook

From: Gordon Cook

Date: Fri Nov 14 11:09:44 1997

Rather than speak ONLY to the facts, Rodney can't resist some very nice name calling and personal attacks because my criticism has obviously offended him. And regardless of what an outsider to the internet might think his motives were of course pure. Let the record speak for itself and let the discussion be taken off line and NANOG be returned to operational matters.

Here, in full, is what I published in my sept 97 issue.

On July 13 Rodney wrote privately to us but for publication: I've been mulling over your request, and I'm not sure how best to answer it. One of the misnomers about Genuity is that we're a start up. **You'll actually find that we were one of the 22 direct connects to the CIX router in Santa Clara already in May of 1994**, so I'd hardly call Genuity a start up. Although we were certainly the smallest, or one of the smallest (Jamie Saker out of Wisconsin at Synergy was probably a similar size), we were very much in business before the Internet truly became mainstream.

Anyway, our early allocations were a couple of /24s, and then a 19/. We had to plead with Kim Hubbard for another 19/, but were successful in getting it only when we promised to be frugal in sub-allocations (she didn't ask for empirical evidence). Then Genuity came in to being (December 1995 when I sold 75% of the company to Bechtel).

At that stage, or soon after, things tightened up. We really didn't have our act together as far as swipping address space that we had allocated to customers, and we began to run out of space. **At the NANOG held in DC in 1996 all of our pleading with Kim fell on deaf ears.... Justifiably on her part (although at the time I felt a 2 x 4 was the best method of improving her hearing)**. So I approached everyone I could for help, including Paul Vixie and Jon Postel. **Jon was very helpful, cuffing me around the ears and telling me to go away and do what the NIC wanted everyone to do, and to set an example**. So, all of our Network Engineering staff got together, and over the course of a week built all the audit tools needed, and SWIPd all the addresses we had allocated, developed an ongoing plan and architecture for allocating address space, then went back to Kim for more space.

Kim looked at the SWIP data, tested the integrity, and then agreed to allocate us more address space in segments, but only if we agreed to return the address space we already had if we wanted to get contiguous space allocated (I am a big believer now in CIDR). We have stuck to this religiously, and have only been turned down twice since then when we have asked for more address space (we had to tighten up more of our sub allocations). So we have not really seen any effect of RFC 2050 (I don't think) because we were already being very conservative before it was published. We maintain a very strict regime with

seen any effect of RFC 2050 (I don't think) because we were already being very conservative before it was published. We maintain a very strict regime with our customers, and actually, although our customers are all corporate users, we commonly allocate /27s to them if they cannot justify more space.

Jon Postel as a Genuity Board Member

You asked how Jon Postel came to be on our board. As far as I know, it is the only board he sits on. He sits in one of my two board positions. He helps me provide the Internet's view to the Bechtel side of the board, so that the decisions they make are for the Internet, not against it. He helps me lend weight to making sure that we help, not hurt. We've funded well into 6 figures of software development through Vixie and Associates. Jon helped make sure that the board understood that making the applications 'freeware' and public domain was a 'good' thing. Hence "Vulture" and " Vulture 2" and Turk, which are available from Vixie's home page, and are used by many. Also we've ended up funding indirectly some of the other stuff that Paul does, related to bind, etc.

Jon made it clear, as part of his involvement in our board, that his connection with IANA etc would be one way - he would be looking for a flow of help in the other direction only. **We've sponsored ISOC at the fullest level because of him, we provide significant services to ISI, JPL, CalTech, and USC, and on the other hand we have disqualified ourselves from opportunities where his influence might have helped** (We will *not* be applying/bidding to be one of the registrars in the new TLD world unless it is clear that the decision making process can be shown demonstrably to be untainted by any connection - currently unlikely).

The interesting thing is that Jon has helped make us a good net citizen in an environment where one would believe that a privately held company with very deep pockets could have instantly become a major force for the 'dark' side.

You would have to ask Jon for his full motivation, but I will tell you that you can spend as much time combing through the records as you want, and you will see that all the apparent advantages have accrued on the Internet's side. From our side, we have managed to build a solid business, based on pretty strong morals and principles, and have attracted some pretty good people who also appreciate the fact that we are able to operate without having to look over our shoulders. Jon was instrumental in this.

By the way, on the few occasions that I have asked Jon questions where he felt a conflict, he has had no hesitation in telling me so. I have respected that. I'd say that Genuity owes some significant part of its success to being guided well by Jon in the good ways of the Internet. And overall I think I can say that the net itself is a better place. [Editor: Unfortunately, we did not recall, until we were going to press, that the member of a Board of Directors of a corporation has a legal, fiduciary reponsibility to that corporation. Thus, contrary to Rodney's assertion about Jon's insisting that his membership not benefit Genuity, it could be said that, if Jon had information about an action that he would take as IANA, and he did not disclose it to Genuity, he might be acting in violation of his legal, fiduciary responsibility to Genuity. If Jon served on an advisory board, this liability would vanish. Unfortunately the web page http://www.genuity.net/about_genuity/officers.html makes it very clear he is a full member of the Board of Directors of the corporation. We see this as one more example that, filled with good intentions as he may be, Jon has gotten in over his head.]

=========

November 14, 1997: since sensitivities are so raw let me make a couple more things perfectly clear. It is my understand that among the original generation of internet founders Jon has likely profited from his full time dedication to the network far less than any one else. I have talked with a lot of people who for various reasons are unhappy with things that Jon has recently done. However not once has anyone person ever suggested that jon did anything for his personal benefit or profit.

NEVERTHELESS: with the internet now a multi billion dollar a year global industry, the same informal standards of operation for IANA that served the internet well up to a couple of years ago are likely inadequate. IANA is perhaps the most critical set of functions in the entire network. the idea that one fallable human being like Jon - however well intentioned he may be and I am sure that he is well intentioned - can be both decision maker and court of last resort on issues as contentious as IP allocation and DNS - is an idea that is losing credibility. Given the last two years of DNS wars - if I may be allowed to have an opinion of MY own - it is especially important that, operating in an arena where most people no longer know him personally, Jon must take great care to avoid even the APPEARNCE of any conflict of interest.

1997 (Nov 13) - GTE Press Release (archived with Verizon) - "GTE Corp. to acquire Genuity, Inc."

Source - [HC004M][GDrive]

IRVING, Texas - GTE Internetworking, a subsidiary of [**GTE Corporation**], today announced that it will acquire **Genuity Inc.**, a subsidiary of Bechtel Enterprises. The terms of the transaction were not disclosed. The acquisition is subject to customary closing conditions, including the expiration of applicable waiting periods under the Hart-Scott-Rodino Act. The acquisition will be completed through **GTE Internetworking's** affiliate, **BBN Corporation**. It is anticipated that the transaction will be completed by the end of the year.

GTE Internetworking, already a leading provider of Web hosting, is pursuing its strategy of enabling customers to transfer their business applications to the Internet. Moving mission-critical business processes to the Web allows customers to broaden market reach, lower the cost of sales, distribution, and support, and transform the relationships between companies and their customers.

GTE Internetworking has more than a thousand Web hosting customers, including some of the busiest sites on the Web--ZD.Net, Four11, LA Times, Boston Globe, Tribune Corporation, and NBC Interactive. The combination of GTE Internetworking with Genuity will provide an expanded global footprint with 12 fully networked data centers, creating an organization with an unprecedented ability to provide distributed Web hosting services.

Genuity is a value-added provider of distributed application hosting solutions. Genuity has strategically located data centers and a sophisticated load-balancing technology, Hopscotch, which together ensure efficient delivery of data across the Internet. Genuity's unique Hopscotch technology helps solve busy server problems, network congestion, and Internet latency to deliver the highest levels of performance. Its customers include cnet, CMP Publications, Inc., Excite, InterTel, and MCA/Universal.

"With this acquisition we continue to build the critical set of assets necessary to advance our position as a trusted provider of the enabling infrastructure for Internet commerce. We are combining our high-speed national backbone with global reach, robust public and private peering relationships, advanced hosting and distributed application management with our security and systems integration expertise to enable customers to migrate mission critical applications and business processes to the network," said George H. Conrades, president of GTE Internetworking.

"Genuity's network technology, and most importantly, its people, are what give us the competitive advantage," said T. Geir Ramleth, president and CEO of Genuity. "The integration of our robust hosting infrastructure and powerful Hopscotch technology with GTE Internetworking's extensive resources will create a synergistic union. And our similar cultures and vision for the future provide a unique opportunity for customers looking to transform their businesses using Internet technology."

"Genuity's robust distributed application hosting architecture will be instrumental to GTE Internetworking as we continue to focus on delivery of the most advanced distributed network-centric solutions," said Mark Shull, vice president and general manager of GTE Internetworking's Network Centric Solutions group. "This combination allows us to build on our existing base of technology and expertise to provide Internet infrastructure services for electronic commerce."

About Genuity

Genuity is a subsidiary of Bechtel Enterprises, the development, financing and ownership affiliate of the Bechtel organization. Genuity is a value-added provider of distributed application hosting, access and security technologies that provide cost-effective, scaleable and highly reliable Internet infrastructure for commercial applications. With headquarters in San Francisco, Genuity also has data centers established in Chicago, Los Angeles, New York, Phoenix, San Jose, Washington, D.C. and London. Genuity is the creator of Hopscotch, a service allowing organizations to ensure the accessibility and performance of their mission-critical Internet sites by eliminating DNS look-up failures and solving Internet latency problems. For more information, please call 1-888-Genuity, or visit the company's World Wide Web site located at Genuity

About Bechtel Enterprises

Bechtel Enterprises, Inc. is the development, financing and ownership affiliate of the Bechtel organization, a premier global engineer - constructor. It is a leader in the privatized infrastructure market, with ownership interests in 9 companies and 29 projects in the power, water, transportation, telecommunications, and technology sectors. Since 1990 alone, Bechtel Enterprises has participated in arranging nearly $12 billion in project financing. For more information about Bechtel please visit the company's World Wide Web site at Bechtel

About GTE Internetworking

GTE Internetworking, a unit of GTE Corporation (NYSE:GTE), includes the recently acquired BBN Corporation, which 28 years ago developed the ARPANET, the forerunner to today's Internet, and GTE Intelligent Network Services, which provides Internet services to consumers and small businesses.

GTE Internetworking offers customers, from consumers to Fortune 500 companies, a full spectrum of Internet services and solutions including dial-up and dedicated Internet access, end-to-end network management, high-performance distributed hosting and applications solutions, managed security, and systems integration, for customers migrating their mission-critical business applications to the Internet. GTE Internetworking draws upon BBN's expertise in funded research and development of advanced technologies, including satellites, digital radio, multi-gigabit routers, security, and speech, and GTE's strong existing telecommunications services, including local and long distance, wireless, paging, video, research, and Internet. The address for the GTE Internetworking's home page is www.bbn.com.

Host of companies compete for business data storage

Hosts rent space on servers to hold programs, data or Web pages

By Jerry Ackerman
Boston Globe

It was only a matter of time, once interstate highways were built, before roadside diners gave way to fast-food chains and mom-and-pop motels were replaced by Holiday Inns, Radissons, and EconoLodges.

And so it is today along the Internet information highway, where a battle is being waged for market share in a roadside service called hosting — storage of Web page text and other content for retrieval by computer users at the click of a mouse.

Along with storage, some hosting companies see the field evolving to include rental of specialized business software, on a per-use basis, to customers who need these sophisticated programs but can't afford their upkeep.

The players range from giants — such as IBM Corp. and GTE Corp., which got into the game last year by buying BBN Corp. of Cambridge, Mass. — to Sage Networks Inc., a Cambridge start-up intent on building a national hosting company by buying smaller operators, and tiny Taylor Group of Bedford, N.H., which is starting from scratch.

The prize is a position in an industry that now has 4,000 to 5,000 hosting companies, which maintain the computers, called servers, that store Internet data. While no hosting company is believed to hold more than 2 percent of the market, these companies had combined sales of $400 million in 1997, according to Forrester Research Inc. of Cambridge. That number is expected to reach $1.9 billion in 1999 and $10.5 billion by 2002.

Tied to online shopping

Underlying this rapid growth is the surging interest in online shopping.

Electronic commerce last year chalked up more than $20 billion in sales, two-thirds of that in business-to-business transactions. Forrester figures that by 2002, this number could reach $350 billion, as existing on-line companies — ranging from home-based enterprises to pioneering bookseller Amazon.com — are joined by retailers such as L.L. Bean, Macy's, and Sears, Roebuck & Co.

Many of the largest of these "e-commerce" companies manage their own servers and networks. But some big players, and most of the small ones, contract this work to hosting companies.

These often are Internet service providers, many of them local companies whose primary business is providing dial-up phone connections to the Internet.

But along with providing connections, they sell service packages that — for an average fee of $300 to $400 a year and frequently much higher for large users — store Web pages, execute orders, and provide software to post purchases to buyers' credit cards while transmitting deposits to sellers' bank accounts.

Still waiting to be tapped, however, are thousands of firms that could sell their products or services over the Internet but haven't tried, and others that have yet to exploit the World Wide Web's full potential.

Software products are coming out almost daily to ease the way, says Joseph Barlett, an analyst with Yankee Group in Boston. "Most companies going with a hosting provider today are not very sophisticated," he observes.

But many that are very savvy are still hiring hosting companies to help guarantee service quality for both external Internet pages and intranet content meant only for employees' eyes.

Forrester says there were 12,000 such "complex sites" last year, and predicts this number will grow to 20,000 by 2002. Many will be managed in-house, but many more firms will be paying thousands of dollars a year to hosting companies.

Looking further ahead, the Internet is on the brink of opening up new ways for companies to conduct their own internal financial and production affairs, using software that until now only large Fortune 500 companies could afford.

Testing the market

Seeing this opportunity, major business software developers such as Lotus Development Corp. (an IBM subsidiary), Microsoft Corp., and Great Plains Software Inc. are market-testing versions of their brand-name products for small companies — firms with 500 or fewer employees — to use via the Internet.

The concept calls for hosting companies to install master copies of such specialized software, and then rent access to users. International Data Corp. of Framingham, Mass. says 25 percent of 900 companies in a recent survey said they liked the idea for payroll processing; others saw a need for such services for economic forecasting or supply-chain management capabilities that they now lack.

"The capabilities in this field are just emerging," said Steven Brand, Lotus' manager for small business applications.

Hosting as a growth business is sharply defined in the "roll-up" strategy being pursued by Sage Networks, which since March has spent more than $20 million to buy eight hosting companies from coast to coast.

These acquisitions — in Atlanta, New York, Washington, D.C., Los Angeles and San Jose, Calif., — form the backbone of what Sage intends to be a national company that can establish brand identity in a now-fragmented market.

"We actually think that through consolidation you can build a large international company," said Bradley Feld, cochairman and one of Sage's founders.

Could become No. 2

By January, he said, Sage hopes to have between 15 and 25 acquisitions under its wing, with more planned for 1999. "We are now one of the top 10 hosting companies in the country and by the end of this year should be one of the top two."

Not that this represents a big market share.

Sage says it has tens of thousands of clients at its companies; some estimate that number is less than 40,000. The firm believed to be the nation's largest hosting operator, Hiway Technologies Inc. of Boca Raton, Fla., claims 87,000 customers.

And the runner-up, Verio Inc., which has 125,000 customers buying connections to the Internet, may be able to claim about 65,000 as hosting customers, based on rules of thumb that industry veterans say are commonly accepted.

Both Hiway and Verio also are pursuing roll-up strategies. Verio, based in Englewood, Colo., is publicly traded. Hiway has an initial public stock offering planned for this year.

Sage's buying spree has included a large, high-speed computer center near Washington, D.C., purchased from IBM Corp., to be the linchpin in the company's operations. A second center is being built in Atlanta, where two of its operating units are also based, at a projected cost of $1 million.

Sage's money comes mostly from a venture fund managed by a New York investment bank, Charterhouse Group International Inc. Patricia Riley, managing director, says Charterhouse has "well over $40 million in pure equity" committed to Sage.

"The way I look at this, you have a market that is growing exponentially and a business that creates profits quickly," she said. An IPO is planned, but no timetable has been set.

GTE, an international telecommunications giant with $23 billion in revenues in 1997, paid $616 million last year to buy BBN, which in 1969, as Bolt, Beranek & Newman, launched the forerunner of the Internet for the U.S. Defense Department.

Today, BBN operates under the name GTE Internetworking, still running key portions of the Internet and selling services to support its parent company's drive to compete against AT&T Corp. and MCI Communications Corp.

"We're shooting to be a leader in the hosting market," says John Vincenzo, a company spokesman.

Still under the BBN flag at the time, the company began commercializing hosting operations at its 11 U.S. locations in 1995, according to senior product manager Christine Silva.

Noticing smaller firms

Going first after large corporations that needed backup storage capacity, the company last year expanded sales efforts to include small and mid-size firms — companies with fewer than 500 employees or sales less than $100 million. Analysts say this sector is where electronic commerce is growing the fastest.

Vincenzo said GTE now has more than 1,000 hosting customers. It acquired one smaller hosting company, Genuity Inc., of San Francisco, late last year primarily because it had a data center that could be a GTE West Coast operations center. More acquisitions are possible.

Coming from a different direction, Dan Taylor, a Bedford, N.H., software consultant, sees new computer hardware technology paving the way for hosting centers to provide small businesses with payroll, engineering, manufacturing control, sales systems, and other software that they previously couldn't afford.

Taylor says the licensing fees for these high-end products, which big companies take for granted, weren't the problem.

It was the cost of hiring someone to install the software, manage its use, and install upgrades, in as many as 200 desktop computers in a medium-sized firm. These information systems managers, who can earn $80,000 to $90,000 a year, also must be available around the clock to solve problems.

The new hardware that is altering this picture is called "thin client" technology, a name that refers to the fact that those desktop terminals are stripped of their software storage capabilities — thinned down — to become terminals that connect to servers that function as a central computer.

May sound familiar

This may sound familiar to anyone who used a computer before the PC revolution , when computer terminals were wired to IBM, Digital Equipment, or similar mainframe computers that were tended behind closed doors by technicians. "The industry is calling it recentralization," says Taylor of this return to the past.

But by requiring that software be installed and maintained only at the servers, operating costs plummet and fancy software becomes more affordable.

Taylor this fall will launch his first application of this approach, installing accounting software in host servers at his company's offices that nearby New Hampshire College will be able to tap, via the Internet, for teaching its business courses.

Simultaneously, his company, The Taylor Group, is discussing the hosting of specialized business applications with New Hampshire's largest private manufacturing company, Cabletron Corp. of Rochester, and with a Massachusetts health care firm, Physicians Quality Care Inc. of Waltham, Mass.

Anticipating success in these pilot installations, Taylor recently bought a 9.5 acres of land in Bedford where he plans to build new offices for his 75-employee company — with 10,000 square feet of space set aside for a hosting center.

Founders - Henry Chip Heflich

https://news.fit.edu/alumni/henry-chip-heflich-73-shaping-the-internet/

Henry “Chip” Heflich ’73, Shaping the Internet

Erin FoxJuly 25, 2019

Chip loves to invent things. He has a knack for spotting trends and identifying opportunities.

Heflich was attracted to Florida Tech for two reasons: its proximity to the beach and its connection to the space industry. While earning his bachelor of science in electrical engineering from Florida Tech in 1973, Chip worked for NASA at Kennedy Space Center on the Saturn V rocket. Chip especially enjoyed his coursework in solid state physics, and after graduation he decided to leave the space industry to pursue a career designing analog integrated circuits for Texas Instruments (TI). Here, his passion for invention and entrepreneurial spirit thrived.

Chip left TI to form a company designing corporate local and wide area network computer systems. Meanwhile, something known as the Internet was taking shape, and that would allow Chip’s technologies to be commercialized. Chip co-founded Genuity with a vision to develop corporate Internet services, including data-center-quality web server facilities, a backbone connecting the data centers to the world, and a distributed web content access optimization platform called Hopscotch. Genuity’s technical innovations were met with rave reviews, and the company was acquired by GTE, ultimately becoming Verizon.

Genuity’s patented technology caught the attention of Mark Cuban who recruited Chip to become chief technology officer for Audionet, an early pioneer in Internet-hosted video streaming. Audionet was later renamed broadcast.com and considered the top destination for Internet streaming content with a record-setting IPO on Wall Street. Broadcast.com was purchased by Yahoo! in 1997 for $5.7 billion, and the rest is Internet history. Chip continued as chief technology officer at Yahoo! until his retirement in 2000 and currently serves as chair of Reflect Systems. “Florida Tech provided a solid launch pad for an exciting career,” said Heflich.

Heflich was featured in Florida Tech’s 60th Anniversary special edition book, “60 for 60: Celebrating Sixty Years of Alumni at Florida Institute of Technology.” Copies are available for purchase here.

GTE Net division to hire 500 in state, change its name

By Ross Kerber
GLOBE STAFF

GTE Internetworking plans to hire 500 e-commerce consultants and engineers in Massachusetts this year to help develop its high-speed data network and offer services as part of a proposed spinout from GTE Corp.

The division, with headquarters in Burlington, also plans to announce today that it will change its name to Genuity Inc. as it becomes a publicly traded company.

The plan is part of a controversial bid by GTE and Bell Atlantic to gain government approvals for their $84 billion merger plan, which would create the country's biggest local phone company.

Currently, the GTE unit employs about 2,000 people in Massachusetts and 3,500 in all. It includes most of the assets of the former Bolt Beranek & Newman in Cambridge, which GTE bought in 1997 for $616 million. GTE says the unit had revenue of about $1 billion last year but wasn't profitable.

In 1969, Bolt Beranek was one of the Pentagon's first contractors for the computer system that became the Internet. More recently, the company has operated high-speed data connections for big corporations and Internet service providers. In February, it won a contract from America Online Inc., estimated to be worth more than $2.5 billion, to install new connections for the service provider.

If the Genuity spinout is approved, said GTE Internetworking's president, Paul R. Gudonis, the company would become one of the top four providers of Internet connectivity services, along with Sprint, WorldCom, and UUNet. To compete, Gudonis said, Genuity will offer more consulting services to help companies create corporate Internets and business-to-business services for e-commerce. Gudonis would be head of the new company.

The future of the division remains a touchy issue before regulators, however. In filings with the Federal Communications Commission, GTE and Bell Atlantic had proposed to spin off the unit as a public company and keep a 10 percent ownership interest, with an option to increase that to 80 percent within five years.

But competitor AT&T says that would leave those companies effectively in control of the unit. AT&T wants the FCC to insist that Bell Atlantic make more commitments to open local phone service to competition. The FCC is considering the arguments and hopes to rule on the merger by July.
